Law: History of Its Relation to the Social Sciences

W Tim Murphy, London School of Economics, London, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

The history of law's relation to the social sciences requires unpacking the multiple meanings in play on both sides of the relation. 'Law' as a general term covers the two very different decision-making processes of adjudication and legislation. 'Social science' encompasses a wide range of epistemic projects ranging from highly positivist engagements to highly interpretive ones. These social scientific projects have increasingly stripped themselves, in different ways, of the various legalisms that once framed them. At the same time, as they successfully establish themselves as autonomous epistemic practices or sources of scientificity, both legislative and adjudicative practice expand the horizons of relevant knowledge on which to draw for legal purposes.

This article first considers a number of problems of definition that arise in relation to the terms 'law' and 'legal science.' The implications of two broad images of law – law as legislation and law as adjudication – are explored in order to sharpen the focus of the question of the relationship between law and the social sciences. Three specific aspects of that relationship are then discussed: (1) the relationship between law, legal theory, and social theory; (2) the relationship of law to the interpretive and/or phenomenological branches of the social sciences; and (3) the relationship of law to the empirical or positivistic branches of the social sciences. In each case, the influence of law upon the development of the social sciences, and the limits of these influences, is considered.

Any attempt to discuss the history of the relationship between law and social science encounters a number of problems of definition. For the purposes of this contribution, it is most important to draw attention to some of the problems that can flow from the range of meanings attached to or associated with the term or idea of law. Deriving from this range of meanings, the variety of projects associated with the idea of a legal science can be problematic. As a result of both of these elements, when an attempt is made to formulate the boundaries of the question about the relation between law and the social sciences, indeterminacy results.

Two Images of Law

At its simplest, the idea of 'law,' at least in Occidental or even Indo-European culture, conjures up two broad images. One is of legislation or rule making. The other is of adjudication or judgment. Cognate distinctions, for example, between law and policy or law and politics, and principled statements of the supposedly modern requirements of a democratic order (e.g., the doctrine of the separation of powers), all play with or draw upon this much more deeply rooted distinction, tension, and ambiguity in the idea of law. And even this primordial distinction becomes more complicated with the emergence of a self-thematized modern era, in which the idea of law as rule making falls apart or splits into two broad patterns. One pattern is the idea of making highly general, abstract, decontextualized rules that establish the framework to govern the operations of society (the so-called European codes; for this, see van Caenegem, 1987); and the other is the idea, which persists in Anglo-American or 'common law' jurisdictions, that rule making is a matter of detailed, specific rule making targeting specific problems that come to the attention of the legislator (whether, in the traditional model, through deficiencies brought to light in the course of adjudication, or, in the modern model, because of problems demanding policy adjustments that come to light in, for example, governmental bureaucracies through the growth in knowledge of the shapes and characteristics of society and its pathologies). Some have argued that, at least in the common law world, the increasing volume and significance of legislation so overwhelm our idea of law that it comes to be projected back onto the activity of adjudication, which comes to be understood as a kind of inferior lawmaking, rather than a distinct process with its own specific forms of intelligibility (Simmonds, 1984). Since Bentham (and, to some degree, Montesquieu before him), the idea of a link between a science of legislation and a science of society has seemed obvious. More obscure to social science is the idea of adjudication as such a science. Paradoxically, perhaps, the view has long been generated from within the discipline of law that it is in the domain of adjudication or adjudication-related activities that a knowledge of society is both required and developed, and from this perspective acts of legislation are seen as arbitrary or at least as the product of political will rather than an understanding of society. This kind of lawyer-knows-best attitude carried over, especially in England, into the new encounter between adjudicators and social scientists, especially in the sphere of criminal justice and criminology.

Law and Social Science

It is necessary to highlight these divergent emphases because there persists an enthusiasm in many quarters, and by no means just among lawyers, to thematize the idea that law is the oldest social science, that law was and/or remains a 'science of society,' and, in some versions, that the modern social sciences represent merely a continuation of this science or, in some cases, a derogation from it, a diminution in what society knows about itself.

The question of the relation between law and social science and the history of this relation are further confused or complicated by many of the uncertainties involved in the

specification of what is or is not within the ambit of social science. Confining this enormous issue to a narrow focus for our present purpose, we need to distinguish three questions. The first concerns the relation between law and the empirical or positivistic branches of the social sciences. The second concerns its relation to the interpretive and/or phenomenological branches of the social sciences. The third, which cannot neatly be separated from the second, is about the relationship between law – or, to switch gears, legal theory – and social theory, which becomes relevant if we assume that there is some kind of connection or link between the conceptualizations of social theory and the problematizing that emerges in the diverse fields of the empirical social sciences.

It is perhaps unsurprising that the closest affinities and even influences between law and social science seem to emerge in the domain of social theory. It is increasingly acknowledged that the writings of some of the founding fathers of social theory, and (indirectly perhaps) of sociology, had a legal background and that their theoretical constructions and projects bear the imprint of legalistic or law-inspired concerns. If, however, this is true of both Durkheim and particularly Weber (Turner and Factor, 1994), then this observation does suggest that legal influences and origins could have led late-nineteenth-century aspiring social theorists to formulate very different questions and very different theories of society, assuming that the construction of 'social theory' was what they sought to achieve. A legal background, in other words, did not seem to lead to any particular kind of theoretical orientation. In something of the same spirit, one of the leading postwar texts in legal theory describes itself as an exercise in 'descriptive sociology' (Hart, 1961). This focus makes it possible to see strong continuities between law and (the theory underpinning) social science. Some contemporary political philosophers (Rose, 1984), lawyer/psychoanalysts (Goodrich, 1997), and historians of political thought (Kelley, 1990) have not hesitated to drive home the point, with the polemical claim that modern social theory masquerades as different or new, whereas the basic framework of Western social thought is already contained in the law and indeed the tradition of law already contains a more sophisticated understanding of the central issues than much modern social theory.

Alternatively, some influential theorists adopt what is more or less the opposite position (e.g., Foucault, 1976; Luhmann, 1981). On this view, there is a sharp break between an era of social thought in which law provides the basic conceptual scheme for understanding society, and the modern or late-modern era in which this vision of society is undermined or displaced by the growth of positivistic social sciences. Hacking (1990) encapsulates what is perhaps the central dimension that underlies this view of historical change in contrasting the role played by the concept of the 'normal' in the projects of Durkheim and Galton, respectively. Durkheim's notion of the normal is still legalistic; in Galton, it becomes entirely probabilistic. And in Hacking's view, it is Galton's version in the twentieth century that wins – in science, at least.

The second area is the relation between law and the interpretive social sciences. Here, the connections are in one sense much clearer and more visible, especially if we have the 'European' law-as-code model of law in mind. At first sight, this seems to be a terrain on which law, history, and interpretive social science meet in the sense that they are engaged in the same kind of endeavor. This is because each is engaged in an exercise of interpretation, and the paradigmatic interpretive situation is the 'presence' of a text that is in some sense 'other' to the person required to interpret it. In hermeneutical science, for example, the enterprise of interpretation from this starting point is characterized as precisely a bringing together, via the text of author/creator and reader/interpreter and as the quest for a fusion of horizons, a merging of perspectives that endeavors not to transcend temporality (as does analytical philosophy) but to make it work, productively, at both ends of its spectrum. It is apparent, viewed historically, that this style of science (whether it is 'scientific' is not a question for this contribution) owes much to law and just as much to theology, and to the study of texts in each discipline in the universities of medieval Europe (Smalley, 1983). Already in these disciplines, interpretive protocols had been formalized, and their shapes were largely carried forward into the emergence of more explicitly philosophical projects by the eighteenth century. Many have traced an unbroken genealogy from that point, in the writings of, for example, Boekh and later Schliermacher through to Gadamer (1965) and contemporary practitioners of this approach to 'truth' (Rorty, 1979). Much was made of 'meaning' in these narratives of the history of a partial discipline-under-construction, and therefore in many versions Weber or *Verstehende Soziologie* were annexed to the narrative as part of the same story. 'From the actor's point of view,' a slogan variously popularized (at least within the academic world) by Malinowski and Geertz (1973, 1988), could lay claim to being the heir to this perspective or 'methodology,' and claims that this involved a direct succession to the lawyer's perspective that, for example, '*actus non sit reus nisi mens sit rea*' (the doctrine of *mens rea*, which seemingly involves investigation of inner mental states and 'intentionality' and its degrees) possessed and still possess a certain plausibility.

But it is precisely at this point in the history of law and the social sciences that continuities may need to be balanced by discontinuities. First, the once-innovative proposition that social science can proceed on the basis that culture is a text has been much debated and criticized (e.g., Clifford and Marcus, 1986). Second, political and legal anthropology in particular have raised a number of questions about the tendency in earlier studies to posit a 'jural perspective' when investigating acephalous (lit. 'headless') societies, which presented a particular challenge because no visible structures of government or law in the familiar Western sense were available for outside observers to observe (which is not to say that they could not find them virtually present) (Comaroff and Roberts, 1981). Under the influence in part of some of this work, some historians came to question the top-down model of social integration and/or development that has had a habit of permeating social as well as political history.

The net result of these overlapping concerns has been to move away from or be suspicious of the deployment of a 'juridical' model in the interpretive social sciences, and this has served to highlight the difference in the concerns or preoccupations of lawyers and social scientists. For lawyers, the key question is what beliefs, assumptions, values, or intentions it is reasonable or rational to impute to actors or legal subjects. Therein lies the craft, one might say, of the law,

and there is nothing new about this. Social scientists making use of interpretive procedures are increasingly concerned with understanding or uncovering the logic of individual and social action, including motivations, aspirations, and intentions, and they use concepts like culture, horizon, context, and situation to help render these intelligible. These social scientific ambitions are not new, but a combination of background factors (e.g., postcolonialism) and increasing sophistication in formulating these components means that interpretation has lost what innocence it ever possessed, and that the kinds of protocols employed by lawyers whenever they need to concern themselves explicitly with actors rather than texts are increasingly divergent from the highly reflexive methods now required of social scientists. Indeed, legal self-understandings have come to look to these interpretive disciplines for some corrective to what are increasingly perceived to be deficiencies in epistemic capacity and practical deliverability within the legal world itself. The sharpest symptom of this (although appearances can sometimes deceive) is the rapid rise to prominence in policy making, especially in the Anglo-American common law world, regarding the adjudicative process of alternative dispute resolution, an approach to conflict resolution that has unambiguous roots in 1950s colonial and postcolonial anthropology. One example can perhaps serve as a sharp reminder of how far apart in some respects the preoccupations of the law and of modern interpretive social sciences have become. For the law, an axiom of prudence and indeed an operational condition of possibility has more or less forever been the postulate that '*ignorantia juris haud excusat*' (lit. 'ignorance of the law does not excuse'). Contrast this with the role that '*docta ignorantia*' (learned ignorance) played in Bourdieu's not-quite-Marxist sociology of domina-tion (Bourdieu, 1980). Axiomatically, the law disregards what people claim they do not know (based on the suspicion that such disclaimers are easy to make and dubious in the first place – a protocol rooted in skepticism, in other words). By contrast, Bourdieu perhaps led the contemporary field in focusing on a modern version of Marxist false consciousness, detached from economic determinism as such, but emphasizing the prison-house of cultural schemes that prevent people from knowing what they do. What for the law is something to be ignored is for the social sciences something to be explored. For the law, ignorance is sterile; for social sciences, it is productive.

Law and the Empirical Social Sciences

What is surely unambiguous is the relationship between law and the development of the empirical social sciences, especially to the extent that these sciences are underpinned by the burgeoning of statistical knowledge and growing sophistication in statistics-gathering methods and techniques. Yet this contains within itself new ambiguities. Specifically, at least at the level of images of truth and the supporting rhetoric or legitimation strategies available to science, it is noticeable how a number of writers from the side of science – including natural science – seek to invoke the image of the law court or some of its components – notably, the jury – as the central basis for the image of truth or of what it means to claim validity for scientific statements. Trial by your peers has much ideological resonance, especially in North America; but whether it is more than a cultural theme or idiom is a more intricate question that requires explicit if not detailed discussion here.

The metaphor of scientific truth as something resolved in a court of appeal in which the judges or jury decide following adversarial confrontation is a powerful and longstanding one in Western thought, albeit one that is by no means universal (see Lloyd, 1996; Needham, 1969). While it is not the same idea, it dovetails with the notion of truth as a matter of a gentlemen's agreement (Shapin and Schaffer, 1985; Shapin, 1994), which in turn rests and relies upon the presence of implicit paradigms that are not themselves usually open to inspection or discussion (Kuhn, 1970; Foucault, 1966). Yet all of this perhaps amounts to little more than the recognition that truth is contestable and the claim that scientific practice has developed – or has always possessed – procedures for resolving epistemic conflicts that arise in the natural course of scientific discovery and invention.

These metaphors of judgment (whether by judges or juries) draw upon the experience of the world of law but do not in reality replicate it. It is interesting to note that they appeal rather more to the common law adversarial style of legal argumentation in the courtroom than the so-called inquisitorial style of the European codified tradition. But whatever precise analogy is used, it runs the risk of obscuring the important and significant gulf that opens up in the modern world between legal science – or the practice of adjudication – and empirical social science.

The most significant here is revealed in the distinction between the level of the individual (for lawyers, a 'subject,' and for many social scientists, an 'actor') and the aggregate or collective ('society'). The law has been and remains concerned with disputes between individuals, with the attribution of liability to individuals, and with the language of individual responsibility. All of this requires a focus, much of the time, on individual mental states, on postulates about what these can be taken to be or how they can be sensibly understood – or on appeals to 'ordinary people' to use their own experience of life to decide what they believe or disbelieve in the claims about such matters made by the parties in court. Judges operate within a similar framework, although they bring to their decision making the added rigmarole of professional training and/or experience with previous kinds of problems or disputes in a forensic setting. In other words, legal schemes combine two types of individualism – the individual as decision maker relying on his or her experience and capacities to draw analogies from this reservoir of experience in order to make decisions, and the individual as the object of decision, as a person who can be assumed to be like or not like the person asked to make a judgment, in matters relating to responsibility for events or actions. The law, therefore, struggles with supraindividual entities like corporations, states, nations, and cultures. Can a corporation be made liable for manslaughter or culpable homicide? This individualism of the law extends beyond persons and into events. A typical legal scenario, for example in the field of tax avoidance, is the problem of deciding whether a chain of events is to be understood as a multiplicity of individual events or as

a composite ('quasi-individual') event. For lawyers, these are not simple questions.

Empirical social science, by contrast, is preoccupied, at its most subtle, with the often perplexing relationship between 'micromotives' and 'macrobehavior' (Schelling, 1978). Correspondingly, individualization of events is of much less (if any) interest than patterns, tendencies, logics, and trends. Critical to these perspectives are perhaps two modern capacities – measuring and modeling. And underpinning these new epistemic possibilities are modern notions of probability and of statistical thinking that diverge sharply from the traditional idea of probability still largely at work in the ideational schemes of the law (Hacking, 1975; Porter, 1986; Gigerenzer et al., 1989; Murphy, 1997).

These developments challenge legal schemes of reality. They create a reality through practices and procedures that are remote from the mechanisms through which law constructs 'its' truth. Surveys, data analysis and number crunching, the quantification of the qualitative (and the very emergence of an explicit distinction between these two, and the consequent problematization of the relationship between them), and probabilistic judgment – all these epistemic practices are quite different from the argumentative, judgmental, and commonsensical manner in which law decides what is true. Even before this became obvious, there were pressures upon law to acknowledge what was changing and to incorporate into itself the findings or the protocols of social science (most famously in the so-called Brandeis brief in the United States, in which statistical information was introduced into court as part of the case). In modern US and UK laws, for example, a concept of indirect discrimination has been introduced, which makes it unlawful to discriminate not just intentionally but also by applying to, for example, job applicants a requirement or condition with which members of the protected group – principally race or sex, but these definitions can be expected to expand over time through new legislation – are disproportionately unable or less able to comply. This kind of formulation inevitably invites the introduction of statistical data into the forensic setting. Other outputs of modern social and behavioral sciences increasingly find their way into such settings, notably in criminal law and family law. Social inquiry reports for offenders before sentencing, or all manner of inputs on child welfare, have come to play a role in the way that cases are disposed of in the areas of sentencing and child custody disputes. It is also increasingly the case that the output of the social sciences plays a role in the evaluation of current law, and generates critique, proposals for new legislation, and arguments for changes in the outcomes of judicial decision making.

These kinds of developments lead some observers and commentators to discern a historical process at work in which the legal sphere steadily succumbs to the influences of the social and behavioral sciences. Foucault's thesis about normalization and disciplinary power (Foucault, 1975), for example, can be read in this way (see also Donzelot, 1977). Others stress, rather, the rise of differentiation. Among many legal theories if not social theories, one of the most influential has been the function-systems theory of Niklas Luhmann (1984). At its simplest, what is at issue here is whether the 'worlds' of law and of social science are converging, merging, or pulling further apart. The answer is probably that both tendencies are simultaneously visible. Convergence, of course, now means the 'colonization' of law by social science, and this is most likely to occur in the area of individual and especially cognitive psychology. In the future, we can anticipate that genetics will play a greater role here. But pulling in the opposite direction are strong tendencies toward the assertion of legal autonomy, in the international as well as national and subnational spheres. As often in the previous history of law, legal thought often proceeds ahead of successful institutionalization, while without the latter the former remains stuck in the ebb and flow of opinion and fashion. However, to the extent that this tendency toward autonomy is becoming a 'reality,' it potentially means that the pre-social-scientific epistemic schemes of the law will succeed in extending their life and even consolidating their position into the future, disregarding the findings of social science on the grounds of increasingly abstract principle.

Abstract

Legal mobilization refers to the social processes through which law is invoked in situations perceived as problematic. In liberal democracies, much of legal mobilization occurs in the activation of legal rights, emerging out of processes through which people transform the meaning of injurious situations and seek redress for them. Multiple contextual factors influence this process, including social hierarchy, interpersonal relationships, culture, and organizational and institutional (legal) structures. Collective legal mobilization is often aimed at social change with both instrumental (indirect/direct) and constitutive effects. Cutting-edge research has begun to examine legal mobilization across multiple contexts, including authoritarian regimes and transnational fields.

Legal mobilization refers to the social processes through which law is invoked in situations perceived as problematic. Such invocations can occur reactively as individuals or groups bring complaints to a legal system or by legal officials acting proactively (Black, 1972).

Individual-Level Mobilization

Research on individual-level mobilization arose out of the realization that North American and Western European legal systems are largely reactive and rights passive unless activated by citizens. To study this activation, scholars developed the 'transformative' approach to legal mobilization that focuses on how individuals make sense of situations they perceive to be normative breaches. The beginnings of such transformations typically involve 'initially amorphous and indistinct' social interaction in which it is unclear whether a normative infraction of any kind has occurred (Emerson, 2008: 485). Felstiner et al. (1980–1981) conceptualize these transformations as unfolding in unstable and incomplete stages, beginning with the 'naming' of an experience as a personal injury and/or rights violation; continuing to 'blaming' in which one party attributes fault to another party for an injury; and then moving to 'claiming' at which point the injured party voices their grievance to the party or parties believed to be responsible and seeks redress. In this formulation, if a claim is rejected, the process transforms into a 'dispute' and third-party involvement (e.g., by police or a court) becomes more likely.

In the United States, the only national survey of individual-level legal mobilization to use random sampling, the Civil Litigation Research Project (CLRP), found in the 1970s that only a small fraction of situations perceived as injurious evolve into disputes and an even smaller fraction, less than 5%, reach a trial stage. This aggregate natural history of legal mobilization in American society came to be conceptualized as the 'dispute pyramid,' with a broad base of recognized grievances and rights violations, yet dramatic attrition as one moves up through blaming, claiming, and finally to the dispute stage and legal intervention (Sarat and Miller, 1980–1981).

Despite the seemingly linear representations in both the 'naming, blaming, claiming' and 'dispute pyramid' approaches, neither model was intended to represent the process of legal mobilization as a completely orderly or linear process. Empirical work on legal mobilization underscores its nonlinearity. For example, a British survey documents how people cycle among self-help, consultations with citizens' advice bureaus, and the mobilization of legal officials. As aggrieved persons move through these contexts, their understandings of their disputes can change, oscillating back and forth along a continuum between more amorphous senses of trouble (akin to prenamed, anomalous social interaction) to more sharply defined grievances (Genn, 1999). Such indistinct and nonlinear processes also appear in Ellickson's (1991) study of how ranchers in Shasta County, California, settle disputes. When faced with property damage caused by cattle wandering across property lines, ranchers and others do not move in a linear process from attempts at informal remedies to claiming liabilities based on the laws of trespass. Instead, they resort to congeries of gossip, mild forms of physical retaliation (to the offending rancher's property), and negotiated attempts at remediation until an outcome is reached.

Although a steady stream of research has focused on individual-level legal mobilization in the United States and Europe, it is also useful to remember that anthropologists have studied legal mobilization as one form of social control across a broad array of cultures, including societies without state-based legal systems. Legal realist law professor Karl Llewellyn and anthropologist E. Adamson Hoebel's (1941) early classic, *The Cheyenne Way*, provided an important point of departure by introducing the 'trouble case' as a conceptual and methodological tool to study breakdowns in routine societal processes and responses to them via lawlike mobilization and other types of social control. Trouble cases are important, so Llewellyn and Hoebel argued, because they both reflect and help compose the sociocultural contexts in which they are embedded. Anthropologist Laura Nader built on Llewellyn and Hoebel's work to coin the concept of the 'disputing process' as an analytic window through which to peer cross-culturally into social situations when everyday social injustices are challenged, remedied, or reproduced by legal and other actions (Nader and

Todd, 1978). Resonant with CLRP and subsequent research, findings point to the mobilization of law or lawlike, third-party settlement agents, such as judges or tribunals, as relatively rare in human societies among all mechanisms for addressing social wrongs. Far more common are attempts at unilateral actions to repress or change normative breaches, dyadic negotiations, avoidance, or toleration (Black, 1993).

Taken together, these approaches and findings have led to a reconceptualization of individual-level legal mobilization in contemporary American contexts as a multidimensional process in which many kinds of actions can occur sequentially and simultaneously, including the possibility that people can enforce their rights extralegally. In their 'multidimensional process model' (MPM), Morrill et al. (2010) characterize legal mobilization as emerging out of a pool of perceived legal violations (which can have initially amorphous parameters and tenuous links to law) and comprising multiple modes of action: (1) formal legal action, such as filing a formal lawsuit, filing a formal complaint with a government agency (e.g., the United States Equal Employment Opportunity Commission or the European Commission on Human Rights), or contacting a lawyer; (2) quasi-legal action, such as using formal complaint procedures or internal dispute resolution forums (e.g., mediation, peer counseling) provided by an organization (e.g., a corporation, government agency, school, or church); (3) extralegal action, such as contacting the media, directly confronting a person verbally or physically, seeking support from a counselor or religious professional, avoiding the person, talking with peers or family members, or engaging in prayer; and (4) doing nothing ('lumping it'). **Figure 1** overlays the MPM (drawn from Morrill et al., 2010) on the outline of the classic dispute pyramid. With the exception of doing nothing, these responses are not mutually exclusive as individuals can pursue several strategies at once. Moreover, they may not unfold in temporally linear ways (e.g., from more formal to less formal or vice versa) given the social contexts in which they are embedded (Emerson, 2008). Instead, these strategies can operate as potentially reinforcing. Or they can be in tension with each other depending upon their salience and meaning in particular sociocultural and legal contexts. By conceiving of mobilization as a multidimensional process, this approach may reveal a broader range of options that people have for mobilizing their rights apart from law itself. This framework also can facilitate examining how people combine different options as they mobilize law and other mechanisms to pursue their rights. Ultimately, the MPM may enable a richer understanding of the roles that law plays in lives of individuals.

Contextual Factors Influencing Individual-Level Legal Mobilization

A growing body of research suggests that a variety of contextual factors based in social demographic, interpersonal, cultural, organizational, and institutional dynamics influence the individual mobilization of law. Various studies have found that individual attributes like race, gender, social class, and citizenship status affect the likelihood that a person will mobilize legal protections. For example, the high cost of litigation deters the poor from exercising legal protections. Additionally, interpersonal ties can influence whether and how people perceive normative infractions with social intimacy tending to channel claims away from disputing and third-party intervention. Legal consciousness – the cultural schemas that individuals draw on for their common sense understandings of law – may also alter a person's willingness to use legal remedies. And organizational structures and broader social institutions can impede or redirect individual attempts to mobilize the law.

Generally, members of socially or economically disadvantaged groups are often less likely to mobilize legal protections. Members of these groups also suffer from worse litigation outcomes. One of the earliest observations of this phenomenon came from Carlin et al. (1966), who found that although the poor were more likely to need legal services, they were actually less likely to mobilize their legal protections. The poor suffer more frequently from consumer fraud, illegal rent practices, and law enforcement abuses. But since the poor lack resources and often experience negative or hostile interactions with the law (particularly the police), they turn to law to solve problems less frequently than their wealthier counterparts. Later empirical studies verified these findings. For example, Mayhew and Reiss (1969) found that family income and property ownership strongly shape how and what people perceive to be violations of the law and predict an individual's proclivity to mobilize the law. This conclusion is not surprising. Given the high cost of litigation, individuals hoping to gain access to legal forums face high economic entrance barriers. This realization spurred the access to justice movement in the 1970s and 1980s, which in turn led to a proliferation of community-based walk-in legal clinics and alternative dispute resolution agencies. Contemporary studies expanded these findings by noting that other demographic characteristics, such as race, gender, and citizenship status affect the probability of legal mobilization. And in the last few decades, scholars have also observed that intersectionality – a person's overlapping membership in multiple demographic categories – uniquely disadvantages individuals in exercising their legal rights (Crenshaw, 1989; Best et al., 2011).

Apart from demography or material resources, relational closeness appears to 'suppress the invocation of legal rules in dispute processing and conflict management' (Morrill et al., 1998: 644). In socially intimate dyads, for example, those in

conflict are likely to have a future orientation to their relationship, which embeds the stakes and management of their conflicts in the interpersonal norms governing the relationship itself. Strong social ties in dyads thus lead away from third-party intervention unless dyadic remedial actions fail (Emerson, 2008).

Legal consciousness also influences whether a person will turn to the law to resolve a dispute. Individuals resolve conflict differently, due in part to their relative awareness of legal rights and understanding of the role of law in society. Ewick and Silbey (1998) have identified different categories of legal consciousness that predict how a given person will utilize the law in the event of a conflict. They predict that politically disenfranchised groups often distrust the law, and are thus unlikely to use the legal system to resolve grievances. Conversely, groups with power find the law accessible. These groups more commonly invoke legal protections in times of need. Thus, this theory may explain why certain racial minorities and socially disadvantaged groups are less likely to mobilize legal protections.

Abrego (2011) provides a compelling empirical investigation of Ewick and Silbey's approach to legal consciousness in the context of undocumented immigrants in the United States. In the US, all undocumented immigrants are technically violating the law by residing in the country and yet their legal consciousness varies quite a bit. Persons who migrated to the US without documentation during adulthood generally fear and are unwilling to mobilize the law, viewing the law as a source of possible deportation and punishment. They feel responsible for unlawfully entering the country and are more 'willing to accept their marginalized status in society' (Abrego, 2011: 363). By contrast, undocumented persons who migrated to the country as young children are less fearful. They have occupied legitimate spaces in the country by participating in public aspects of the society in ways parallel to documented persons (such as attending and graduating from public schools) and do not view themselves as marginal members of society or law as a source of fear, but instead as a source of unwarranted stigmatization. Abrego (2011: 363) concludes that while "stigma can certainly be a barrier to claims-making, the threshold to overcome it is relatively lower" than fear.

Yet another influence on individual-level legal mobilization can be found in formal social organizations, particularly large bureaucracies. To explain "why the haves come out ahead," Galanter (1974) originally drew the classic distinction between litigants who are 'one shotters' and 'repeat players'; the former typically being individual persons and the latter, bureaucratic organizations. Bureaucracies have distinct advantages compared to individuals in legal mobilization, including being able to anticipate 'repeated litigation' and 'pursue long-term interests' with specialists able to structure transactions in advantageous ways by lobbying or litigating to secure favorable laws (Galanter, 1974: 98). In the decades since Galanter (1974) made these observations, large organizations have increasingly 'internalized' the law by creating organizationally based dispute resolution procedures, expanding the prominence of in-house counsel in organizational decision making and disputing, and creating private police/security forces (Edelman and Suchman, 1999: 943). Although much of organizational conflict only rises to the level of disputing under particular organizational conditions, dispute resolution forums can channel both the ways that individuals perceive injurious situations and whether and how they mobilize the law (Morrill, 1995). By setting up dispute resolution forums, organizations in theory could provide employees with an affordable and efficient avenue to resolve disputes both with each other and with the organization. However, dispute resolution structures, especially when they are unmoored from third-party organizations, such as unions, who might balance power asymmetries for employees, run the risk of 'managerialization' in that they come to reflect the institutionalized interests of official, organizational authority (and entrenched powers in broader industries and fields of which they are a part) rather than employees who would be most likely to use them (Edelman, 1992). Indeed, an employee bringing a claim against their employer to an alternative forum might have to present their case to a judge or arbiter "who is a member of the organization's management team" (Edelman and Suchman, 1999: 966). Such forums, therefore, could ultimately suppress employee claims either out of fear of retaliation from the organization or simply because employees give up, believing such forums to be a sham.

Intertwined with the power of organizational structures to shape individual-level legal mobilization are social institutions. The concept 'social institution' refers to macrolevel social structures of meaning and organization. Examples of social institutions include the family, gender, race, or markets. Social institutions can influence both how people view and make sense of law (legal consciousness), as well as how they mobilize what they define as their rights. Marshall's (2005) study of legal mobilization in the wake of unwanted sexual attention in the workplace provides a poignant illustration. Managerial interests and institutionalized expectations of male–female relations shape policies intended to protect women from unwanted sexual attention. As a result, these policies often lead to managerial skepticism about the character and pattern of unwanted sexual attention. Women may anticipate this skepticism and develop strategies apart from legal or quasi-legal responses, including avoiding the person or persons they hold responsible and/or seeking emotional support to cope with the trouble. The interplay between organizational structures, social institutions, and practices thus enacts "a legal consciousness that reflects a narrow meaning for 'sexual harassment'," thereby discouraging legal mobilization (Marshall, 2005: 84). Similarly, Nielsen (2004) finds that the social institutions of gender and race pattern how individuals respond to remarks they deem as racist or sexist in public contexts. While all persons find offensive public remarks to be a serious social problem, white women and persons of color are more reluctant to turn to law than white men because of their skepticism that the law can be used to solve their problems and their fear that law 'would be used against them' (Nielsen, 2004: 2).

Other researchers find that legal mobilization is not only shaped by existing social institutions but is able to challenge them. Albiston (2010), for example, studied the role of social institutions on individual mobilization of legal rights under the Family and Medical Leave Act (FMLA). The FMLA provides up to 12 weeks of unpaid leave per year for workers in the United States who have family medical crises, but the meanings of the rights it confers and their mobilization by both men and women are conditioned by institutionalized workplace norms

about the meaning of work being a 'full-time, year-round endeavor' with the most common family configuration being the male breadwinner/stay-at-home housewife model (Albiston, 2010: 1, 5). These institutions can suppress rights mobilization by both men and women or lead to difficult negotiations with bosses about what is possible under the FMLA umbrella. Nonetheless, Albiston (2010) argues the mobilization of rights under the FMLA that can create opportunities for interrupting institutionalized expectations regarding family configurations and workplace norms as FMLA rights become legitimated and their mobilization normalized. Likewise, Levitsky (2008) argues that Americans remain reluctant to define health care as a 'right or entitlement of citizenship.' Instead, they imagine solutions to unmet health needs within existing institutionalized beliefs about families, markets, and the welfare state. At the same time, new needs compel individuals to articulate new claims, legal and otherwise, about health care thus challenging existing social arrangements but within the existing welfare state framework.

In the most ambitious theoretical project devoted largely to individual-level legal mobilization, Donald Black (1976) stitches together a broad array of the findings from cross-cultural research to develop propositions that predict in any social situation, which behaviors will be defined as illegal, who mobilizes the law, and who is likely to receive favorable outcomes from the invocation of law. These predictions are a function of the 'social structure' of cases, including their social inequality, social intimacy, cultural differentiation, organizational capacities, and link to extralegal normative orders. Unlike the transformations approach, Black explicitly eschews the subjective agency of individuals, instead treating legal mobilization as a purely behavioral dynamic. Moreover, he envisions law as a quantitative variable operationalized by the behavior of state officials such that, for example, "an arrest…is more law than if no such action occurs" (Black, 1980: 210). The theory is intended to apply to the mobilization of law in all historical periods and societies. Researchers have extended the theory in multiple ways to a variety of social and historical contexts.

Collective Legal Mobilization

Although the boundaries between individual-level and collective legal mobilization are sometimes fuzzy, this distinction, both theoretically and empirically, is useful. This boundary helps scholars more fully examine the assumptions and contradictory consequences of law as it relates to social change. Research on collective legal mobilization emerged out of the US civil rights era, particularly examining whether rights mobilized and legal victories gained through litigation strategies (e.g., the overturning of the 'separate but equal' doctrine), produced or can produce meaningful social change. Scheingold (1974) termed the fervent belief in the power of rights to produce social change, the 'myth of rights,' in order to underscore how foundational this belief is in the US, especially among disadvantaged social groups, despite equivocal evidence about the power of rights to produce change or even be mobilized. The myth of rights thus produces a politics of rights, becoming a valuable resource for social movements in the pursuit of social change.

Building in part off Scheingold (1974), Handler (1978) explicitly focuses on the tangible benefits instrumentally produced by movement-spurred litigation, identifying what he called *direct* and *indirect* effects. Movement litigation accomplishes direct effects when there is a definitive legal ruling that alters the law on the books in ways favorable to reform supporters and when those changes lead to sustained enforcement of the law in action. Movement litigation may have a limited capacity to achieve meaningful social change because such efforts do not consider the organizational and social contexts where such innovations would be implemented. Even if a movement succeeds in changing the laws on the books, for instance, it may fall short of changing the law in action due to a lack of administrative capacity, scarce resources, and/or countermobilization. Handler (1978) thus draws on the resource mobilization perspective in social movement theory (McCarthy and Zald, 1977) by calling attention to the importance of organizational resources in facilitating collective legal mobilization aimed at social reform. By contrast, the indirect effects of movement-spurred litigation leverage bargaining power for nonlitigation strategies, such as movement solidarity, publicity, and fundraising. Here again, resources play a key role but in a broader sense, as they fuel political strategy rather than only administrative enforcement. The indirect effects of collective legal mobilization can lead to imaginative extralegal tactics that differ from the narrower interests of the legal profession in changing the laws on the books (Handler, 1978: 222).

Conceptual schemes, sometimes explicitly or implicitly echoing Handler's (1978) instrumental perspective, continue to inform thinking about the consequences of collective legal mobilization in the United States. Rosenberg (1991), for example, argues that scholars regard courts as either 'constrained' or 'dynamic' in evaluating the direct effects of collective litigation to change national-level social practices across multiple bureaucratic and institutional settings. In the 'constrained court' view, various aspects of the American legal and political systems constrain courts from fulfilling the hopes believers place in them: boundedness to constitutional rights; a lack of judicial autonomy from other branches of government; and a paucity of 'tools' to implement law. Believers in the 'dynamic court' perspective claim that adherents to the 'constrained court' perspective 'underestimate' court effectiveness by ignoring how courts act as catalysts for social change as they 'dramatize' social issues (Rosenberg, 1991: 25). Rosenberg finds that the US Supreme Court has not directly instigated a single social change or indirectly motivated change through consciousness raising or other symbolic processes. Although the direct and indirect effects of movement litigation are difficult to measure owing to problems of appropriate comparison, operationalization, and temporality, in the end, Rosenberg (1991: 35) argues that only under conditions of extralegal incentives and costs (e.g., by the market) or when legal reforms offer plausible rationales (i.e., 'cover') for those 'willing to act' can collective litigation produce direct, significant social change.

In contrast to Handler (1978) and Rosenberg's (1991) instrumental approaches, constitutive approaches to collective legal mobilization view law not as an exogenous tool for social change or consciousness raising but rather as a cultural system of communicative practice and knowledge embedded

in society. The most well-known proponent of this approach is McCann (2004), who views law as complex, mixed, variable, and contingent upon social and historical context. From a constitutive vantage point, attention is devoted to how legal discourses and symbols intersect with and are expressive of broader ideological formations. Law becomes a way to structure social relations and categories, formulate moral visions for social life, and negotiate conflict. Constitutive approaches tap into the full array of social movement theory identifying how resources, political opportunities, and framing relate to collective legal mobilization (McAdam et al., 1996). Power figures prominently in these dynamics as institutional authorities can control or repress meanings, enforce boundaries, and use selective violence against those who violate official readings of the law.

McCann's (1994) study of the pay equity movement in American workplaces illustrates the constitutive approach. In his research, he found that rights are continually being negotiated, constructed, altered, and resisted depending upon where a movement is in its 'stage' of legal mobilization: movement building and emergence; identifying compelling formal changes in official policy; policy implementation; or informing subsequent struggles. Although collective legal mobilization can importantly raise consciousness in the initial stages of a movement, it can also pave the way for subsequent interpretations of law that can facilitate reform in unanticipated ways even in the wake of failed reform efforts. Beyond pay equity reform, the failed attempts to pass the Equal Rights Amendment (ERA) in the United States illustrate these processes. The ERA would have guaranteed equal rights for women. Although never passed as a piece of legislation, mobilization around it helped forge new constitutional interpretations that led to eventual recognition of equal protection doctrine prohibiting discrimination based upon sex (Siegal, 2006).

The recent US Supreme Court decision in the *Dukes v. Wal-Mart* (2011) gender discrimination case illustrates many of the complexities relevant to collective legal mobilization. The Court ruled that this class action case could not go forward on procedural grounds, specifically that "female employees would not be able to establish discrimination across all of Wal-Mart's 3400 stores." The Court also placed "great weight on the fact that 'Wal-Mart's announced policy forbids sex discrimination'" (Edelman et al., 2011: 889). In this sense, the Court deferred to the efficacy of organizational policies despite considerable evidence (again, in dispute) that those policies did not produce their ostensibly intended effects in Wal-Mart stores (Edelman et al., 2011). This case underscores how organizational power can thwart the capacity of law to effect social change – something that Handler (1978) long ago identified. Beyond Handler (1978), however, contemporary scholars point to the power of organizations to influence not only the implementation of legal reforms once they are decided, but also legal decision making itself. Moreover, *Dukes v. Wal-Mart* may carry constitutive effects as it symbolizes for many who face discrimination, the futility of participating in collective legal mobilization aimed at righting social injustice and will almost certainly influence subsequent legal decision making in this and related areas of law. Thus, the constitutive effects of law may cut both ways, paving the way for change and constraining reform.

Cutting-Edge Research on Legal Mobilization

Multiple generations of researchers have shed light on a number of features of individual-level and collective legal mobilization. At the individual level, there is a broad conceptual and empirical base with which to understand how people come to define problems as legal or rights violations, the conditions under which people attempt to invoke law or other normative mechanisms to pursue their rights, how disputing evolves, and what explains its outcomes. Researchers concerned with collective legal mobilization have focused on the group processes through which law can lead to social change, tracing back this relationship to foundational – albeit contradictory – ways of conceiving law, rights, and change. Sociolegal frameworks drawing on social movement theory provide great insight into the mechanisms of and constraints on law-related social change as well as different ways of assessing outcomes.

Despite these accomplishments, previous legal mobilization research is constrained in multiple ways. First, there has been little attempt to link theory and research on legal mobilization across the individual and collective levels of analysis. Second, previous research tends to focus on individual- and movement-initiated (reactive) legal mobilization in liberal democracies and in single societies. Less is known about the (proactive) repression of legal mobilization in liberal democracies, legal mobilization in authoritarian regimes, or how law is constructed and/or invoked transnationally. Finally, research on legal mobilization, particularly at the collective level, is marked by an emphasis on studies of single contexts or movements thus constraining the assessment of broader patterns. Cutting-edge research on legal mobilization addresses each of these constraints in turn.

Earl (2009) uses the 'crosscutting' concept of 'trouble' to argue that despite different conceptual languages there is significant overlap in the concerns of researchers studying individual-level and collective legal mobilization. At the most abstract level, legal mobilization researchers are interested in how people come to define trouble, assign responsibility for it, whether they turn to law to do something about it, and the outcomes of these efforts. These dynamics are captured at the individual level in Felstiner et al.'s (1980–1981) classic trilogy of 'naming, blaming, and claiming' and at the collective level in the framing processes through which social movement actors make sense of situations that can 'mobilize potential adherents and constituents' (Snow and Benford, 1988: 198). The meanings of law are often constructed in these processes and supply important frames that help diagnose what a problem is, suggest particular strategies and remedies, and signal legitimacy and compelling moral identities. Multilevel analysis might lead to understanding the conditions under which individual mobilization becomes collective and vice versa (i.e., the problem of demobilization) and the relationship of these processes to features of the legal system relevant to a particular normative domain (e.g., ambiguous rights and procedures).

The proactive mobilization of law leads back to the distinction between 'repressive' and 'responsive' law offered by Nonet and Selznick (1978). The former exists when a legal system gives 'short shrift to the interests of the governed' (Nonet and Selznick, 1978: 29). Responsive law, most often recognized in the ideals of liberal democracy, exists when

a legal system selectively adapts to the social needs of a society within the boundaries of enlightened civility and reason (1978: 74–113). In this sense, all law is repressive at least part of the time and most systems are responsive at some points in their lifetimes. When law only protects those interests that are deeply intertwined with existing power and privilege, it is a repressive system. With respect to the repression of legal mobilization in liberal democracies, some researchers have analyzed the policing of street protests, finding that the types of strategies used by police to control protest events vary considerably and that different types of strategies have chilling effects on subsequent protests and other forms of policing have little or facilitative effects (Earl and Soule, 2010). Legal mobilization also has been investigated in the context of prisons, often characterized as the most repressive of liberal-democratic institutions. In a counterintuitive study, Calavita and Jenness (2013) find almost three-quarters of randomly sampled, California prison inmates had filed internal grievances contesting poor medical care, bad food, lack of physical safety, unfair disciplinary action, unpredictable transfers, or theft. This finding stands in contrast to long-standing empirical findings (discussed above) that vulnerable, impoverished, and stigmatized populations often face considerable barriers to mobilizing the law. Calavita and Jenness (2013: 52) argue that the extensive quasi-legal mobilization by prisoners "must be seen within [the] context of prison…as a conspicuously *legal* [total institution] where explicit rules govern every aspect of behavior [emphasis in the original]." Inmates' high rates of mobilization thus reflect the law-drenched prison context in which they are held and the broader responsive law context of a liberal democracy. In these contexts, inmates mobilize the prison's rules and procedures against itself, opening up possible sites for challenge and change.

A venerable part of the tradition of examining legal mobilization outside liberal democracies explores the overturning of repressive legislative codes and the establishment of constitutional courts in the aftermath of the collapse of fascist, communist, and apartheid regimes. The establishment of human rights associated with transnational forums, such as the United Nations Human Rights Council, the International Criminal Court, or the European Convention on Human Rights, has opened a wave of legal mobilization that sometimes challenges but is typically dependent upon state-based codes of law (Shapiro and Stone Sweet, 2002).

As researchers have begun to study legal mobilization by citizens within existing authoritarian regimes, they have sometimes found such regimes to be surprisingly responsive to particular issues as long as invoking the law to solve social problems does not threaten the overall legitimacy of the central state. For example, Michelson's (2007) survey-based research in China suggests that members of households in the least economically developed areas of China turn to the centralized official justice system to solve economic, neighborhood, or personal injury grievances at greater rates than more economically developed areas. But family ties moderate this relationship – those households with stronger political connections to governmental officials are more likely to use the legal system. Thus, social class and social ties matter as one climbs the 'dispute pagoda' in China just as they matter as one climbs the 'dispute pyramid' in liberal democracies, but in different ways. At the same time, the Chinese state can be quite 'ambivalent' about the desirability of litigation, sending mixed messages to citizens and other interested parties, for example, in the case of the emerging field of environmental litigation. As Stern (2013: 4) observes, a 'medley' of actions and policies by the Chinese government simultaneously signals promotion of the 'rule of law' *yet* 'control' of courts, and economic growth *and* environmental protection even in the face of considerable environmental degradation. In other authoritarian contexts, the problematic character of 'rights' via collective mobilization becomes especially salient. Chua's (2012) work on collective mobilization by Lesbian, Gay, Bisexual, and Transgender (LGBT) activists in Singapore points to the alternative ways that activists mobilize law through 'pragmatic resistance' that avoids confrontational tactics and rights litigation, thus skirting repression by the state.

Aside from work on legal mobilization in authoritarian regimes, cutting-edge research also has studied legal mobilization in transnational contexts. In some ways, this work harkens back to anthropological studies of law that sought to understand responses to normative breaches in societies across a broad span of human cultures (e.g., Nader and Todd, 1978; Roberts, 1979). Newer traditions of research of this type have emerged in three sometimes overlapping, sometimes distinct strains. The first seeks to understand the construction of transnational legal orders by American and European lawyers and other elites, such as the field of commercial arbitration that governs much of the disputing among global commercial interests, especially large corporations (Dezalay and Garth, 1996). To borrow from Galanter (1974), such legal orders only serve repeat players and have zealously guarded and privileged boundaries that prevent all but the most powerful from entering. The second approach has focused on the growth of legal orders from below that challenges elite and neoliberal legal orders via the mobilization of national courts and transnational advocacy networks (Sousa Santos and Rodríguez-Garavito, 2005). These efforts slip back and forth between the legitimacy of law and the sometimes ambiguous, popular legitimacies and illegitimacies of extralegal mobilization. The third strain seeks to understand the interplay of legal orders proffered by global governance institutions and their reception in local contexts. Merry (2005), for example, argues in the context of human rights and the prevention of gender violence that for human rights regimes to be effective at the local level, they must be framed in ways that articulate with local conditions and state power. Lack of attention to the local contexts in which human rights or other forms of global legality are introduced invites disaster, such as in the Sudan where human rights not only failed to empower the 'war-ravaged poor' but also created the conditions for further social conflict and strife (Massoud, 2013).

As sociolegal scholars come to know more about the dynamics and consequences of legal mobilization, it becomes imperative that contemporary qualitative studies be supplemented with analyses of broader patterns. The national random survey that formed the basis for CLRP, now more than 30 years old, provides one such model for the study of individual-legal mobilization, which has inspired smaller-scale surveys in a number of institutional contexts and countries (e.g., Michelson, 2007; Morrill et al., 2010). Other projects,

such as the American Bar Foundation's Civil Justice Infrastructure Mapping Project, have begun painting a 'holistic portrait' of the access services available to deliver civil legal assistance, especially for low-income people (Sandefur and Smyth, 2011). Yet, there has not been a national-level survey of legal mobilization in the US that brings together both the legal mobilization and the services sides of the puzzle. Researchers have also begun to move beyond single cases or movements to compare how and why collective mobilization – both legal and extralegal – emerges in local communities and how the social, legal, and political conditions in those communities influence its outcomes (McAdam and Boudet, 2012). To continue the fruitful exploration of transnational fields of legality, multimethod approaches that can negotiate multiple levels of analysis also will be necessary. All these efforts, whether qualitative or quantitative, need to be informed importantly by engagement with the historical context in which legal mobilization unfolds; for it is only through careful attention to process, pattern, and context that we will come to know the full range of possibilities and constraints of legal mobilization.

Abstract

Although early sociologists studied law as part of industrialization and modernization, a distinct subfield emerged after the mid-twentieth century. This article focuses on two key bodies of research in the sociology of law: (1) studies of the formal institutions of law and (2) studies of the circulation, reception, and consumption of law, broadly conceived, beyond formal institutions of law. Using the shorthand phrases 'law within the courts' and 'law beyond the courts', this article summarizes key questions and findings of this work, describes its influence on later studies of law and globalization, and assesses its value added for sociolegal studies.

Introduction

Although the implicit and explicit study of law can be found in the writings of many early sociologists, the demarcation of the sociology of law as a distinct subfield within sociology began largely after the mid-twentieth century. The Research Committee on the Sociology of Law of the International Sociological Association, created in 1962, and the Law and Society Association, founded in 1964, were vitally important in bringing together social scientists conducting research on law. Yet the gradual nature of field development is signaled by the fact the American Sociological Association Section on the Sociology of Law was formed only in 1992 (the Section on Crime, Law, and Deviance had been in existence for some time).

As seems to have occurred in other areas of sociology, the coalescing of this new subfield began with a focus on the core institutions and the main groups of people engaged with those institutions. Just as sociologists of medicine initially studied hospitals, doctors' offices, medical schools, doctors, nurses, and patients and the sociologists of science initially studied laboratories, scientists, and technicians, so the sociologists of law looked first at courts (at multiple levels), juries, judges, lawyers, paralegals, and clients. And as occurred in other maturing fields, sociologists gradually began to look beyond these core institutions, core actors, and core activities, thinking more broadly about how law and legal actors function outside courts and law offices. This article focuses especially on these two key bodies of research in the sociology of law: (1) studies of the formal institutions of law, conducted especially from the mid-1960s through the early 1980s (but continuing to the present) and (2) studies of the circulation, reception, and consumption of law, broadly conceived, beyond these formal institutional settings, conducted mainly since the early 1980s. Referring to these two bodies of research with the shorthand phrases 'law within the courts' and 'law beyond the courts', this article summarizes the key questions and findings of this work in Sections Law 'Within the Courts': Research on Formal Law, Legal Institutions, and Legal Actors and Law 'Beyond the Courts': Research on the Circulation, Reception, and Consumption of Law. The Section Globalization, Governance, and Transnational Legal Transfers describes investigations of the relationship between law and globalization, particularly in the late twentieth century. The Section Conclusions: Value Added by the Sociology of Law assesses the value added from research on the sociology of law.

Law 'Within the Courts': Research on Formal Law, Legal Institutions, and Legal Actors

The early beginnings of the sociology of law can be traced to the brilliant and still valuable work of Émile Durkheim, Max Weber, and Karl Marx. Primarily concerned with such issues as the growth of capitalism, the division of labor, or the exploitation of workers, these early sociologists were interested in law as one of the constellation of forces at work in industrialization and modernization. Although he shared these concerns with what law contributed to the organization of society, Talcott Parsons (1954) was also one of the first scholars to distinguish professions from other kinds of work and to emphasize the unique orientations and contributions of professionals such as lawyers and judges. This emphasis on legal actors themselves and the nature of their work helped propel the sociology of law into its next phase.

Animating the research on the sociology of law, then, were two sets of questions coming, on the one hand, from the legal academy and, on the other, from sociology. From the legal academy came questions about the gap between 'law on the books' and 'law in action', a discrepancy first noted by the legal realists of the early twentieth century (Pound, 1910). From sociology came questions about the organization of legal work, the careers of lawyers, and the capacity of law to redress injustice and mitigate inequality. Inspired by sociologists' questions about professions and legal scholars' questions about how law actually functions, sociologists – now beginning to identify themselves explicitly as sociologists of law – focused initially on legal sites, legal actors, and legal work. Over time, in a loose professional division of labor, some of these research areas came to be dominated by scholars from other fields. Jury studies and studies of procedural justice, for instance, have mostly been carried out by social psychologists; studies of court decisions

and law making have mostly been conducted by political scientists. Sociologists have continued to dominate, though, in studies of law firms, the legal profession, and the relationship between law and social inequality.

From a sociological perspective, the existence of the gap between law on the books and the practice of law is not particularly surprising. People sometimes prefer to do things informally rather than relying on formal legal tools such as contracts (Macaulay, 1963), and the law often is not implemented exactly as it was written. Notably, these findings could be anticipated in a discipline that has emphasized the discrepancies between formal organizations and the less formal workings of those same entities.

But although sociologists had examined the gap between plans and action and between formal and informal processes in a wide variety of settings, research on the gap in law has nevertheless been significant. Because law often works by 'double institutionalizing' (Bohanan, 1965) existing rules, laws often are supported and enforced by more than one institutional system; these extra resources might be expected to decrease the gap. Because law is often billed as the last hope for the weak and vulnerable, gaps may be especially consequential. Yet, at best, law seems only marginally better at narrowing the gap between prescription and implementation. But beyond demonstrating the universality of the gap, scholars have also documented and described variations in the nature of the gap (Gould and Barclay, 2012). In core legal institutions such as the civil and criminal justice systems, scholars have demonstrated that justice works differently for different kinds of people (Feeley, 1979; Provine, 2011). In essence, these studies join together observations about the workings of organizations and work groups with observations about social inequality: formal statements of rules are not good descriptions of how action unfolds, but as rules are implemented, those who have abundant resources are more likely than those with scanty resources to be able to make the rules work to their advantage. These findings are brought together in such summary statements as Black's (1976) argument that more law is applied to people lower in the social hierarchy, in Galanter's (1974) piece on the 'haves' and 'have nots', and in Lempert and Sanders' (1986) discussion of legal endowments (which can be read as an attempt to account for variations in the nature and magnitude of the gap). Among other things, the sociological literature on the gap shows that although a gap may be a problem for some, it can be an opportunity for others (from the point of view of institutionalists in sociology, official forms can provide cover). Moreover, the gap is in part created by the sometimes valorized, sometimes disparaged use of discretion, perhaps especially in the government agencies and regulatory bodies that translate and implement law (Lipsky, 1980).

In thinking about the relationship between inequality and law, sociologists of law have also looked closely at the configuration of law firms and at the careers of lawyers and judges. Parsons included lawyers among the professionals who were differentiated from other workers both by the importance of their contributions to the smooth functioning of society and by the norms that guided their work. The expectation was that they could be counted on to pursue the interests of their clients in a disinterested way and that external regulation could be relatively light because professionals would monitor their own and their colleagues' work, which in any case could not so easily be judged by others who lacked their training and expertise. Over the years, sociological research suggested that professionals, including lawyers, were not quite so disinterested as Parsons believed. A few indicators make the point: legal education is expensive and not easily accessible to any but an elite and although many law students enter law school with the intention of doing public interest law, far fewer have this aspiration by the time they graduate (Granfield, 1992; Schleef, 2005); minorities and women are less likely to be represented in the fraternity of lawyers, and when they do enter the profession, tend to have careers that are systematically different than those of their nonminority, male colleagues (Epstein, 1981; Kay and Gorman, 2008); legal services are costly and more available to the rich than the poor, reproducing and exacerbating existing inequalities (Sandefur, 2008); lawyers, like other professionals, prefer to work on esoteric problems (such as those raised in corporate or constitutional law) rather than mundane ones (such as those raised in family law or probate law (Sandefur, 2001)); lawyers who work on the problems of the rich and powerful or the problems of corporations are paid better than those who attend to individuals, especially poor ones (Sandefur, 2001; Heinz et al., 2005). If anything, the location of legal work in firms magnifies these differences. As research on law firms shows, legal work tends to be split into 'hemispheres' with one group of practitioners focused on individual clients and the other focused on organizations (Heinz and Laumann, 1982; Heinz et al., 2005).

Law 'Beyond the Courts': Research on the Circulation, Reception, and Consumption of Law

Beginning roughly in the 1980s, the sociology of law moved 'beyond the courts'. Where earlier work examined the practice of law within formal legal institutions and examined the role of lawyers and judges in the interpretation, application, and enforcement of formal law, later work took as its starting point understandings or contests over law as they emerge outside of formal legal institutions. Rather than accepting the internalist demarcations of the boundary between what counts as formal law and what does not, sociologists of law instead problematized the question of what comes to be understood as 'legal' and 'not legal'. They studied both the presence and absence of law in a variety of arenas to determine if, when, and how law did – and just as importantly, did not – appear in lay accounts of the disputes, grievances, and administrative transactions of daily life. Two developments stand out in this exceptionally rich vein of research on law 'beyond the courts'.

Lay Engagement, Legal Consciousness, and the Constitutive Perspective

In the spirit of the 'cultural turn' to the study of meanings and symbols that animated humanistic and social science scholarship in the 1980s, sociologists of law looked carefully at lay engagement with law (Silbey, 2005). They asked how lay understandings of law emerge and how legal institutions are able to retain their authority in the face of persistent gaps between legal doctrine and legal practice (Silbey and Bittner, 1982; Merry, 1985;

Ewick and Silbey, 1998; Nielsen, 2004). These studies of legal consciousness and the associated constitutive perspective emphasize the inseparability of the social and cultural in what comes to be understood as legal.

A central research question in this genre was how conflicts in everyday life may or may not come to be understood as legal disputes or as requiring legal intervention, encapsulated in the so-called dispute pyramid and associated 'naming, shaming, and blaming' rubric (Felstiner et al., 1980). Rather than treating law as 'black letter' law codified in formal legal doctrine and enforced by experts (lawyers) in formal legal institutions that exist at some remove from society, sociologists instead took a law *in* society approach to show that both legal and nonlegal actors create, interpret, and selectively use rules, regulations, and legal doctrine in particular historical, cultural, and political contexts. Taken from the vantage point of the everyday, what comes to be understood as within the purview of the law informs what law can (and cannot) do and, therefore, is a key factor mediating the observed gap between law on the books and law in action that animated scholarship on the workings of law in formal legal settings.

Interpretation, Implementation, and Enforcement: Institutionalization and Organizational Practices

As sociologists of law explored everyday uses of law, they also began to train attention on the mesolevel – the organizations, which are the central sites of adoption, adaptation, and resistance to new laws, rules, and regulations. Scholars have explored the role of law in regulating activity in a wide range of institutional spheres, including medicine (Heimer, 1999; Horowitz, 2012; Shapiro, 2012), science (Jasanoff, 1995; Silbey and Ewick, 2003), insurance (Heimer, 1985; Baker, 2010), and finance (Halliday and Carruthers, 2007), among others. The diffusion of law and legalistic modes of governance into these diverse settings have brought a good deal of extra compliance work, but have not often brought the leveling of the playing field or the decreases in injustice that Selznick and his colleagues (Selznick et al., 1969) might have anticipated.

This mesolevel research drew on neoinstitutionalists' research on the diffusion and institutionalization of new laws, regulations, and associated practices in professional fields and organizations. If enacted, do new laws and regulations achieve their intended effects? A key insight of neoinstitutional theorists is that the adoption of new policies or practices can be purely performative or ceremonial (Meyer and Rowan, 1977), a means to signal credibility, legitimacy, or superficial compliance with new regulations or norms. In fact, accepted professional norms or organizational practices can powerfully persist even as organizations seek to innovate, sometimes leading to 'institutional isomorphism' among a particular population of organizations with a shared purpose, function, or market (DiMaggio and Powell, 1983). This early research spurred the study of the decoupling of organizational policies from actual practices.

Of relevance to sociolegal inquiry is the cautionary message that there is no simple relationship between the adoption of new laws, policies, and regulations and changes in organizational practices. However, other studies have shown that initial symbolic adoption can later lead to instrumental effects, particularly if a profession or constituency develops to support and institutionalize a new policy or practice (Heimer, 1999; Dobbin, 2011). For example, even after the legal pressures for adoption of corporate affirmative action policies had waned, human resources personnel successfully made the case for a link between greater efficiency and greater workforce diversity (Dobbin, 2011). Organizational policies and practices also may influence common understandings of the problem the law was designed to address as well as the substance of the laws and regulations to which organizations are subject. For example, organizations in the United States anticipated employment discrimination lawsuits and preemptively created internal Equal Employment Opportunity Grievance Procedures. Because definitions of compliance were worked out in the back and forth between courts, regulatory agencies, and regulated organizations, these organizational policies ultimately served as a shield against corporate liability in court and effectively helped to constitute the nature and substantive content of laws designed to prevent and sanction discrimination in employment decisions (e.g., hiring and firing) and work conditions (e.g., sexual harassment) (Edelman et al., 1999, 2011). In effect, law is endogenous and organizations cocreate the meaning of the laws and regulations to which they are subject. If anything, organizations seem to have had the upper hand in this process of cocreation. Nelson and Bridges' (1999) painstaking study of organizations that were sued shows that courts all too often uncritically accepted employing organizations' market explanations for pay inequities, in effect legalizing gender-based wage inequality.

Seeking to explain legal change, scholars looked at the activities of the legal and nonlegal change agents who helped craft new laws, regulations, and organizational practices, both within and beyond courts. Institutional entrepreneurs created new organizational forms (DiMaggio, 1988); cultural entrepreneurs crafted new concepts to highlight existing problems (such as sexual harassment) and new rules and laws to reshape behavior (Saguy, 2003); and professionals functioned much like social movement activists by pushing for new organizational policy, structure, and practice within their areas of expertise (Davis et al., 2005). Because new organizational forms codify contested definitions of law and social problems, organizational settings offer sites in which scholars can learn how everyday decision making and interactions help produce higher-order social consequences, often but not always reproducing existing social inequalities.

Globalization, Governance, and Transnational Legal Transfers

More recently, sociologists of law have contributed to research on late twentieth-century processes of globalization. Of course, the global context has always shaped the research agenda of anthropologists of law and other sociolegal scholars studying legal pluralism, colonization, decolonization, and postcolonial legal reform. In contrast, sociologists of law became interested in global processes much later and have drawn on their disciplinary heritage to trace the exportation and transnational movement of legal professions, formal legal institutions, and legal regimes from the global North to the global South.

Sociologists of law have taken up studies of change in formal law, legal institutions, and the legal profession, both in comparative and global contexts. Actors, organizations, and professions make up transnational networks that facilitate the global diffusion of particular laws and legal regimes with their attendant legal and cultural norms. Similar to studies of the legal profession in studies of law 'within the courts' and change agents in studies of law 'beyond the courts', much work in this area initially focused on elite lawyers (Munger, 2012) who lead or challenge the adoption of new laws, regulations, or governance structures at the national level but who simultaneously influence and are influenced by developments at the transnational level (Dezalay and Garth, 1996, 2002, 2010). Later studies of domestic and transnational social movements have highlighted the role of nonelites and activists in legal and constitutional reform (Kay, 2011; Klug, 2000; Merry, 2006; Munger, 2008–09).

Legal sociologists have also carried their interest in understandings, uses, and impacts of law beyond courts and formal legal institutions into comparative and global research. Similar to studies of adoption and institutionalization of new rules within organizations based in the United Studies, studies of innovation and diffusion have animated scholarship on the globalization of law (Halliday and Osinsky, 2006) and public policy (Dobbin et al., 2007). Transnational diffusion inevitably involves resistance, adaptation, and innovation by domestic actors who often must do substantial work to make new laws, rules, norms, and technologies – often formulated in the global North – relevant in new environments – often in the global South (Klug, 2002; Merry, 2006; Heimer, 2013). For example, human rights activists 'vernacularize' purportedly universal norms, translating them into local discourses and using them to make more specific claims in their own countries (Merry, 2006). Such domestic actors exercise agency by resisting the imposition of foreign norms and simultaneously using these same norms strategically to further their own domestic agendas.

Just as sociologists of law demonstrated that legal and nonlegal processes enacted beyond the courts domestically often influenced processes enacted within national courts and other legal institutions, so scholars have documented similar feedback effects spanning national borders. In global bankruptcy regimes, for instance, Halliday and Carruthers (2007) find 'recursivity' at both national and transnational levels. Likewise, the 'hybridity' of new constitutions crafted after democratic transitions incorporate both domestic and international content and in turn create new exemplars for others to use (Klug, 2002).

Conclusions: Value Added by the Sociology of Law

As a subdiscipline, the sociology of law has fruitfully joined research on the central institutions of law with research that acknowledges the complexity of life outside these main sites of formal legal activity. But what special insights into sociolegal processes have come from these sociological studies? And, in turn, what new insights has the sociology of law brought to the discipline of sociology?

The sociology of law draws on sociology's longstanding study of complex organizations, professions, and social inequality to gain insight into what happens in courts, regulatory agencies, and law firms and the institutional spheres in which law is applied (e.g., hospitals, laboratories, insurance companies). Actors at work within these organizations, including lawyers, judges, and police, but also other nonlegal personnel (doctors, human resource personnel, administrators) charged with enforcing the law beyond the courts, variously cooperate, collaborate, resist, and adapt the law's requirements in ways that simultaneously apply, alter, and elaborate the law, thereby often influencing both the substantive content of formal law and the extent to which it achieves its intended effects. Clearly for law to do its work, it has to travel beyond the courts into other institutional settings. But when it arrives in those settings, it is deeply shaped by the day-to-day, practical constraints of organizations. Translating law into organizational routines fundamentally alters the meaning of law. Moreover, law in action is also deeply shaped by the fact that the professionals who do law-related work are not simply neutral instruments of the law, but are also people who care about compensation, prestige, challenging work, and the interests of their professions and their employers. And although law is sometimes billed as a tool to help the disadvantaged (and of course it is sometimes deployed that way), it often instead shores up inequalities. Actors with more resources or more experience using legal tools are more able to use law to their advantage. Examining law from sociological perspective thus gives us important insights about where gaps between law on books and law in action are especially prominent and why.

The sociology of law also informs core questions and concerns within the discipline of sociology. Whether training attention on the formal institutions of law (courts, police, law firms, regulatory agencies), or formal settings in which law is applied (hospitals, laboratories, corporations), work in this subfield has demonstrated that the importation of laws, rules, regulations, and legalistic ways of organizing social activity is deeply consequential. Clearly, law on the books differs from law in action with highly consequential implications for realizing justice and equity in society more broadly. Legal actors and nonlegal actors within and outside of formal legal institutions exercise discretion in the interpretation and application of formal law in a variety of domains; they thereby contribute to its uneven enforcement and participate in constructing the meaning and content of the law in practice. Individual lawyers, in aggregate, constitute a profession stratified based on differential prestige, training, occupation, and demographic characteristics much like any other profession, which in turn has implications for access to justice more broadly. Whether the diffusion of legalistic approaches has increased access to justice is debatable. What is clear, though, is that legalization has required organizations to add legally trained staff, create new positions and training programs for compliance workers, and establish new routines to track rules and demonstrate compliance (Heimer and Petty, 2010).

Taken together, work in this subfield suggests that formal institutions of law are sites in which broader inequalities can be challenged, but also reinforced, if not amplified. It also suggests that assessing the efficacy and impacts of new laws necessitates

looking outside the formal institutions of law to other institutional spheres that are central to the enforcement of legal mandates. Research in the sociology of law seeks to contextualize and explain the locally contingent and constructed nature of law, its meanings, and its enforcement. Based on insights derived through careful attention to practice and behavior both within and outside of the formal institutions of law, it demonstrates that there is no universal, neutral, or purely mechanical application of the law as it is written – thereby challenging popular ideas about how the law does or should work. In this way, close attention to law in practice reveals important gaps that fundamentally challenge some of the most foundational assumptions about the structure and application of law.

Extending the insights of the subfield to consider law in comparative and global contexts, sociologists of law continue to highlight the uneven distribution of legal resources and access to formal institutions of law, as well as the increasingly complex transfers that move law across both geographical and institutional boundaries, further complicating the insights developed largely in the context of the industrialized countries of North America and Western Europe. Unequal governance systems facilitate and condition the movement of laws, and norms move in tandem with resources from the global North to the global South (Silbey, 1997). Although South–South and South–North transfers do occur, they have less impact on governance and receive a good deal less attention. Like other 'globalized localisms' (Santos, 1995), law and legal norms have particular points of origin and serve the interests of particular power holders yet come to be described as global or universal once they diffuse transnationally. In this way, the unequal power relations that undergird many such transfers are obscured.

Many standardized tools and practices are described by their proponents as technically superior, neutral, and universal solutions. The claims on law's behalf are made especially strongly, suggesting that it is seen as the most universal of universal tools. Yet neutral, universal tools still have to be used to solve particular problems in particular contexts. It is in clarifying the importance of those details about differences among users, settings, and problems and how they are matched with the alleged universality of law that sociology of law makes its most important contribution.

Law: The Socio-Legal Perspective

Abstract

The sociolegal perspective on law portrays law as dynamically intertwined with society, politics, markets, science and technology, culture, and other social institutions. In this view, law is seen as a set of socially institutionalized norms of varying degrees of formality, ranging from statutes and judicial decisions at the formal end of the spectrum to socially institutionalized norms and cultural understandings that become embedded in everyday life at the informal end of the spectrum. Law is envisioned as deeply embedded in society rather than as autonomous in relation to the citizens and organizations that it is designed to regulate. The sociolegal perspective tends to emphasize three broad dimensions along which law matters to social life: regulatory, procedural, and constitutive.

Introduction

The sociolegal perspective is our portmanteau term for a set of diverse but overlapping views of legal phenomena and their settings. It originally evolved in reaction to what was perceived as an overly formalistic emphasis in law schools and legal analysis on law as a rational set of edicts emanating from the state, applied by the courts, and followed by citizens. As part of the 'Law and Society Movement' of the mid-1960s, sociolegal scholars offered a broader and more socially and empirically grounded understanding of law. The sociolegal perspective understands law as much broader than the statutes, judicial decisions, and administrative regulations that are the primary focus of law schools and practicing lawyers, and as dynamically intertwined with society, politics, markets, science and technology, culture, and other social institutions. Generally, law is viewed as a set of socially institutionalized norms of varying degrees of formality, ranging from statutes and judicial decisions at the formal end of the spectrum to socially institutionalized norms and cultural understandings that become embedded in everyday life at the informal end of the spectrum. Law is envisioned as deeply embedded in society rather than as autonomous in relation to the citizens and organizations that it is designed to regulate. Law varies substantially across social contexts, moreover. Not only do formal laws differ across nations and subunits of nations, but the understandings and implementations of law vary across contexts even when formal laws look similar.

The boundaries of the sociolegal perspective are fluid and evolving, varying somewhat across disciplinary orientations. Political scientists tend to emphasize rules in the public sphere, focusing on judicial decision making (Epstein and Knight, 1998; Segal and Spaeth, 2002), as well as voting (Burch, 2011; Erikson, 1995), street-level bureaucrats in public agencies (Lipsky, 1980; Maynard-Moody and Musheno, 2012), the politics of criminal justice (Feeley, 1992); constitutions, constitutionalism, and constitutional courts (Elkins et al., 2009; Klug, 2000; Moustafa, 2003); and 'soft law' (Abbott and Snidal, 2000; Bothe, 1980; Chinkin, 1989; Gruchalla-Wesierski, 1984; Seidl-Hohenveldern, 1999; Tammes, 1983). Sociologists tend to emphasize legal meaning making by citizens and the subtle influence of 'legal consciousness' in everyday life (Abrego, 2011; Albiston, 2005; Engel and Munger, 2003; Ewick and Silbey, 1998; Merry, 1990; Nielsen, 2000; Sarat, 1990), governance processes in private organizations and other nonstate entities (Edelman et al., 1993; Edelman and Suchman, 1997; Edelman et al., 1999; Nelson and Bridges, 1999; Stryker, 2000; Suchman and Cahill, 1996), dispute resolution and barriers to the mobilization of justice (Felstiner et al., 1980; Michelson, 2007; Miller and Sarat, 1980; Morrill et al., 2010; Nielsen and Nelson, 2005; Albiston et al., 2014), the operation of power and inequality in legal processes and institutions (Curran, 1977; Galanter, 1974; Mayhew and Reiss, 1969) and in the legal profession (Galanter and Palay, 1994; Handler, 1967; Heinz et al., 2005; Rosenberg et al., 1993), and the limits of law in remedying inequalities on the basis of class, race, gender, and other social dimensions (Albiston, 2010; Best et al., 2011; Crenshaw, 1991; Frohmann and Mertz, 1994; Gómez, 2000, 2010; Gorman, 2005; Haney-López, 2007; Obasogie, 2013; Pager, 2007; Suk, 2010). Psychologists often study jury behavior (Diamond and Casper, 1992; Diamond and Rose, 2005) and perceptions of justice and legal institutions (Tyler, 1990; Tyler and Huo, 2002), whereas economists tend to focus on the efficiency of various formal legal rules and rule-making regimes (Becker, 1968; Cooter and Rubinfeld, 1989; Donahue and Heckman, 1991; Posner, 1975). Increasingly, humanities scholars have entered into the sociolegal arena and have brought attention to the operation of law through texts, social constructions, and meaning making outside of the legal realm (Constable, 2009; Lokaneeta, 2010; Reichman, 2009).

These disciplinary orientations do not have hard boundaries, however, and sociolegal scholarship is characterized by interdisciplinary innovation and cross-disciplinary attention to various sociolegal problems. New sociolegal problems in the areas of human rights, social movements, environment, technology, reproduction, globalization, and the creation and breakdown of markets generate new areas of sociolegal scholarship. The sociolegal perspective is a 'big tent' involving multiple epistemologies, methodologies, and disciplinary perspectives, unified primarily by its understanding of law as a set of norms or institutionalized rules.

Because of the breadth and lack of uniformity within the sociolegal perspective, any effort to characterize it will necessarily be imperfect and incomplete. There is a tension between

emphasizing founding principles and evolving understandings and debates. Nonetheless, we think that the sociolegal perspective tends to emphasize three broad dimensions along which law matters to social life: regulatory, procedural, and constitutive (Edelman and Suchman, 1997). The regulatory dimension involves studies or theories of law as a set of formal rules, informal norms, and principles underlying legal policies that are either meant to shape or control social behavior. Studies of the legal impact, compliance and noncompliance, and the role of extralegal normative orders generally emphasize the regulatory dimension of law. The procedural dimension involves studies or theories of law as a set of tools, practices, resources, or strategies that may be mobilized for creating, challenging, and resolving claims, disputes, and rule ambiguities; for seeking strategic advantages vis-à-vis other parties; for seeking to rationalize transactions; and the like. Studies of contracting behavior, dispute resolution, cause lawyering in litigation, and social movement efforts to enact favorable legal rules generally emphasize the procedural dimension of law. Finally, the constitutive dimension of law involves analyses of law as a set of symbols and forms that evoke and replicate meanings and understandings. Constitutive analyses generally study the role of law in everyday life including the ways in which legal categories and concepts structure social behavior, the way in which people understand the law and invoke it in their daily routines, and ways in which people mobilize or resist law (Ewick and Silbey, 1998).

The regulatory, procedural, and constitutive dimensions of law are not mutually exclusive, and, in fact, most social behavior involves aspects of more than one of these dimensions. To some extent, the regulatory and procedural dimensions of law were the focus of earlier sociolegal studies, which often examined the impact of particular legal rules; the 'gap' between 'law on the books' (i.e., formal law) and 'law in action' (i.e., law in its social context), or discretion in the application of formal legal rules. The constitutive dimension is more common in more recent sociolegal scholarship, which tends to examine the cultural facets of law, to deemphasize formal legal institutions, and to emphasize the ways in which law shapes social thought and social behavior not through rules and sanctions but rather through meaning making. The turn toward constitutive studies has caused a rethinking of the regulatory and procedural facets of law, leading to more attention to social construction and legal consciousness within analyses of the regulatory impact of law or the procedural uses of law.

To complicate matters further, the regulatory, procedural, and constitutive dimensions of law are loosely correlated with both disciplines and methodologies. Economists, psychologists, most political scientists, and some sociologists tend to focus on the regulatory and procedural dimensions of law using more traditional and more quantitative methodologies (sometimes referred to as 'normal science'), whereas anthropologists, some sociologists, and some political scientists, as well as some humanities scholars, especially recently, are more attentive to the constitutive dimension of law and tend to use qualitative empirical methods such as ethnography and interviewing or alternative methodologies such as discourse or textual analysis. Legal scholarship has become more interdisciplinary over time, as reflected in the work of scholars in law schools. Furthermore, many sociolegal scholars work across disciplinary and methodological boundaries, allowing greater understanding of the ways in which the regulatory, procedural, and constitutive facets of law are dynamically intertwined.

Substantive foci are also loosely correlated with these three dimensions. For example, studies of judicial behavior are primarily conducted by political scientists using quantitative methodological techniques. These studies examine the regulatory dimension of law to the extent that they focus on the substantive doctrine that judges devise or the impact of judicial attitudes or politics on judicial decisions, and they examine the procedural dimension of law to the extent that they focus on the impact of judges' strategic efforts to avoid being overturned or to mobilize legitimacy for the court. Studies of law and social movements are mostly conducted by sociologists, although some political scientists also work in this area, and tend to use qualitative methods. Many of these studies focus on the procedural dimension of law, that is, how movement activists use litigation and other strategies to achieve their substantive goals. Studies of legal consciousness are mostly conducted by sociologists and anthropologists, use almost exclusively qualitative methods, and highlight the constitutive dimensions of law.

Given the overlapping nature of the three dimensions we have outlined (both in terms of disciplinary and methodological orientation and substantive topics) and the chronological development of the field, there are many ways that the basic arguments of the sociolegal perspective could be presented. In the remainder of this article, we organize our discussion of the sociolegal conception of law by broad substantive themes in sociolegal analysis. Within our discussion of those themes, we discuss how, and the extent to which, scholarship on those topics emphasizes the regulatory, procedural, and constitutive aspects of law. We are also attentive to changes over time in the foci of sociolegal studies.

Early Themes

The themes we discuss in this section became prominent early in the articulation of the sociolegal perspective on law, that is, in the mid-1960s and 1970s, although these themes are far from absent in more recent analyses. These early analyses were primarily oriented toward the regulatory and procedural aspects of law, but many have been revisited in recent years with a more constitutive flare.

The Gap

Early law and society research focused on what is seen as a gap between 'law on the books' and 'law in action.' 'Law on the books' refers not simply to laws codified in statute books or judicial decisions, but more generally to the formal legal system and to assumptions about how that system operates or ought to operate. In contrast, 'law in action' refers to law in its social context, which is often determined through empirical study. Gap studies focus on both the regulatory and procedural facets of law. Attention to regulatory processes often takes the form of legal impact studies that examine whether law that seeks to regulate social behavior in fact produces compliance by organizations (Hawkins, 1984; Stone, 1975; Vaughan,

1985) or individuals (Tyler, 1990), and how law in fact operates in society given power, discretion, social roles, deviance, and other social realities (Albiston, 1999; Friedman, 1975; Galanter, 1974; Macaulay, 1963). Studies that emphasize the procedural dimension of law tend to identify how laws are used by various parties in ways that deviate from the formal model. For example, Macaulay's seminal article on contract law showed that businesses often preferred informal agreements to formal contracts and rarely invoked formal contractual remedies when contracts were breached (Macaulay, 1963). Merry's (1979) article on strategies of dispute management in an urban neighborhood shows how people file complaints in criminal courts as a way of harassing neighbors with whom they are having a dispute. Engel's (1984) work on personal injury dispute resolution shows how social norms affect the likelihood of using courts to resolve disputes of various types. He shows that in a small cohesive community, people are less likely to make use of personal injury litigation because it violates norms about personal responsibility. Among newcomers to the community, who were less likely to share these cultural ideas, personal injury litigation was more likely.

A good deal of law and society research examines the gap in the contexts of judges, courts, legislators, administrative agencies, lawyers, and police (*see*, e.g., Courts and Adjudication; Rights: Legal Aspects; Race and the Law; Civil Rights; Injustice: Legal Aspects). In general, the sociolegal perspective emphasizes the way in which these various actors and institutions adjust to their social contexts. Instead of a portrait in which judges are impartial and passive, legislators act in the public interest, laws are clear, administrative agencies enforce the law, courts and judges stand as impartial interpreters of law, lawyers act as adversarial advocates, police exercise no discretion, and people respond rationally and promptly to all violations of law, we see a world in which judges are influenced by their political backgrounds, attitudes, and strategic efforts to succeed at reelection and avoid being overturned by higher courts (Epstein and Knight, 2000; Segal and Spaeth, 2002); courts become policy makers (Feeley and Rubin, 1999); legislators make deals (Buchanan and Tullock, 1965); administrative agencies soften the formal law, mediate disputes, engage in 'soft enforcement' like education or negotiation, and are sometimes influenced by those they are charged with regulating (Gunningham, 1987; Hawkins, 1984; Scholz, 1991); and police make critical decisions about what constitutes crime and how people are charged (Muir, 1979). The focus on the gap has also led to inquiries into the conditions under which law can bring about social change (McCann, 1994; Rosenberg, 1991), the circumstances under which people obey law (Tyler, 1990), and the role of law in social control.

Although the idea of the gap has motivated some important inquiries into the workings of law in society, late-twentieth-century scholarship found the idea of the gap to be flawed theoretically. Abel (1973) published a strong critique of the idea that the gap is problematic, suggesting that there is no reason to think that legal rules and legal behavior would be consistent and that the preoccupation of social scientists with the gap distracts from the construction of a social theory of law. Feeley (1976) similarly argued that the characterization of the gap depends on an overly narrow conception of the formal law and inability to identify or measure the goals of that law. Because formal law is often quite ambiguous, in part because its creators had diverse interests and objectives, it is misleading to characterize the actual operation of law as a deviation from the clear goals of formal laws. Rather, law can only be understood as embedded in its social context, where it is both the product and the source of social practices.

Bargaining and Negotiation as Key Features of the Legal Order

Emphasizing the procedural facet of law, one of the early 'discoveries' of law and society research is the pervasiveness and centrality of bargaining throughout the legal world. Processes of authoritative decision making turn out in fact to revolve around negotiation. Ostensibly adjudicative processes become negotiative ones; decision makers clothed with arbitral powers are transformed into mediators. The negotiated outcome in the shadow of the law turns out to be the master pattern of disputing in American courts and administrative agencies.

Bargaining often takes place in the 'shadow of the law' (Mnookin and Kornhauser, 1979). The rules of formal law confer on the parties what Mnookin and Kornhauser call a 'bargaining endowment,' that is, a set of 'counters' to be used in bargaining between disputants (Ross, 1970). The bargaining endowment that the formal law bestows on parties derives not only from the substantive entitlements conferred by the legal rules but also from the adjectival rules that enable those entitlements to be vindicated. But rules are only one source of the endowment conferred by the legal process: The delay, cost, and uncertainty of eliciting a favorable determination also confer bargaining counters on the disputants. Delay, cost, and uncertainty may themselves be the product of rules, but they also result from such nonrule factors as the number, distribution, fees, and work patterns of courts and lawyers. The meaning of the endowment bestowed by the law is not fixed and invariable, but depends on the relative characteristics of the disputants: their preferences, negotiating skill, aversion to risk, ability to bear costs and delays, to respond to deadlines and emergencies, and so forth. A different mix of disputant capabilities may make a given endowment take on a very different significance.

Knowledge about the legal system is often incomplete or inaccurate, however, so that, social, business, and professional norms have a greater impact on how parties bargain than do their putative legal bargaining positions (Edelman et al., 1993; Ellickson, 1991; Galanter, 1986). Parties may be influenced less by what would happen in court than by how their neighbors or business partners or coworkers think they ought to behave. The preservation of relationships often trumps the assertion of legal entitlements. As a result, social reform laws – especially to the extent that they depend on victims to mobilize their rights – infrequently succeed in effecting major social change (*see* Law as an Instrument of Social Change). Recent attention to the procedural facet of law moves beyond the notions of bargaining and discretion to frame the actions of legal actors more in terms of power and moral agency than in terms of discretion (Maynard-Moody and Musheno, 2012).

The Distributive Tilt of the Legal Order

Although modern adjudication is infused with ideals of equality before the law, and the isolation of the dispute from

the identity, connections, and resources of the parties, the sociolegal perspective on law emphasizes the myriad ways in which these ideals are imperfectly realized when law is considered in social context. Early studies focused on the role of class in limiting access to justice (Carlin and Howard, 1965; Galanter, 1974; Handler et al., 1978).

Legal rights are not self-mobilizing and the process of mobilization is a key site in which social disadvantage rears its head. To realize the benefits of social reform legislation such as civil rights law or equal pay legislation, those whose rights are violated must mobilize the law. The sociolegal perspective emphasizes the extent to which those who have less social clout are also less likely to 'name' legal wrongs, to 'blame' a legally responsible party, and to 'claim' in a way that may lead to legal redress (Bumiller, 1987, 1988; Felstiner et al., 1980; Marshall, 2005a).

Those possessing wealth, power, and other resources can hire better lawyers, invest in marshaling proofs and arguments, use delay to their advantage, and adopt strategies that deflect unfavorable rules and reap the full advantage of law (Heinz et al., 2005; *see* Injustice: Legal Aspects; Equality and Inequality: Legal Aspects). The advantages of stronger parties who are recurrent users of the legal system are even more pronounced in nonjudicial forums such as legislatures and administrative agencies. So legal regimes that accord a central place to equality norms may at the same time enable "the 'haves' [to] come out ahead" (Albiston, 1999; Edelman and Suchman, 1999; Galanter, 1974; Hagan, 1990).

In response to this paradox, legal systems have incorporated various devices to overcome the disparity in legal resources (*see* Justice, Access to; Class Actions, Legal; Public Interest Law: The United States and Beyond). The achievements and deficiencies of these devices have been a focus of law and society research. Although the presence of lawyers tempers the disparities in legal resources, it does not overcome them, for legal services are typically purchased in markets where those with superior resources can attract more proficient practitioners. Apart from differences in quality and quantity, legal representation is infected with agency problems. Lawyers have goals and needs that do not align perfectly with those of their clients. It is not simply that financial incentives may induce lawyers to do too much or too little, but that even the lawyer who eschews financial gain may be deflected by appetite for fame, honor, or 'interesting' work. For example, the low monetary stakes and repetitiveness of the legal needs of the poor run against the powerful pull of craft satisfactions and the aspiration to heroic distinction.

Although early studies of the distributive tilt of law focused on the ways in which legal rules and procedures benefited the 'haves,' thus emphasizing the regulatory and procedural dimensions of law, more recent studies incorporate the constitutive perspective by focusing on ways in which cultural assumptions about race, gender, disability, national origin, and other dimensions of social stratification are reified and often exacerbated by the legal order (Albiston, 2010; Best et al., 2011; Engel, 1991; Gómez, 2012; Marshall, 2005a; Obasogie, 2013). Many of these studies emphasize the ways in which law helps to construct notions of racial or gender differences or the ways in which law tends to disregard social processes that offer advantages to whites and males. For example, the notion of 'intersectionality' calls attention to how antidiscrimination law presumes that discrimination occurs along only one dimension (e.g., race or sex or age), substantially disadvantaging plaintiffs who suffer multiple disadvantages such as race *and* age. (Best et al., 2011; Crenshaw, 1991). These works call attention to the meaning-making dimensions of law and how they interact with more structural forms of disadvantage.

Multiple Sites of Governance

Sociolegal analyses of the regulatory facet of law emphasize that the state is only one source of law and legal norms. In most modern societies, the law presents itself as unitary, but nonetheless consists of multiple systems of regulation that coexist and intertwine (*see* Legal Pluralism). Religious bodies, universities, private firms, trade groups, and associations of all kinds devise and broadcast norms, regulate their affairs, and impose sanctions – often by means of proceedings that to varying extents mimic, if imperfectly, those of state law. Some legal systems openly yoke together several bodies of law from different origins. For example, some ancient and modern societies have had a system of 'personal law' in which the incidence of particular rules depends on the religious or tribal identity of the parties. Many legal systems formally recognize alternative sets of rules. Hart (1961) pointed out that in addition to primary rules, the law contains various sets of secondary rules about the recognition and application of its own rules and the recognition and reinforcement of regulatory activity in other institutions.

Regulation is not a governmental monopoly; there are multiple arenas of normative enterprise, innovation, and interpretation. The state's law does not preside over a landscape barren of regulation, but over a thick tangle of rivals and companions. Its effects depend on the way that it interacts with the various sorts of indigenous ordering that surround it; the core official institutions themselves are the scene of persisting and pervasive local variation. These various departures from unity and uniformity have been studied under the rubrics of private government, indigenous law, semiautonomous social fields, and local legal culture. Pluralism is very much with us: The centralist view of a monolithic integrated legal order turns out not to be a description of modern law, but part of its ideology.

Although law is the official terrain of dispute resolution, the vast majority of disputes are handled outside of formal legal institutions. Felstiner et al. (1980) introduced the dispute emergence perspective, and Miller and Sarat (1980) introduced the notion of the 'dispute pyramid.' Both emphasize the limited likelihood that legal violations will be perceived or handled formally at all, and that only a small fraction of disputes will evolve into formal trials. Morrill et al. (2010) elaborate this model by presenting a multidimensional disputing model, suggesting that most disputes are handled through extralegal processes such as talking to a friend, family member, or clergy person; prayer; or contacting the media and that others are handled through quasi-legal processes such as organizational grievance procedures. Edelman and Suchman (1999) suggest that organizations are internalizing more aspects of legal regulation over time. The continuance of *de facto* pluralism is fostered by various ideological currents,

including movements to preserve and extend cultural diversity, promote local control, and deemphasize adjudication in favor of 'alternative dispute resolution.' To emphasize the many channels for dispute resolution outside of the formal legal system, Albiston et al. (2014) suggest that the dispute pyramid metaphor is misleading and that it should be reframed as a 'dispute tree' with many branches that represent various types of legal, quasi-legal, and extralegal forms of dispute resolution. The branches are differentially accessible, with differing types of flowers (symbolic results) and fruit (substantive result).

In sum, even though law regulates increasing areas of social life, most social regulation goes on within various institutional and relational settings; only a small and unrepresentative minority of disputes proceeds to a formal legal institution for resolution. To a large but perhaps diminishing extent, when formal legal institutions devise rules to regulate conduct in institutions and relationships, they refine and restate norms that already prevail in those settings (Bohannan, 1965); legal norms in turn transform and feed rather than displace or eradicate the regulatory activity indigenous to these settings.

More Recent Themes

The sociolegal perspective in more recent times has continued to address the regulatory and procedural aspects of law but increasingly emphasizes the constitutive aspects of law, or the way in which law helps to construct both social consciousness and social action. The themes identified in the previous section are still very salient to the sociolegal perspective, but more recent scholarship tends to focus more on meaning making and social construction, as well as the role of law in everyday life. Recent sociolegal approaches also moved from a primarily American focus to a focus that is more comparative and attentive to law around the world.

The Globalization of Law

The sociolegal perspective calls attention to the wide variety of legal systems around the globe and also to the diffusion of legal norms, materials, and devices from Western Europe, lately joined and surpassed by North America as a source of legal inspiration. Voluntary reception by settler societies, the imposition of colonial rule, and importations by independent regimes seeking a badge and instrument of advancement have been followed by a worldwide spread of constitutionalism and continued influence of Western legal models to promote new forms of economic activity stimulated by increases in global trade (*see* Postcolonial Law; Law and Development). Diffusion of Western models was accelerated by the demise of communism and the subsequent importation of Western experts to write constitutions and oversee the democratization of formerly communist regimes. Comparative analyses of constitutional borrowing, adaptation, and hybridization have become prominent in sociolegal scholarship (*see* Constitutionalism, Comparative).

Notwithstanding some convergence of formal legal doctrines and institutional structures, there remains broad variation in the amount and character of litigation, the number and roles of lawyers, and the styles of dispute resolution across nations and social contexts. Even when constitutions and statutes are imported directly from one country to another, their interpretation and significance reflect persisting differences in social, political, and legal settings.

Adapted institutions may combine with local culture to produce distinctively different patterns of use. For example, in Thailand, as Engel and Engel (2010) show, disruptive changes in social arrangements and ideology cause adopted legal institutions to assume very different meanings and to be used – and left unused – in a way quite at variance with their original embodiment.

Notwithstanding persisting differences, there has been an increase everywhere in the size of the legal plant. The number of lawyers has increased. This is partly an artifact of expanding systems of higher education. But even discounting for this, the number of lawyers has grown in relation to the population and in comparison to the size of the judiciary (Galanter, 2011). Increasingly, the upper strata of these lawyers are organized in large firms that have adopted the organizational form of the large 'promotion to partnership' firm originally developed in the United States in the early twentieth century (Galanter and Palay, 1994). The growth of such firms, which provide a wide range of services to corporate entities (and some rich individuals), accelerated in the later part of the twentieth century. The spread in recent decades of this style of law practice through local adoption and by overseas branching has accentuated a striking asymmetry in the spread of legal capability.

Firms of increasingly large size, made up of highly proficient lawyers, provide a wide range of services to corporate and government entities, while individuals receive a much narrower range of services from lawyers practicing in smaller units, frequently as sole practitioners (Heinz et al., 2005; Hadfield, 2000). Services to corporate and governmental clients include preventive planning services as well as the more familiar services provided after the occurrence of a problem or predicament (Hadfield, 2009).

The global spread of legal institutions displays a pronounced tilt toward American models of large law firms, "broad empowerment of private actors to assert legal rights" (Keleman and Sibbitt, 2004: 106), and a culture of adversarial legalism (Wiegand, 1996). "Economic liberalization … [has] undermined traditional, informal, opaque approaches to regulation and pressured governments to resort to more formal, transparent, adversarial, American-style processes" (Kelemen and Sibbitt, 2004: 131). While other features of American-style legalism spread rapidly, litigation lags and becomes a smaller province of the legal realm.

The Legalization of Society

Law has become more pervasive, both as a set of social structures and as a component of consciousness, and this process is likely to continue. The latter half of the twentieth century saw a steady increase in the amount and complexity of regulation; the frequency of litigation; the number, coordination, and productivity of lawyers; the number of legal actors and the resources they devote to legal activity; the amount of information about law and the velocity with which it circulates; and a concomitant rise in consciousness of law and awareness of

legal rights (Galanter, 1992; *see* Rights: Legal Aspects; Legalization).

An increasingly global economy together with new communications technologies have fueled the rise of legal activity, in areas such as intellectual property (*see* Property: Legal Aspects; Intellectual Property: Law in Context). The number of lawyers increased dramatically in many countries and became markedly more diverse (in terms of gender, ethnicity, and class origin) (Galanter, 2011; *see* Law Firms; Lawyers). Regulation has increasingly taken on the features of adjudication (Teubner, 1987). The role of courts has been enlarged by the spread of constitutionalism and judicial review, together with an increase in multitier regulation deriving from federalism or from participation in international institutions. Increasingly, courts are accepted as the final arbiters of many public issues (Cappelletti, 1985; Constitutional Courts).

In many quarters, these changes have engendered a recoil against law and regulation, not least among elites who are best protected by the legal order. Concerns about excessive legalization, 'juridification,' 'litigation explosion,' and the dominance of lawyers have led to the advocacy of deregulation, delegalization, and embrace of alternatives to traditional litigation. The term 'alternative dispute resolution,' virtually unheard of prior to 1970, has become part of the standard policy lexicon. With the rise of forums such as mediation, minitrials, and other private or court-annexed modes of dispute processing (*see* Mediation, Arbitration, and Alternative Dispute Resolution (ADR)), the locus of some legal activity has shifted away from adjudication and into nonpublic forums, but it remains doubtful that the tide of regulation has been reversed.

As discussed below, the prospect is that the legal system has an ever-expanding agenda. But the process of remedying injustice or simply assuaging grievances consumes resources and society gets an increment of justice instead of medicine or missiles. In addition to the costs of operating legal institutions and costs borne by the participants in the legal process, the use of law to address injustice imposes another kind of cost, as it accumulates into a thick layer of rules to be learned and followed, permissions to be obtained, forms to be filled out, and records to be kept, adding to expense and burdening activity. These costs of law are visible and palpable, while the benefits of legalization are less so: Victims may enjoy vindication or honor or a heightened sense of self-worth – goods that are not subject to the same zero-sum distributional rules as money. The legal process may generate public goods by crystallizing and broadcasting norms, preventing injustice by deterrence and education, and providing channels for interaction and coordination (e.g., driving on the right or left, as the case may be). The more successful such patterning is, the less visible it is.

The Intersection of Law and Organizations

The intersection of law and organizations entails the regulatory, procedural, and constitutive facets of law. The intersection of law and regulatory law occurs as organizations respond to ambiguous legal regulation by creating internal rules that on the one hand mimic formal legal rules but on the other infuse the law with managerial prerogatives and perspectives (Edelman et al., 2001). Over time, organizational responses to law tend to become widely accepted throughout organizational fields (Edelman et al., 1999; Sutton et al., 1994).

The intersection of organizations and procedural law occurs frequently as organizations engage in litigation as a way of influencing their markets and environments (Cheit and Gersen, 2000; Dunworth and Rogers, 1996; Priest and Klein, 1984), as they hire in-house counsel who help to specify the meaning of ambiguous legislation in terms of corporate interests (Chayes and Chayes, 1984; Nelson and Nielsen, 2000; Rosen, 2002), as they internalize dispute resolution by creating internal dispute resolution systems (Edelman and Cahill, 1998; Edelman et al., 1993; Edelman and Suchman, 1999; Talesh, 2009), and by using private police forces who answer to corporate rather than public concerns (Edelman and Suchman, 1999). The internalization of law makes organizations ever more powerful legal actors in the public realm as well, and they drive up the ante by dominating the dockets, playing for favorable statutes and judicial interpretations of those statutes, and employing strategies and experts that tend to increase the cost and complexity of the legal game.

The intersection of organizations and the constitutive realm of law occurs in several ways. First, organizations respond to ambiguity in their legal environments by creating a variety of 'symbolic structures' like antidiscrimination policies that symbolize attention to legal ideals but do not guarantee that organizational practices will further those ideals. Once in place, organizational structures become sites in which legal rights are constructed and often transformed. Edelman et al. (2001) show how legal constructs tend to be infused with managerial meaning and values over time, or 'managerialized.' Albiston (2005) shows how ideas about work and wages constrain employees' use of rights created under the Family and Medical Leave Act. Similarly, Marshall (2005b) shows how managerialized conceptions of law prevent employees from mobilizing their civil rights generally. Over time, compliance tends to be understood in terms of organizations' symbolic structures, irrespective of whether those structures further legal ideals. Thus, organizational responses to law tend to become institutionalized or taken for granted not only among organizations and actors within organizations but also among litigants, lawyers, and ultimately judges. This in turn produces 'legal endogeneity' or law that incorporates the ideas and perspectives of the social realms that it seeks to regulate (Edelman et al., 2011, 1999; *see* Organizations and the Law).

Social Movements and Law

Like organizations, social movements intersect with the regulatory, procedural, and constitutive facets of law. Social movements often seek to influence regulatory law by, for example, seeking stricter environmental regulation or more progressive stances on sexuality (Andersen, 2005). Social movements also consciously violate regulation when they engage in civil disobedience to protest nuclear energy, animal experimentation, or abortion provision. Social movements engage the procedural aspects of law when they litigate to advance a cause or seek injunctions to stop pollution (Sarat and Scheingold, 2006).

But social movements also help to shape the meaning of law, engaging the constitutive element of law, when they advance new 'frames' or ways of understanding the world by challenging well-accepted institutions (Benford and Snow, 2000). Notions of 'green construction,' 'reproductive justice,' and 'gay marriage,' for example, work their way into everyday language and understanding in ways that ultimately influence law. Social movements may empower individuals to engage in 'rights talk' to negotiate social benefits (Engel and Munger, 2003; Minow, 1987; Williams, 1991). Legal activists may use legal tactics as a tool for changing people's perceptions about stigmatized groups (Kostiner, 2003; Silverstein, 1996). In his analysis of the pay equity movement, for example, McCann (1994) shows how even failed attempts at legal change can serve to mobilize political action by shaping peoples understandings of social issues.

Recent sociolegal scholarship on social movements shows how law can provide a vocabulary for describing injustice (Albiston, 2005; Marshall, 2003), how law can mobilize social movement activity by shaping social identities (Diller, 2003; Engel and Munger, 2003; Yashar, 2005), and how legal change may prompt countermobilization (Goldberg-Hiller, 2002; Luker, 1984; Tushnet, 1987). Law also helps to shape activists' understandings of what types of claims are valid and what types of solutions are just (Edelman and Cahill, 1998; Ferree, 2003; Haney-López, 2000; Jenness, 1999). Recent approaches also call attention to the ways in which organizations, social movements, and law interact to shape understandings of social issues, rights, and the potential for change (Edelman et al., 2010).

Legal Consciousness, Rights Consciousness, and Legal Culture

The constitutive facet of law emphasizes meaning making and gives more attention than did the earlier perspectives to legal consciousness and legal culture, terms that are used to identify widely shared meanings either about law or that originate from law. Legal consciousness generally refers to how individuals think about law, whereas legal culture refers to aggregate understandings about law (Ewick and Silbey, 1998; Merry, 1990; Nelken, 1997; Sarat, 1990; Scheingold, 1974; *see* Legal Culture and Legal Consciousness; Law and Everyday Life).

Studies of legal consciousness and legal culture have called attention to the ways in which legal ideas influence every day social life in ways that might not previously have been understood as legal. Particular attention has been paid to rights consciousness, or the extent to which people recognize and mobilize their legal rights. Formal legal rights, for example, even when they are difficult to realize in court, may allow disenfranchised citizens to make claims against more powerful entities (Minow, 1987; Williams, 1991). Legal consciousness helps to explain when people mobilize the law and why they choose not to (Albiston, 2010; Bumiller, 1988; Marshall, 2005a; Nielsen, 2004), how people think about public welfare bureaucracies (Sarat, 1990), and when and how people encounter the law and why and how they resist law (Ewick and Silbey, 1992).

New and Developing Themes in the Sociolegal Perspective on Law

The sociolegal perspective on law continues to elaborate the regulatory, procedural, and constituent facets of law. Many of the new themes within this perspective are motivated by new societal challenges such as evolving technologies and technological possibilities (Berman, 2007; Elkin-Koren, 1996; Ross, 2002); the rise of a 'risk society' (Baker and Simon, 2002; Beck, 1992; Ericson and Haggerty, 1997; Giddens, 1999); global warming and the increasing number of natural disasters (Gunningham et al., 2003; Hartman and Squires, 2006); ethnic conflict and violence around the globe (Hagan and Rymond-Richmond, 2009; Ivković and Hagan, 2006); the transition from nations at war to the 'war against terror' (Hagan et al., 2008; Hirsch, 2008; Thacher, 2005); demographic movements through immigration and emigration, which raise new questions of citizenship (Boyle and Busse, 2006; Menjívar and Abrego, 2012; Wiles, 2007); the rise of global capitalism and corporate power (Carruthers and Halliday, 2006; Shamir, 2004); problems faced by new democracies seeking to craft constitutions (Elkins et al., 2009; Epstein et al., 2001; Ginsburg, 2003); the increasing role of nongovernmental organizations and other nonstate entities in rule making and meaning making; and the interplay between these entities and states in influencing international orders (Boyle and Preves, 2000; Davis et al., 2010; Massoud, 2011; Trubek et al., 2000).

The sociolegal perspective increasingly recognizes the nexus between a changing social world and changing notions of law and justice. The scope of potential legal intervention expands with these new challenges as well as with the growth of knowledge and the development of technology. The sociolegal perspective sees the realm of injustice as enlarged as events that were once seen as natural come to be seen as capable of being controlled by human institutions (Shklar, 1990). Hurricanes are misfortunes, but bungled relief efforts are injustices. The focus on the constitutive facet of law reveals that our consciousness of injustice increases as the potential for legal solutions increase.

The Sociolegal Perspective in Sum

This article necessarily gives short shrift to many topics within the sociolegal perspective on law. It is intended more to give a feel for the breadth of the perspective and its emphasis on understanding the interplay between law and its social context. From its early critique of legal formalism and emphasis on the gap between 'law on the books' and 'law in action,' the sociolegal perspective has evolved into a multidisciplinary and interdisciplinary analysis of law at every level of society. Studies of regulation focus not just on impact but also on the social inequalities at play in the construction of regulation, in its implementation, and in its interpretation. Studies of procedure focus not just on law as a strategy but also on the meaning making, moral judgments, and power plays that pervade every legal move. Studies of the constitutive of power of law now incorporate attention to regulation and procedure and focus on broader issues of legal consciousness, rights consciousness, social resistance, and the role of law in everyday life.

Abstract

Conflict of laws is the body of law through which each state (or country) seeks to resolve international or interstate private-law disputes between persons or entities other than states as such. A dispute is international or interstate if one or more of its constituent elements, such as the events that give rise to the dispute, the location of its object, or the parties' nationality, citizenship, domicile, residence, or other affiliation, are connected with more than one country or state. Conflicts law consists of three parts: (1) jurisdiction concerns which of the involved states' courts or other organs will adjudicate the dispute; (2) choice of law concerns whether the merits of the dispute will be resolved under the substantive law of the state of adjudication or instead under the law of another involved state; and (3) judgment-recognition concerns the requirements under which the courts of one state will recognize and enforce a judgment rendered in another state.

Definitions

Conflict of Laws

The term 'conflict of laws' describes generally the body of law that seeks to provide solutions to international or interstate legal disputes between private or public persons or entities other than countries or states as such. A dispute is considered international, interstate, or multistate if one or more of its constituent elements is connected with more than one country or state. For brevity's sake, the word 'state' is used hereafter to denote any country or any territorial subdivision of such country, such as a state or province, that has its own system of private law. The law of conflict of laws deals with both international (country-to-country or country-to-state) and intranational (state-to-state) cases, so long as they have one or more foreign elements. These elements may relate to the parties' nationality, citizenship, domicile, residence, or other affiliation with another state; to the location of the events that give rise to the dispute; or to the location of the object of the dispute. Examples of such cases include contractual disputes between citizens of different countries or domiciliaries or residents of different states; torts resulting from conduct occurring in one state and causing injury in another state or involving domiciliaries of different states; or property disputes between residents of one state regarding assets situated in another state.

Private International Law

The term 'conflict of laws' was coined in Europe by the Dutch jurist Ulricus Huber (1624–94) and is the term primarily used in the United States, Canada, and more recently in England. In the rest of the world, the corresponding term is 'private international law,' which was coined in the United States by Justice Joseph Story (1779–1845). These two terms reflect different and also debatable assumptions about the nature, scope, and function of this subject.

The term conflict of laws seems to assume that (1) in all multistate cases, each involved state has an active or passive desire, claim, or 'interest' to apply its own law; (2) these claims 'conflict' in the sense of always pulling in opposite directions; and (3) there exists an impartial mechanism of hierarchically superior authority for refereeing these conflicts. These assumptions have been questioned throughout history. For example, even accepting the propriety of using anthropomorphic terms to describe state objectives, one can question whether (or why) a state would be interested in the outcome of disputes between private persons. Similarly, one can question whether such a state interest is implicated in each case connected with that state, or whether the application of that state's law indeed effectuates that interest.

The term private international law seems less loaded and more descriptive, but also more idealistic than the term conflict of laws. The word international describes an important attribute of the disputes that fall within the scope of this subject – they are international (or interstate) in that they have contacts with more than one state. The word private serves a dual function: (1) it confines the scope of this subject to private-law disputes, namely disputes between private persons other than a state in the exercise of governmental authority; and (2) it distinguishes this subject from public international law, also known as the law of nations, which regulates the conduct of sovereign states, analogous entities, and international organizations at the international level (*see* International Law and Treaties).

However, the word private also allows an inference that the disputes that comprise this subject implicate only the interests of the disputants and not the interests of their respective home states or the states that have other pertinent contacts with the dispute. Many critics have questioned this inference, especially during the last half century. Similarly, the word international allows the inference that this law emanates from a supranational source. Reality is much different. Aside from a few international conventions that avoid or resolve conflicts through substantive or conflicts rules, international law provides little guidance on the subject. Nevertheless, the word international reflects the initial internationalist aspirations of this field, especially in the nineteenth century. The classic school of private international law taught that, in entering this field, national lawmakers should act as surrogates of a nonexistent international legislature. They should act unselfishly, impartially, and evenhandedly, treating equally foreign and domestic laws, as well as foreign and domestic litigants. They should aim for international harmony and uniformity by adopting only those rules that would be capable of 'internationalization' through their adoption by

 http://dx.doi.org/10.1016/B978-0-08-097086-8.86064-X

other nations. How much, if any, of this initial idealism survives today is very much debatable.

The Sources of Conflicts Law

Thus, despite the appellation international, private international law or conflicts law is essentially national law in the sense that each country decides for itself how to resolve multistate private-law disputes, subject to relatively mild restraints imposed by public international law or suggested by international comity. From the perspective of federal countries, national law usually means federal law. Indeed, in most federal countries, the resolution of both international and intranational conflicts of laws falls within the competence of the central law–making body. However, in the United States, the resolution of interstate conflicts as well as conflicts between state law and foreign law (as opposed to conflicts between federal law and foreign law) is primarily left to the individual states, despite the existence of a federal constitutional power to federalize the entire field.

The Source of Conflicts of Laws

Legal Diversity

Conflicts of laws occur because each state has its own system of private law and because human activity often is not confined to a single state. If either one of these conditions is missing, conflicts do not arise. One who lives in complete isolation and avoids contact with nonlocal residents and foreign products need not be concerned with conflicts of laws. Similarly, one whose contacts with nonlocals are confined to residents of states that have identical laws would not need to be concerned with problems caused by legal diversity. Needless to say, human activity transcends national borders, and countries do have different laws. For example, the contracts law of France differs from that of England, which in turn differs in some respects from that of Scotland, and the torts law of the Mexican province of Sinaloa differs from that of the State of Arizona, which in turn differs from that of California. Indeed, differences exist not only between countries that belong to different legal traditions, such as France and England which belong to civil-law and common-law traditions, respectively (*see* Legal Systems, Classification of), but also between countries that partake of the same legal tradition, such as France and Italy, or England and the United States, respectively. Moreover, such differences also exist as between or among the component units of a single country, such as the states of the United States, or the provinces of Mexico or Canada, or in the United Kingdom between England and Scotland (*see* Legal Pluralism).

Interpersonal or Intertemporal Conflicts Law

This legal diversity is usually coextensive with a distinct territory that is administered by a governmental unit with authority over that territory. In some instances, however, the existence of a distinct body of law, such as family law, the law of personal status, or the law governing indigenous tribes, is not attached to a particular territory but rather to a particular ethnic or religious group, regardless of territory. Conflicts among these laws are referred to as interpersonal or interreligious conflicts and are not discussed here. Also not discussed here are the so-called intertemporal conflicts of laws, namely conflicts that arise when a law purports to regulate, or is sought to be applied, to events or transactions that occurred before its enactment (retroactive application).

The Three Parts of Conflicts Law

While many problems of conflict of laws are resolved through negotiation, mediation, or arbitration, a good number of them end up in litigation. In planning for this eventuality, or when forced to confront it, parties involved in multistate activity must keep in mind three major questions: (1) Where can or should litigation be initiated? (2) Which law will the court apply? (3) Where can the resulting judgment be enforced? These three questions correspond to the three consecutive phases that comprise the process of judicial resolution of most conflicts problems: (1) jurisdiction, (2) choice of law, and (3) recognition and enforcement of judgments. In the United States and other common-law systems, these are also the three major divisions of the law of conflict of laws. In contrast, in civil-law systems, jurisdiction and judgment-recognition form part of international procedural law rather than of private international law, which deals primarily with choice of law and secondarily with the law of nationality and citizenship and the condition of aliens.

The jurisdictional question and the choice-of-law question are analytically distinct questions, although in many cases they are practically interrelated. Indeed, the two questions are oriented in different directions and seek to satisfy different ends. The jurisdictional question focuses on the relationship between the defendant and the state of litigation (forum state) and asks whether that relationship is sufficiently close as to justify subjecting the defendant to litigation in that state and utilizing that state's judicial resources to adjudicate the particular dispute. The choice-of-law question focuses on both parties and their dispute and seeks to identify that state, be it the forum state or another state, whose relationship to the dispute is such as to render most appropriate the application of its law to the merits of the dispute. In many cases, the same relationship that forms the basis of a state's jurisdiction to adjudicate the case can also be the basis for applying that state's law to the merits. This, however, is by no means true in all cases.

As said previously, the law of conflict of laws does not deal with public-law disputes, namely, disputes involving a state in the exercise of governmental authority, such as in the enforcement of its criminal laws. Indeed, in such disputes, all three of the above questions are merged into one – the question of jurisdiction. When a state has jurisdiction to try a criminal case, that state applies its own law and enforces the resulting judgment. It does not apply the criminal laws or, strictly speaking, enforce the criminal judgments of another state. Cases in which more than one state has concurrent jurisdiction, such as cases involving transborder crimes, are addressed and resolved as jurisdictional conflicts – for example, through extradition – rather than as choice-of-law conflicts.

Jurisdiction

In its broadest sense, jurisdiction is the power of a decision-maker to resolve a dispute in a binding manner. When, as in the context pertinent here, the decision-maker is a court or other tribunal, the dispute is resolved through adjudication and the power to do so is called judicial or adjudicatory jurisdiction. It can be contrasted with legislative or prescriptive jurisdiction, which is the power to enunciate norms governing the merits of the dispute.

The source of judicial jurisdiction is the law that constitutes the particular court and thus it is a national or state law rather than a supranational or suprastate law. However, in some countries, the exercise of jurisdiction is restricted by international treaties. In some federal systems like the United States, the exercise of jurisdiction by the constituent states must conform to certain outer limits imposed by federal law, primarily the due process clause of the federal constitution. A similarly uniform regime of jurisdiction (and judgment-recognition) exists within the European Union (but only with regard to defendants domiciled within the Union) after the adoption of the Brussels I Regulation (previously the Brussels Convention). Although these superarching sources impose a certain degree of uniformity on the affected states, the jurisdictional laws of the various countries or states continue to differ widely in both nomenclature and substance.

Thus, each state delineates for itself the bases on which its courts are authorized to adjudicate cases with nonlocal elements (jurisdiction in the international sense) and then allocates internally that authority among the various geographical subdivisions or judicial districts within that state (internal or local jurisdiction or venue) and among its various general or specialized courts, tribunals, or other adjudicating agencies in each locality (competence or subject-matter jurisdiction). To render a valid judgment, a court must, in the absence of acquiescence by the defendant, satisfy all three types of jurisdiction.

In the United States, for historical reasons, a state court's interstate or international jurisdiction is divided into personal jurisdiction (*in personam*) and jurisdiction over things (*in rem*). Personal jurisdiction, which is the power to adjudicate claims against a defendant and to bind him or her personally, is further subdivided into general and specific jurisdiction. General jurisdiction exists when the defendant is domiciled, incorporated, has its principal place of business, or conducts 'continuous and systematic' business in the forum state. Historically, the service of process on the defendant within the territory of the court was also a basis of general jurisdiction, but the constitutionality of this basis is now questionable, at least when it is not supported by other defendant contacts. When a court has general jurisdiction, the court may adjudicate any claims against the defendant, even claims unrelated to the defendant's contacts with, or activity in, that state. In contrast, when a court has only specific jurisdiction, the court may adjudicate only claims against the defendant that arise from the defendant's contacts with, or activity in, the forum state.

Jurisdiction over things is based on the presence of a thing within the territory of the forum state and is subdivided into jurisdiction *in rem* and *quasi in rem*. When the lawsuit seeks to determine the parties' rights in, or relating to, that thing, the court has jurisdiction *in rem* and may adjudicate those rights even if it does not have personal jurisdiction over the defendant. In contrast, when the lawsuit seeks to vindicate claims against the defendant that are unrelated to that thing, the court is said to have *quasi in rem* jurisdiction. Since 1977, this basis of jurisdiction is – in the absence of other defendant contacts – constitutionally insufficient unless the claim has been previously reduced to a judgment rendered by another court that had jurisdiction over the defendant.

In other countries, jurisdictional bases are in some respects broader and in other respects narrower than those just described. For example, some European countries theoretically allow the exercise of what might be called *quasi in rem* general jurisdiction, namely, the adjudication of claims against a defendant who owns property situated in the forum state, even if the claims are unrelated to the property or vastly exceed its value. (The Brussels I Regulation prohibits the use of this basis against defendants domiciled within the European Union.) On the other hand, while most countries agree that the defendant's domicile, incorporation, seat, or principal place of business in the forum state is a basis for general jurisdiction, they reject general jurisdiction based on either service of process alone or 'doing business' within the forum state.

Beyond this, most countries and states agree that the defendant's actual or imputed consent is a sufficient basis of jurisdiction even when jurisdiction is otherwise lacking, that contractual claims can be adjudicated in the place where the contract was to be performed, and that claims arising from torts can be adjudicated in the place where the wrong was committed or the injury foreseeably occurred.

Because of the differences between the jurisdictional bases recognized by the various states, but also because, even when they do not disagree, these states may authorize more than one jurisdictional basis for certain categories of cases, a given case may often be subject to the concurrent jurisdiction of more than one state. In such a case, the plaintiff, who always has the choice of where to file the lawsuit, may 'shop' for the most advantageous forum, a phenomenon known as 'forum shopping.' One of the mechanisms devised by common-law systems to discourage this phenomenon is the doctrine of forum *non conveniens*, which allows a court to decline to adjudicate the lawsuit if, despite the existence of jurisdiction, litigation in that state would be seriously inconvenient and provided that another more convenient forum is available to the plaintiff. Another mechanism that is sanctioned in varying degrees by most systems but is available only when the disputants are parties to a preexisting contractual relationship, is a 'choice-of-forum' clause, namely a clause by which the parties agree that disputes arising from that relationship will be litigated in the courts of the agreed-upon state.

Choice of Law

When a court exercises its jurisdiction to adjudicate a case with foreign elements, the court applies its own procedural law to the conduct of the proceedings before it. With regard to the merits of the case, however, the court may or may not apply its own substantive law. This is the choice-of-law question and it is answered by the forum's choice-of-law rules, which may be established legislatively (as in most civil-law systems) or

through judicial precedent (as in most common-law systems, including those of the United States). These rules may point either to the law of the forum state or to the law of another state, depending, inter alia, on each state's pertinent contacts with the case. For example, in tort cases, these rules may point to the state where the tort was committed (*lex loci delicti*) or the injury occurred (*lex loci damni*), in contract cases to the state where the contract was made (*lex loci contractus*), and, in cases involving immovable property, to the state where the property is situated (*lex rei sitae*).

The above rules are typical of what is usually referred to as a traditional choice-of-law system. For much of the twentieth century, these rules and others like them were more or less uniformly followed in most countries. These rules place a high premium on providing certainty and predictability in the choice of the governing law, leaving little room for judicial discretion. As the above examples illustrate, these rules give no preference to the forum state, and indeed they aspire to produce international or interstate uniformity, that is, make it more likely that each multistate case will be governed by the same law regardless of where the case is litigated. The choice of the governing law is based not on the content of the laws of the involved states but rather on the territorial or other contacts of those states to the case at hand. Once a state is found to have the predesignated contact, e.g., the place of the injury, that state's law is applied almost automatically and – save for a few limited exceptions – regardless of its content, its underlying policy, or the substantive quality of the result that such application produces. Indeed, the objective of the traditional choice-of-law process is not supposed to be to ensure a substantively just result (*material justice*), but rather to ensure the application of the spatially appropriate law (*conflicts justice*).

Traditional choice-of-law rules like the ones described above continue to be followed in many countries, including about a dozen states of the United States. However, in the 1960s, a movement emerged in the United States which has been characterized as a conflicts revolution, and which appeared to reject both the rules and the goals of the traditional choice-of-law process. At least in tort and contract conflicts (which are the most numerous), preconceived choice-of-law rules were abandoned in favor of various approaches, which, although different in many respects, reject the notion of preselecting the applicable law on the basis of a single territorial contact and instead leave the selection to be made by the court on a case-by-case basis. The choice is to be based on multiple contacts and factors, such as the content of the conflicting substantive laws and their underlying policies, the presumed interests or claims of the involved states to apply their respective laws, and the substantive quality of the result that the chosen law will produce in the individual case.

Parallel movements have also appeared in other countries, though nowhere with the same intensity. For example, European systems now appear more willing than in the past to entrust courts with a certain degree of flexibility in choosing the applicable law. Although most of these systems still rely on statutory choice-of-law rules, the rules enacted in the last four decades are 'softer' than those of the preceding era. For example, some of these rules base the choice of the applicable law not on a single territorial contact but rather on multiple contacts, usually described by the phrase 'strongest' or 'closest connection,' while other rules contain clauses that authorize courts to deviate from the predesignated law in appropriate circumstances, depending on the needs of the particular case. Some of these features can be seen in the European Union's 'Rome I' and 'Rome II' Regulations, which provide for the law governing contractual and noncontractual obligations, respectively.

As a result of the above movements, the choice-of-law process at the beginning of the twenty-first century is more flexible, less predictable, and more ethnocentric than it was only one generation earlier. The possibility that the forum state will apply its own law to most multistate cases adjudicated by its courts is now greater than in much of the previous century, especially in the United States. In turn, this increases the possibility that a given case will be governed by a different law depending on where it is litigated, and this in turn reinforces the incentive for forum shopping described earlier.

Yet, while national conflicts systems have been gradually diverging in most respects, they have also been converging in at least one important respect. Most of them now recognize the principle of party autonomy, which grants contracting parties the power to agree in advance on the law that will govern disputes arising from their relationship. Although this is an ancient principle whose origin can be traced as far back as ancient Greece, it has had a checkered history through the centuries. By the second half of the twentieth century, however, party autonomy acquired the status of a universal principle and is now sanctioned in one form or another by most countries in the world. In fact, some of these countries have extended this principle beyond ordinary contracts and have made it available to matrimonial agreements, other family-law agreements, and even unilateral juridical acts such as testaments.

The use of a choice-of-law clause, especially when combined with a choice-of-forum clause or an arbitration clause, can provide parties with a modicum of predictability. This is a good antidote to the uncertainty generated by the movements described above. This antidote, however, can only work in some cases. For example, the principle of party autonomy is not available in cases such as torts, in which the disputants are not parties to a preexisting relationship. Second, while this principle is recognized in most countries, it is also subject to several limitations and exceptions that differ from country to country. Thus, the possibility remains that choice-of-law clauses can be enforced in some countries but not in others, along with the possibility of a different outcome depending on where the case is litigated.

Recognition and Enforcement of Foreign Judgments

One of the many differences between local and multistate cases is the increased possibility that in multistate cases a judgment may have to be enforced in a state other than the one in which it was rendered. This will be the case if the defeated litigant (judgment debtor) does not voluntarily comply with the judgment and does not have sufficient assets in the forum state against which the successful litigant (judgment creditor) can execute the judgment. In such a case,

the creditor will seek to have the judgment recognized and enforced in another state that has jurisdiction over the debtor and in which the debtor has sufficient assets. This section discusses the requirements under which the second state will recognize such a judgment.

As between states of the United States, these requirements are prescribed by federal law, primarily the Full Faith and Credit Clause of the Constitution. As interpreted by the Supreme Court, this clause requires each state to give to a judgment of a sister state the same effect that the judgment had in the state of rendition, provided that the judgment is 'final,' it is 'on the merits,' and it was rendered by a court that had jurisdiction under its own law which must conform with federal due process standards. Once these requirements are met, the judgment must be recognized and may not be reviewed on the merits, even if it applied the wrong law or reached a result that contravenes the public policy of the second state. The reason for this strict regime is the national policy of finality embodied in the doctrine of *res judicata*, which seeks to conserve judicial resources and protect party expectations by prohibiting relitigation of disputes that have been finally decided. In 1996, the Defense of Marriage Act (DOMA) introduced the only exception to this regime by providing that "(n)o State shall be required to give effect to any … judicial proceeding in any other State … respecting a relationship between persons of the same sex that is treated as a marriage under the laws of such other State … or a right or claim arising from such a relationship."

The Full Faith and Credit Clause does not apply to the judgments of foreign countries and thus American courts are not constitutionally compelled to enforce such judgments. Nevertheless, as a matter of comity, American courts recognize foreign-country judgments that meet the requirements for recognizing a sister-state judgment, but also reserve the right to refuse recognition on certain grounds that are not available with regard to sister-state judgments. For example, recognition may be refused if the judgment does not satisfy American jurisdictional standards, even if it does satisfy the foreign-law standards; if the judgment is one for taxes or penalties; or if it was rendered in a system that does not provide impartial tribunals or does not satisfy certain minimum standards of procedural fairness, or contravenes the public policy of the recognizing court.

In many other countries, foreign judgments are recognized under similar but somewhat less hospitable standards. For example, in some countries, recognition depends on whether the rendering court had applied the law that would have been chosen under the choice-of-law rules of the recognizing court or had reached a substantially equivalent result. In other countries, recognition is usually denied on public policy grounds to judgments awarding 'excessive' sums of money, especially American judgments imposing punitive damages. Finally, some countries condition recognition on reciprocity, that is, on whether the country of rendition would recognize similar judgments from the second country, while other countries refuse recognition outright in the absence of a treaty requiring such recognition.

One such treaty was the Brussels/Lugano Convention on Jurisdiction and the Recognition and Enforcement of Judgments among the member states of the European Union and the European Free Trade Association. This Convention established a comprehensive regime for jurisdiction and judgment-recognition that approximates in important respects the regime that exists within the United States. With regard to defendants domiciled in a member state, the Convention defined the permissible bases of jurisdiction and then provided that a judgment rendered by a court that satisfies those bases must be recognized in the other member states without review of the merits and subject to only limited exceptions such as public policy, lack of proper and timely notice, or conflict with a prior judgment entitled to recognition under the Convention or a judgment of the recognizing state. In 2001, the Brussels Convention was converted into a Regulation (known as 'Brussels I'), which is directly binding on 26 of the 27 EU countries, and, in 2007, the Lugano Convention was accordingly renewed.

In 2005, a Convention on Choice of Court Agreements was negotiated under the auspices of the Hague Conference of Private International Law. The Convention provides for the recognition of judgments rendered by a court chosen by the parties under a choice-of-court agreement. The Convention has been signed by the European Union and the United States but it is not yet in force.

This article is a revision of the previous edition article by E. Chambliss, volume 12, pp. 8559–8564, © 2001, Elsevier Ltd.

Abstract

This article explains that the topic of 'regulation of lawyers' can be difficult to research because of jurisdictional differences in the meaning of the term lawyer and because of differences in the sources and types of lawyer regulation and differences in the reserved activities for which one needs to be a licensed lawyer. Although there is no centralized source that identifies lawyer regulators in different jurisdictions or the content of that regulation, this article identifies resources that can be useful when researching lawyer regulation. The article also identifies current issues and changes that have occurred in lawyer regulation.

Introduction

This article focuses on the contemporary regulation of lawyers (see Section Definitions). For useful perspectives about the goals and intention of lawyer regulation and for historical information, see the articles on Lawyers, Professionalization/Professions in History, Legal Education, and Law Firms.

Definitions

Before addressing the regulation of lawyers, there are several definitional issues one must resolve. What does one mean by the term 'lawyer'? What does one mean by 'regulation'? What time period of regulation is one referring to? Should one refer to the 'regulation of legal services' rather than 'regulation of lawyers?'

According to the "1998 Background Note on Legal Services" by the World Trade Organization (WTO) Secretariat, experts have identified the following as the main legal families: Romano-Germanic law (which usually referred to as civil law), common law, socialist law, Hindu law, Muslim Law, laws of the Far East, and black Africa and Malagasy law. The University of Ottawa's Juriglobe website identifies the type of legal system used in most countries in the world, including whether the country has a mixed legal system. This article focuses primarily on the regulation of lawyers in civil law and common-law systems. Socialist law has largely disappeared and that some countries in Africa and Asia have common law or civil law systems.

Comparing the regulation of lawyers from different jurisdictions requires a shared definition of 'lawyer.' Yet the Anglo-American common law concept of 'lawyer' has no counterpart in civil law countries because most civil law countries do not have a unified legal profession. Instead, civil law countries recognize multiple legal occupations, such as judge, prosecutor, civil servant, and private practitioner, with private practitioners typically constituting a relatively small proportion of the total. Furthermore, in civil law countries, the list of 'legal' occupations includes jobs that in common law countries would be performed by those without legal training, such as notaries (everywhere), police chiefs (in Brazil and Norway), and bailiffs and process servers (in France). None of these groups sees itself as part of a unified legal 'profession'; typically, each group has its own occupational associations and licensing criteria (Abel, 1988). In some jurisdictions, such as Belgium and certain other jurisdictions in Europe, legal professionals who provide legal services solely for their employers are not regarded as independent and therefore are not entitled to professional privilege nor are they entitled to register as a licensed (private practitioner) lawyer (Fish, 2004; Terry, 2011). For systems with a divided rather than a unified legal profession, this article focuses primarily on lawyers in private practice, rather than prosecutors, in-house counsel, judges, civil servants, or others. For additional information, *see* Lawyers: Social Organization of the Profession; Prosecution; In-House Counsel.

Comparing the regulation of lawyers from different jurisdictions also requires an understanding that there are significant variations among jurisdictions with respect to the activities that are reserved exclusively to 'lawyers' (as that term is defined previously). Some jurisdictions, such as Finland and Sweden, have no reserved activities for lawyers, whereas other jurisdictions, such as Italy, limit reserved activities to courtroom appearances, and still other jurisdictions have a much broader monopoly for their lawyers (Paterson et al., 2003). The United States and Germany are examples of jurisdictions that have a broad monopoly that includes transactional work as well as appearance before a court (ABA CPR, Task Force on the Model Definition of the Practice of Law; Paterson et al., 2003). Some jurisdictions, such as England and Wales, reserve specified litigation and limited transactional work, such as property conveyance, but they have a broad space in which those who are not licensed solicitors or barristers may operate (U.K. Legal Services Act, Section 12 and Schedule 2). If someone who is not authorized engages in activities reserved to lawyers, they sometimes are said to be engaging in the 'unauthorized practice of law.' It is worth noting that there also can be significant differences of opinion within a jurisdiction as to whether a particular activity is reserved to lawyers, as has happened in India, the United States, and elsewhere (Krishnan, 2010; Rhode, 1981). Thus, to fully understand a particular jurisdiction's regulation of lawyers, it is useful to be familiar with the scope of activities reserved to lawyers in that jurisdiction and whether there are any controversies with respect to that issue.

Turning to the question of 'what is regulation,' one must understand that many different entities and many different

sources of law and norms affect lawyer conduct and serve a regulatory function (Wilkins, 1992). These include formal regulators, such as legislatures, law societies, courts, and frontline regulatory entities. Lawyers are subject to less formal or official sources of regulation by malpractice insurance carriers, risk management and ethics advisors, clients, the news media, judges, professional organizations, nongovernmental organizations (such as the American Law Institute), custom, and peer pressure (Chambliss and Wilkins, 2002; Davis, 1996; Whelan and Ziv, 2012). Governmental and nongovernmental international entities, such as the WTO, the Financial Action Task Force, the International Bar Association (IBA), and the *Union Internationale des Avocats*, may operate as soft-law regulators (Terry, 2008a). Although there are many different types of regulators and many different sources of regulation, when this article refers to 'lawyer regulation,' its focus is on formal sources of regulation. As will be noted, there are significant jurisdictional variations in the identity of the formal regulators and in the number of formal regulators in each jurisdiction.

The next definitional issue is whether the term 'lawyer regulation' is intended to encompass regulation regarding: entry into the profession, the rules governing a lawyer's conduct (e.g., rules governing competence, confidentiality, conflicts of interest, fees, and advertising), and the conditions under which one is sanctioned or expelled from the profession. Although commentators sometimes use the term 'lawyer regulation' as a short-hand reference to ethics codes and thus the second kind of regulation, in many jurisdictions 'regulation of lawyers' refers to all three time periods in the life cycle of a lawyer (Terry et al., 2012a). For example, in the Canadian provinces, the same entity may have the primary responsibility for such regulation of lawyers during all three stages of the lawyer's life cycle (Federation of Law Societies of Canada (FLSC), National Regulatory Initiatives). In other jurisdictions, such as US jurisdictions, there may be a different frontline regulator for the entry stage (e.g., a Board of Bar Examiners), for the conduct stage (e.g., the state's highest court), and for the discipline or end stage of a lawyer's life cycle (e.g., an Office of Disciplinary Counsel) (Terry et al., 2012a). In this article, 'regulation of lawyers' refers to regulation of all three time periods.

The final definitional issue is an observation that the title of this article – regulation of lawyers – implicitly assumes that regulation is of lawyers rather than regulation of legal services. As commentators have noted (Susskind, 2008), globalization and technology have made it easier to disaggregate and commodify all or parts of legal work and for nonlawyers to offer services previously considered to be legal services reserved to lawyers. Accordingly, some lawyer regulators now are explicitly asking whether they should regulate lawyers or legal services (Terry, 2013). This article focuses on the regulation of lawyers, but highlights this issue of whether regulation should focus on services or providers.

Current State of Knowledge about Lawyer Regulation

The study of lawyer regulation is a relatively young academic field that builds on prior work. Historically, lawyer regulation and legal ethics tended to be taught by practicing lawyers or judges, rather than legal academics, or it was included in on-the-job training or as part of an apprenticeship (Moliterno, 1991). Some of the earliest and best academic literature was grounded in the fields of history and sociology (Abbott, 1988; Abel and Lewis, 1988–89, Abel, 2008; Gordon 1988, Heinz and Laumann, 1982; Rueschemeyer, 1986).

In the United States, this field grew significantly in the 1970s and 1980s. In 1969, the American Bar Association (ABA) adopted its Code of Professional Responsibility, and in 1974, in the aftermath of the Watergate scandal in which a number of lawyers were involved, the ABA first required that legal ethics be taught in ABA-accredited law schools (Clark, 2000). This ABA action was influential because most US states require attendance at an ABA-accredited law school as a condition of taking a bar exam and becoming a lawyer (National Conference of Bar Examiners (NCBE) Comprehensive Guide to Bar Admissions, 2013). One consequence of the ABA's actions was a burgeoning cadre of academics who specialized in legal ethics codes and other rules related to the regulation of the legal profession. As this field evolved, scholars began to call for a rethinking of the traditional regulation paradigm. Rather than focusing only – or primarily – on professional self-regulation by way of ethics codes, scholars called for increased attention to other sources of regulation, such as judicial, legislative, and administrative action; malpractice; liability and risk management; and constitutional and international law (Cone, 1996; Davis, 1996; Freedman, 1990; Luban, 1988; Morgan, 2010; Pearce and Wald, 2012; Schneyer, 1991, 2008; Wilkins, 1992). Thus, in the United States, the field of study that used to be called 'legal ethics' increasingly is referred to more broadly as 'the law governing lawyers' (American Law Institute, Restatement, 2000). In 2009, the Professional Responsibility Section of the Association of American Law Schools published the results of a survey regarding the scope of US professional responsibility/legal ethics courses. There were 105 responses from 77 different law schools; survey questions addressed topics that included when the course was taught, the number of units, the type of instructor, the topics addressed in the course, assessment methods, course philosophy, and advice for new teachers (AALS, 2009).

Elsewhere in the world, there has been growing academic interest in the topic of lawyer regulation. Canada has a number of scholars, books, and articles devoted to this field (Cotter et al., 2012; Dodek, 2008; Woolley, 2011). In 2012, Canadian scholars established the Canadian Association for Legal Ethics. Australia, New Zealand, and the United Kingdom are home to a number of academics who specialize in lawyer regulation; they have written books and journal articles and have issued reports commissioned by regulators (Boon and Levin, 2008; Dare and Wendel, 2010; Faulconbridge et al., 2012; Fleming and Shackel, 2013; Griffiths-Baker, 2002; Nicolson and Webb, 2000; Moorehead et al., 2003; Mortensen et al., 2010; Parker and Evans, 2007; Parker and Aitken, 2011; Sommerlad et al., 2010). Some scholars study lawyer regulation in Asia (Liu, 2008; Michelson and Liu, 2010; Myerson, 1995).

Lawyer regulation also has been studied in Europe (Henssler and Prütting, 2010; Andrasi, 2013; Leubsdorf, 2001).

Although it is still relatively uncommon for European academics outside of the United Kingdom to specialize in lawyer regulation, the number of academics who do so is growing, and there are academic institutes that specialize in this topic (e.g., the University of Cologne, Institut für Anwaltsrecht). The adoption of the 1977 and 1985 European Union Directives on lawyer mobility and the 1995 WTO General Agreement on Trade in Services undoubtedly will contribute to increase scholarly interest in the topic of lawyer regulation.

The first International Legal Ethics Conference (ILEC) was held in 2004 in England; it provided a forum for academics from around the world who are interested in legal ethics and the regulation of lawyers to gather together. ILEC V was held in Banff, Canada, in 2012; its speakers and attendees came from more than 14 countries located in Africa, Asia, Australia, Europe, and North and South America. In 2010, during ILEC IV, international scholars agreed to create the International Association of Legal Ethics (IALE). The membership of IALE and the ILEC conferences demonstrate that there are a growing number of scholars from around the world who study lawyer regulation. The conference programs are available online and provide a useful resource to locate some of the most active academics in this field.

Despite the significant increase of academic professionals who study the lawyer regulation systems in their jurisdictions, the current state of cross-cultural knowledge about lawyer regulation is relatively weak. Unlike many fields, there is no single source or database to which one can look to find out which kind(s) of lawyers exist in a particular jurisdiction, the entity or entities responsible for regulating each type of lawyer in that jurisdiction, or the content of that jurisdiction's lawyer regulation. This situation is starting to change, and the final section of this article lists a number of resources, some of which were created recently, to which one can look to find out more about lawyer regulation in other countries. These information aggregators include entities commonly known by their acronyms: the ABA, Asia Pacific Economic Cooperation (APEC), Council of Bars and Law Societies of Europe (CCBE), Conference of Regulatory Officers (CORO), FLSC, IBA, Law Council of Australia, Legal Services Board (LSB), NCBE, National Organization of Bar Counsel (NOBC), Solicitors Regulation Authority (SRA), and the WTO.

Sources and Methods of Lawyer Regulation

As noted in Section Definitions, this article focuses on formal methods of lawyer regulation. Jurisdictions vary significantly with respect to whether regulation occurs on a national or subnational basis, the types of entities that engage in lawyer regulation, the methods of regulation they use, their sources of authority, and the number of regulatory layers that exists.

In a few jurisdictions, such as those in the United States, the primary source of lawyer regulation comes from the judicial branch of government, rather than a legislative act. Because US lawyers primarily are regulated on a subnational basis, it is the highest court in each US state that holds primarily responsible for regulating lawyers (Green and Zacharias, 2009). In many jurisdictions, however, an overarching legislative act establishes a regulatory framework, with a secondary level of regulation provided by a frontline regulator that issues its own regulations. In some jurisdictions, such as Canada, Japan, and others, these frontline regulators may be law societies or bar associations in which practicing lawyers participate. In other jurisdictions, such as the SRA in England and Wales, there is a coregulatory system in which oversight is assigned to bodies that might have limited lawyer participation. The resources listed in the final section include entities that have aggregated information about the identity of lawyer regulators.

Currently, one of the main differences among lawyer regulators is the degree to which they use a principles-based system of lawyer regulation, as opposed to a rules-based system. For example, the U.K. SRA has adopted an outcomes-focused regulatory approach that relies on principles, rather than rules (U.K. SRA, Outcomes Focused Regulation). To the extent that a jurisdiction uses this approach, it may use fewer of the regulatory instruments that are described in the subsequent paragraphs, or it may have less detailed regulatory instruments. Another important difference in regulatory methods is the extent to which a regulator relies on ex ante versus ex post regulation of lawyers (Terry et al., 2012a). New South Wales, Australia's ex ante approach to lawyer regulation undoubtedly has received the most publicity (Parker et al., 2010).

Jurisdictions use many different types of regulatory instruments, and not all jurisdictions use all regulatory instruments (Terry et al., 2012a). As noted, lawyer regulation sometimes is found in legislation. This legislation may be profession specific, such as the legal profession acts found in Canada, Australia, or Germany. Additionally or alternatively, legislation applicable to lawyers may be found in legislative codes that have a broader application, such as bankruptcy statutes, criminal statutes directed against money laundering, or criminal statutes that require lawyer confidentiality. Examples of the first kind of legislation include the US bankruptcy rules applicable to lawyers counseling debtors; examples of the second kind of legislation are the UK rules on money laundering, and examples of the third kind are German laws requiring lawyer confidentiality (Hellwig, 2009; Leubsdorf, 2009; Terry, 2008a).

Regulations constitute a second type of regulatory instrument; they often are adopted pursuant to a legislative delegation of power. For example, in Germany, the regulatory bar association called the *Bundesrechtsanwaltskammer* (Federal Bar Association) has adopted binding regulations (the *Berufsordnung*) for the legal profession (*Rechstanwälte*) pursuant to the authority granted to it by federal legislation known as *Bundesrechtsanwaltsordnung* or BRAO (Terry et al., 2012a). The US Securities and Exchange Commission has adopted regulations applicable to lawyers pursuant to the authority granted to it by the US Congress under the Sarbanes-Oxley law (Leubsdorf, 2009).

A third source of lawyer regulation are lawyer conduct rules or principles, which sometimes are known as ethics rules, ethical principles, codes of conduct, rules of professional responsibility, or rules of professional conduct. In some cases, the primary regulatory authority, such as a US state supreme court, will adopt these codes of conduct. In other cases, several

levels of delegation may be involved before one reaches the entity responsible for adopting these types of provisions. For example, the 2007 U.K. Legal Services Act (U.K. Act) created the LSB, which has approved the SRA as a frontline regulator for solicitors in England and Wales. In 2011, the SRA adopted a new *Handbook for Solicitors*; this handbook includes a Code of Conduct that took effect on 6 October 2011 and that uses outcomes-focused or principles-based system of regulation.

A fourth instrument of lawyer regulation comes in the form of guidelines, guidance, comments, or commentary, which may or may not be binding. For example, the Law Society of Upper Canada has included 'commentary' in its Code of Conduct, and a number of US jurisdictions have adopted the comments to the ABA Model Rules of Professional Conduct and treat them as interpretative tools. Conversely, other US states have refused to officially adopt the Comments although they might reprint them (ABA CPR State Adoption of Comments, Law Society of Upper Canada Rules of Professional Conduct). Not all jurisdictions will use this regulatory instrument.

A fifth type of regulation can come in the form of regulations applicable to the entity that regulates the legal profession. For example, a law society or regulator might be subject to bylaws or other limitations, in addition to the legislation that created the entity. The Law Society of Upper Canada, for example, must comply with both its bylaws and the Ontario Legal Profession Act that created the Law Society (Terry et al., 2012a).

A sixth source of regulation is the jurisdiction's constitution, treaty, or foundational documents. Lawyer regulations (of any sort) that are inconsistent with the jurisdiction's foundational law may be struck down. This has happened in the United States and in the European Union (ABA Lawyer Advertising Cases; CCBE Judgments; Knake, 2010).

Of these six sources of regulation, the ethics code of a particular jurisdiction may be the most visible and most often the subject of discussion and comparison (ILEC Conferences, IBA Regulation webpage.) But when researching lawyer regulation, be sure to look for all of these different sources of regulation, even though not all instruments will be used in all jurisdictions.

As a final observation on the sources and methods of lawyer regulation, it is worth noting that it is common to hear lawyers around the world describe themselves as members of a self-regulated profession and to have academic professionals comment on this phenomenon (Rhode and Woolley, 2012; Zacharias, 2009; Ziv, 2009). Despite this rhetoric, there are few if any countries in which lawyers are completely self-regulated without any oversight, direction, or limits from other sources, such as the executive, legislative, or judicial branches of government. Nor is there necessarily any shared cross-cultural understanding of what is meant by the term 'self-regulation' (Terry et al., 2012a). Thus, when claims of lawyer 'self-regulation' are made, they should be examined to determine exactly what is meant.

Changes in Focus and Emphasis over Time

There has been a change in the focus and emphasis of lawyer regulation over time. Scholars also have called for increased attention to the organizational contexts in which lawyers practice, and the effects of organizational structure and culture on lawyers' individual conduct (Chambliss, 2000, 2006; Evans et al., 2008; Galanter and Palay, 1991; Galanter and Henderson, 2008; Nelson, 1988; Wilkins, 1998). Given that lawyers increasingly practice and are socialized within firms, both regulators and scholars have begun to focus on how such firms are managed and what firm-level regulatory controls, if any, should be required (Schneyer, 1991). The emergence of new organizational forms, such as multinational and multidisciplinary partnerships and alternative business structures (ABS), has only underscored the interest in developing a strategy for firm-level or 'entity' regulation (Chambliss, 2000; Chambliss and Wilkins, 2003).

Although regulation in many jurisdictions is still limited to the regulation of 'lawyers' (i.e., individuals), there has been a marked increase in the number of regulators that focus on regulation of the *entity* within which the lawyer works. For example, although entity disciplinary regulation generally is not available in the United States, other than through the liability system, New York and New Jersey have the authority to discipline law firms as well as individual lawyers. Several Canadian provinces authorize discipline of law firms, and other provinces are considering this concept. In several Australian states, if a lawyer chooses to practice in the form of an incorporated legal practice, that entity is subject to additional regulation. The most dramatic change is the adoption of an entity-based system of lawyer regulation by the U.K. SRA (Terry et al., 2012a).

In addition to the increased interest in entity regulation, there has been a change over time about the topics that seem to be the subject of lawyer regulation, particularly in those regulatory instruments that govern the middle time period and that often are referred to as 'legal ethics codes.' As exemplified by the ABA Canons of Professional Ethics and the CCBE Declaration of Perugia, it was common for older codes of ethics to be written as aspirational documents, rather than regulatory documents intended for enforcement (Schneyer, 2008; Terry, 1993). Many older ethics codes contained provisions that now are considered to involve matters of etiquette or that were self-protectionist or simply were platitudes. Although some of these provisions still remain, the current codes of conduct are much more likely to have provisions that are intended to be enforced as regulatory provisions. Most current sources of lawyer regulation will have rules governing lawyer competence, confidentiality, conflicts of interest, and perhaps additional issues, such as fees or advertising.

Although only a small fraction of all lawyers practice in large, global firms, transnational practice is one of the fastest growing sectors in the legal services market (Abel, 1994; Aronson, 2007; Cone, 1996; Dezalay and Garth, 1996; Flood, 1996; Silver et al., 2009; Terry, 2008b; Trubek et al., 1994; WTO, 1998, 2010). This rapid growth of transnational practice has put pressure on regulators to 'recognize' the qualifications of foreign lawyers and grant them practice rights (ABA, Section on Legal Education and Admissions to the Bar, Special Report, 2009). In general, however, local regulation has not kept pace with market demands (Flood, 2012). Although some jurisdictions have relaxed restrictions on foreign lawyers in recent years, many continue to impose

significant barriers to cross-border practice, and there continues to be significant jurisdictional variation (WTO, 1998, 2010). Lawyers have responded to the complexities of local regulation in part by noncompliance with the rules (Abel, 1994; Krishnan, 2010), and many scholars and regulators urge deregulation or more appropriate regulation (Goebel, 2000; Silver, 2003). In the coming years, this promises to be an important arena for regulatory reform.

Given the growth in transnational legal practice, there also has been a growing recognition of the need for lawyers from different jurisdictions to have a shared set of ethical rules when interacting with one another (Hellwig, 2009). The CCBE developed a Code of Conduct that applies to activities or individuals who cross EU borders (Terry, 1993). The IBA issued its General Principles of the Legal Profession in 2006. The International Law Association adopted in 2010 The Hague Principles on Ethical Standards for Counsel Appearing before International Courts and Tribunals in an effort to have lawyers from different cultures who appear before international courts and tribunals use the same rules. These represent an effort to identify principles in common (or to establish an agreed-upon approach in which it is impossible to identify principles in common). These cross-cultural conversations about lawyer regulation are likely to continue in the future (Terry, 2005).

The inclusion of services, including legal services, in the WTO's General Agreement on Trade in Services (GATS) has greatly expanded the universe of those interested in lawyer regulation. The GATS took effect in 1995 and was the first time that services, as opposed to goods, were included in a global trade agreement. The WTO has more than 155 member states, and the GATS meant that governments needed to decide what additional commitments, if any, they were willing to make with respect to their regulation of foreign lawyers. One consequence of the GATS is that it changed the way in which legal services are discussed. A standard terminology now is used to describe the methods by which legal services are delivered (i.e., GATS Modes 1–4) (Terry, 2010). There is also more standardization in the vocabulary used to describe the regulation of lawyers 'foreign' to one's jurisdiction (host jurisdiction, home jurisdiction; fly-in, fly-out (or FIFO); foreign legal consultants (FLCs); limited licenses; association rights; and skills transfer). This growing shared vocabulary has been useful in the efforts of entities, such as the WTO, APEC, and the IBA, to aggregate data about lawyer regulatory policies (Terry, 2010, 2013; WTO Report, 2010; APEC Legal Services Inventory, the forthcoming IBA Survey).

Another change in lawyer regulation is the increased interest by government antitrust (competition) authorities in the content of lawyer regulation. The US Supreme Court has struck down advertising bans and minimum fee schedules as violative of the antitrust laws. The European Court of Justice has considered antitrust challenges to fee schedules, and rules limiting the business forms in which lawyers may operate. The Organization for Economic Cooperation and Development, the European Commission, and the Australian, UK, and Canadian Competition authorities, among others, have issued reports about competition in the legal profession. These competition reports focus on topics that include lawyer regulatory provisions limiting advertising, setting minimum fees, evaluating whether entry into the profession is too restrictive, discussing the scope of the lawyers' monopoly or reserved activities, and setting rules limiting the business structures in which lawyers may operate (Terry, 2009). Some significant regulatory reforms have followed these reports.

Two recent changes in lawyer regulation may have a dramatic impact on lawyer regulation throughout the world. In 2007, the Australian law firm Slater and Gordon became the first law firm to be publicly traded on a stock exchange. In 2012, the U.K. SRA began issuing ABS licenses, which allow outside investment and ownership of law firms. The latter development is especially likely to be influential because of the number of law firms located in London and the number of countries in which London-based firms are located (Terry, 2013).

The 2007 UK changes were the result of a process that began with the U.K. Office of Fair Trading and culminated in the 2007 Legal Services Act, which dramatically reshaped lawyer regulation in the United Kingdom; one of the goals of the UK revisions was to increase access to justice by making legal services more accessible. One noteworthy aspect of the UK changes is the increased analysis of lawyer regulation from those who are 'outside' the traditional lawyer regulatory community (Black, 2010; Decker and Yarrow, 2010; U.K. Legal Services Board, Research). This phenomenon also has occurred outside the United Kingdom (Hadfield, 2008; Ribstein, 1998).

Globalization and technology, along with this increased competition focus, have created pressures on lawyer regulatory systems around the world (ABA Commission on Ethics 20/20; Gillers, 2012). Questions have been raised about the 'who-what-when-where-why-and-how' of lawyer regulation (Terry et al., 2012a). Should lawyer regulation reside primarily with the profession or should it be part of a coregulatory system, or should it be something else entirely (Hadfield, 2008; Rhode and Woolley, 2012)? Who or what should be the object of regulation: legal services or providers? Should regulators try to develop an ex ante system of lawyer regulation that encourages or requires lawyers to take proactive actions, such as continuing education or self-assessments as a way of preventing client mistakes? There is great interest in this issue in light of research showing a one-third reduction in client complaints after imposition of Australia's ex ante system of lawyer regulation (Parker et al., 2010). Where should regulation occur in an era in which law is practiced both transnationally and virtually, but regulation is tied to geographic political entities (Flood, 2011)? What should be the regulatory objectives of lawyer regulation (Terry et al., 2012b)? Finally, what methods should be used to achieve the desired regulatory goals and minimize unintended consequences (Regan et al., 2008; Rhode and Woolley, 2012)? Some believe that the next 20 years are likely to see greater transformation in how the world's legal professions are organized and ply their services than was true for any comparable period in history (Gillers, 2012).

Current and Emerging Directions in Theory and Research

By examining lawyer regulation resources and recurring academic conferences, one can identify current and emerging

schools of thought and directions in scholarly research. As noted earlier, the first ILEC took place in 2004 in England. The most recent ILEC conference was the ILEC V, held in 2012 in Banff, Canada. Banff presenters were asked to identify which of four 'streams' their presentation was suited for: Culture, Ethics, and Society; Empirical Approaches to Legal Ethics; Philosophy and Legal Ethics; or Regulation of the Profession(s)/Ethics and Education (see http://www.ucalgary.ca/ilec5/ilec_streams).

In the United States, those interested in lawyer regulation often must choose between two different conferences that are held annually at similar times. The ABA Center for Professional Responsibility hosts an annual National Conference on Professional Responsibility, which usually is attended by US and Canadian academics, regulators, and practicing lawyers and tends to focus on North American doctrinal developments and risk management. The Law and Society Association, an international scholarly association based in the United States, also holds annual conferences, often at a similar time. For a number of years, there have been coordinated panels on legal services and lawyers at the annual Law and Society Association Conference. The 2012 conference had panel sessions on a wide range of topics related to lawyers and judges. Although others have held periodic conferences devoted to various lawyer regulation topics, no other jurisdiction or entity seems to have annual conferences devoted to lawyer regulation.

Some of the leading specialty journals include the *Georgetown Journal of Legal Ethics* and the *Journal of the Professional Lawyer* in the United States and the peer-reviewed UK journals entitled *Legal Ethics* and the *International Journal of the Legal Profession*. A number of US institutions have centers that focus on the legal profession and those institutions have hosted conferences that focus on the legal profession (e.g., Harvard, Georgetown, Stanford, Fordham, Hofstra, Michigan State, South Texas, and Akron). As noted earlier, there have now been five International Conferences on Legal Ethics. The presentations and papers from these conferences usually are available online and sometimes are published in Symposium issues (Symposium, 1996). Some academic institutions have published papers from practitioner-oriented conferences on lawyer regulation (Terry, 2008c). These resources are among the most efficient way to locate leading academics and current and emerging directions in theory and research.

Methodological Problems

One of the methodological problems facing researchers and stakeholders is the difficulty in locating and sharing information about lawyer regulation in other countries. A second methodological problem is the difficulty one has in making cross-cultural or cross-professional comparisons given the definitional issues noted earlier. A third methodological problem is access to the data necessary to conduct empirical work (Silver, 2010;Chambliss, 2012). There have been some excellent qualitative and quantitative studies and some useful collaborations among scholars and regulators (American Bar Foundation After the J.D. Publications; Fortney, 1996, 2009; Parker and Aitken, 2011; Parker et al., 2010; Parker et al., 2009; Parker and Haller, 2010; Regan, 2004; Sommerlad et al., 2010). Nevertheless, many academics lack access to data that would allow them to engage in critical empirical analysis.

Links to Databases and Software

In addition to the domestic sources and authors, several resources aggregate useful information about the regulation of lawyers. The number of these resources seems to be growing.

With respect to US lawyer regulation, information about US admissions regulators is found on the webpage of the NCBE and the ABA Section of Legal Education Admissions to the Bar. Extensive information about US state ethics rules, including the degree to which a state has varied from the ABA Model Rules of Professional Conduct, has been aggregated on the Policy Implementation webpage of the ABA Center for Professional Responsibility. Information about US lawyer discipline is found on the webpages of the NOBC and the ABA Center for Professional Responsibility Standing Committee on Professional Discipline. The American Law Institute has issued a Restatement of the Law Governing Lawyers, which is exceptionally helpful to those studying the regulation of lawyers.

The FLSC aggregates regulatory information for Canada. Its website includes information about model FLSC policies, and includes links to provincial and territorial law societies and their regulatory provisions.

The CCBE maintains an active website with extensive material about lawyer regulation in Europe. When examining an issue or before preparing a position paper, the CCBE often will survey its members about lawyer regulation in their jurisdiction with respect to a particular issue. Most of these CCBE surveys and position papers may be accessed through the relevant link on the CCBE Committees webpage. The CCBE Discipline Committee webpage has links to a list of disciplinary contact points in CCBE member states and a summary of each jurisdiction's disciplinary process and to another page that summarizes European Court of Justice cases related to lawyer regulation. The CCBE Deontology Committee webpage includes links to national codes of conduct and to reports summarizing EU privilege and confidentiality rules and to the 2004 Fish Report on EU Member State Treatment of In-house Counsel.

The Law Council of Australia describes itself as the "peak national representative body of the Australian legal profession." In addition to the individual legal practitioners it represents, the Law Council has 'constituent members' that include the state and territorial bar associations and law societies. Its website collects information on lawyer regulatory policies. Additional information about lawyer regulatory policies is available on the CORO website, which is an umbrella organization of lawyer regulators in Australia and New Zealand.

It is increasingly common to have international or regional entities collect lawyer regulation information from different countries. The WTO currently consists of more than 155 members with broad geographic representation. The WTO website allows one to go online to determine whether a particular WTO member made legal services 'commitments.' If it has,

then that country may have lawyer regulation that is more liberal than its commitments, but it may not have regulation of foreign providers that is less liberal than its legal services commitments (Terry, 2010). These WTO Schedules can provide useful starting data about lawyer regulation (WTO Services Database).

The Legal Services Initiative of the APEC collected lawyer regulatory information from many of the APEC member economies and posted it online. Its webpage includes both a high-level overview and detailed jurisdictional information, including contact information for lawyer regulators.

The Bar Issues Commission of the IBA has begun posting links to the legal ethics codes and other rules on its webpage entitled 'IBA, Documents on the Regulation of the Legal Profession.' (The IBA has more than 200 bar association members and wide geographic representation.) The IBA also has published a useful book on privilege and confidentiality (Greenwald and Russenberger, 2012). Its Anti-Money Laundering Forum summarizes money-laundering legislation applicable to lawyers International Bar Association. Anti-Money Laundering Forum. The IBA's 2013 release of the results of a report it commissioned on lawyer regulation should be available online.

Several additional resources are worth noting. The U.K. LSB, which was created as part of the 2007 U.K. Legal Services Act, has commissioned a number of research reports that sometimes include useful comparative information on lawyer regulation. The consultations issued by the SRA also have useful information U.K. Solicitors Regulation Authority, Consultations. In September 2012, the SRA sponsored the first International Conference of Legal Regulators; the materials from this conference are posted online and include a Directory of information about the regulatory system provided by that country's regulators. The second meeting of this group will take place in San Francisco, California, in August 2013. In other fields, such as antitrust, securities, and labor, international networks or regulators have served as a useful source of information (Terry, 2012). The ABA Guide to International Bar Admissions (Dombrow and Matos, 2012) includes useful information on lawyer regulation. Finally, the IBA has commissioned a survey of lawyer regulation. If this IBA survey is completed and posted online, it will be a useful resource regarding lawyer regulation.

Abstract

The social organization of the legal profession varies from country to country and across systems of law. Although the majority of lawyers work in private practice, many lawyers work in other settings such as government, corporations, education, and law clinics. In recent years, dramatic changes have taken place, including a tremendous growth in the size of the legal profession and increasing demographic diversity. The nature of legal work has also changed, with a smaller proportion of lawyers working independently and more lawyers employed in law firms and other organizations. A rise in corporate legal work has led to the growth of large law firms with branch and international offices. These changes present new challenges for professional ethics, protection of jurisdictions, and self-regulation of the legal profession.

The social organization of the legal profession assumes distinct forms across various systems of law, across nations, and even within nations. From jurisdiction to jurisdiction, the profession is organized differently according to titles and roles, education and training requirements, and the settings in which legal professionals work. Yet across jurisdictions, members of the legal profession, as the experts of law, play a central role in facilitating the aims of law in terms of social integration, regulation of behavior, and social change.

The legal profession shares several core elements with other professions (such as medicine, accounting, and engineering). The first is that lawyers are holders of expert knowledge. This body of knowledge is composed partly of formal, abstract principles (Abbott, 1988). Their training equips lawyers to interpret the law and to facilitate various transactions, from business contracts to intellectual property rights, and from criminal prosecutions to estates planning. The control over a body of knowledge leads legal professionals to enjoy a comparatively high level of technical autonomy in their work. This is reflected in the relative independence of lawyers' work objectives from larger organizational imperatives. This autonomy is also seen in systems of self-regulation, governance and licensing, and in admission requirements of the legal profession. Another hallmark of professions is a normative orientation toward the service of others. This service orientation is often instilled in law schools, where students volunteer hours at legal clinics and then continue in their professional life efforts to ensure access to justice, including helping those in need through pro bono (e.g., free and voluntary) legal services. A final characteristic of law as a profession concerns status: lawyers are typically of high status in society and are well remunerated (Goode, 1961).

In recent years, dramatic changes have taken place in the world of law practice, changes that challenge this traditional model of the profession. The legal profession has grown exponentially in size over the last 30 years. There has also been a tremendous rise in very large law firms handling corporate legal work. The nature of that work is increasingly transnational, with many big firms operating branch and overseas offices. Within firms, work is increasingly structured by departments and subdivided into specializations of fields of law. Moreover, one has seen alternative career tracks emerge, supplementing or supplanting the 'up or out' conventional promotion model of law firms. These changes have impacted significantly the social organization of the legal profession, leading to greater fragmentation and intensification of hierarchy within the profession. As a result, the hallmark characteristics of law as a profession are also undergoing a transformation. This article reviews research on the changing social organization of the legal profession with respect to work roles, education and training, sectors within the profession, career paths, demographic change, and contemporary challenges facing the legal profession.

Systems of Law, Professional Roles, and Titles

Differences in the legal profession, specifically with reference to education and core knowledge, are largely based in a country's system of law. Civil law systems are characterized by a vast network of codified laws; one example is France, where Napoleon introduced a national code in 1804 (other civil law-based countries include Spain, Italy, Germany, Brazil, Turkey, Mexico, Chili, and Venezuela) (Deflem, 2008; Pérez-Perdomo, 2006). Common law countries (e.g., Ireland, the United States, the United Kingdom, South Africa, and Australia) typically draw on the British legal system and rely heavily on case law, based on precedent established through earlier court decisions. In some countries, hybrid models of law exist. In Canada, for example, a history of colonization by England and France resulted in civil and common law systems infusing different regions of the country. Even in countries where a single system of law exists, there is increasingly an infusion of the other system; jurisprudence is becoming more relevant in civil law countries, and common law countries are experiencing increasing levels of codification. Nevertheless, these two systems of law persist in terms of legal education: civil law tradition law schools encourage the study of codes and statutes, while common law tradition law schools emphasize analysis of court cases (Deflem, 2008). Other combinations also exist, such as countries with religious laws (e.g., Saudi Arabia, Sudan, and Yemen based on Islamic law)

and pluralist models (e.g., Egypt, Syria, and Morocco with Islamic law and civil law, and Nigeria and Pakistan with English common law and some Islamic law applied).

The titles and roles of legal professionals also appear differently in common and civil law nations. In Great Britain, a distinction exists between solicitors and barristers. Solicitors are legal advisors to clients, while barristers, the smaller and more elite professional group, are trial lawyers in court. Some common law countries, notably the United States and Canada, do not make a distinction between solicitor and barrister. In these countries, lawyers operate as barristers and solicitors, although they may classify their work as primarily that of a solicitor or as a barrister or litigator. Notaries exist as a separate occupation, although in restricted numbers, without the requirement of a law degree, and their responsibilities are largely limited to administering oaths and attesting documents (Brockman, 1999).

There are further variations in the words used to describe lawyers. For example, the term 'attorney' is more commonly used in the United States than in Canada to refer to a lawyer or litigator. In civil law countries, variations in titles and roles take a different form. In contemporary France, *avocet* encompasses *avoué* (pleading cases in court), *conseil juridique* (legal advisor in business), and solicitor work (e.g., administrative law, wills and estates, and real estate). Meanwhile, in the province of Quebec, Canada, following the French civil law tradition, the *avocat(e)* and *notaire* represent two distinct traditions of law practice. Both professional groups attend law school (*notaires* for an additional year to earn a diploma in notarial law). *Notaires* may express opinions in all areas of law. However, unlike *avocats*, *notaires* are public officials, required to exercise neutrality and provide advice to all parties. The system of exclusive jurisdictions in Quebec specifies that *notaries* traditionally practice in the areas of real estate, wills and estates, marriages and family mediation (Kay, 2009); litigation (criminal law, civil litigation, divorce, and so on) and advocacy are the realm of *avocats*, and only *avocats* can be appointed judges (Kay and Brockman, 2000).

Education, Licensing, and Practice Settings

Educational training of legal professionals also varies across countries. Historically, legal professionals trained through a system of apprenticeship in law offices. Over the last century, university law programs became the primary platform for educating students of law. In many countries, law can be studied as an academic discipline in college or university, following secondary schooling (e.g., Spain, Italy, and Portugal), while in other countries (e.g., the United States and Canada) a college degree is normally required prior to entrance to professional law schools offering a JD (Juris Doctor) or LLB (Bachelor of Laws) degree. Many countries require an apprenticeship period after law school. In civil law regions such as France and Quebec, Canada, this training period includes practical professional training at an *École Barreau* and supervision in a law practice setting. Some common law countries (e.g., Canada, the United Kingdom, and Ireland) require a similar period that lasts several months, followed by a bar admissions examination (Kay, 2009). After admission to the bar (or 'swearing in' ceremonies, as is the case with English solicitors and French *notaires*), law graduates embark on careers across a broad array of work settings.

The majority of law graduates enter private practice, working in law firms with other lawyers or on their own as solo practitioners. In the United States, 75% of lawyers work in private practice. About half of these lawyers work as solo practitioners and half in firms, with the majority of lawyers employed in smaller firm sizes (20% of lawyers work in firms of 10 or fewer lawyers, 18% in firms between 11 and 50 lawyers, and 20% in firms larger than 50 lawyers) (ABA, 2012). Although research focuses on large law firms, the reality is most law firms in the United States consist of just 2–5 lawyers (76%), followed by firms of 6–10 lawyers (13%). Only 11% of law firms are composed of more than 10 lawyers. And while the majority of law graduates work in private practice, sizeable numbers work in government (8%), private industry (8%), the judiciary (3%), education (1%), legal aid/public defenders (1%), and private associations (1%) (ABA, 2012).

The Core of the Profession: Private Practice

The Two Hemispheres Thesis

The legal profession is frequently depicted as bifurcated, divided between more elite, highly remunerated lawyers serving wealthy corporate clients and general practitioners, who are less handsomely paid, work in smaller offices, and serve individual clients. For example, in their classic study of Chicago lawyers, Heinz and Laumann (1982) demarcated two kinds of law practice: elite lawyers who represent large corporations and those who represent individuals. Lawyers within each sector differed systematically in terms of the prestige of law schools they attended, career histories, likelihood of engaging in litigation, forums of litigation, social and political values, and social networks (Heinz and Laumann, 1982). The organizational differences within the hemispheres shaped professional opportunities and remuneration.

Twenty years later, Heinz and colleagues returned to study Chicago's bar, comparing 1975 and 1995 cross-sectional surveys of the city's lawyers. In their book, *Urban Lawyers: The New Social Structure of the Bar* (2005), Heinz et al. revealed that the contemporary organization of work is subdivided into smaller, more highly specialized clusters that are less visibly separated by the distinction between corporate and personal client types. Furthermore, they observed a shift from client-based to transaction-based work groups within private practice. They also challenged the idea of hemispheres, particularly the notion of a globe spliced into equal halves. They observed that increasing differentiation of lawyers' roles over the 20 years has resulted in fortified internal boundaries that are 'more well-defined and difficult to cross' (Heinz et al., 2005: p. 317). The hemispheres themselves also changed. Work for corporate clients has become a much larger part of the profession than work for individuals or small businesses. Fields are now more distinct, more clearly separated. Specialization has increased markedly in most fields, especially in the corporate sector. The incomes of partners and associates in major law firms have become lucrative,

while the earnings of lawyers working in solo practices, small firms, and government employment have declined (Heinz et al., 2005).

Upward Mobility: The Partnership Tournament of Law Firms

Not only has the overall structure of the legal profession changed in recent decades, but mobility routes within the profession have also changed. This is particularly the case in law firms. By the 1960s, most elite law firms in the United States adopted a structure pioneered by Cravath, Swaine, and Moore decades earlier. The 'Cravath system' divided firms into two groups: associates, who came directly from law school (or judicial clerkship) and received an annual salary, and partners, who were more experienced lawyers and shared in the profits of the firm (Milton, 2006). The more senior lawyers had more work than they could manage and therefore recruited highly qualified but inexperienced graduates to work on the firm's cases under the supervision of senior lawyers. After an extended probationary period of typically 5–8 years, marked by increasing responsibility, the most proficient associates would be invited into the partnership (the ownership circle of the firm). Associates outnumbered partners and only a select few would advance to the partnership. Those not offered partnership would leave, to be replaced by new recruits. This competition provided incentives for young lawyers to work long hours and for older lawyers to train new recruits without fear they would leave and take clients with them. This model was widely adopted in the United States and became a model embraced in many countries (Henderson and Galanter, 2008).

The ratio of associates to partners, known as 'leverage,' became an important predictor of a firm's profitability. Rising numbers of salaried associates often resulted in enhanced financial returns for partners (Bruck and Canter, 2008). But beginning in the 1960s, law firms began to transform. Businesses faced increasing government regulation through employment law, civil rights, intellectual property, product liability, and antitrust and corporate contracts (Galanter and Palay, 1991). There was an unprecedented surge in demand for corporate legal services. In the 1970s, firms underwent further changes. Clients and lawyers both became more mobile. Firms became more commercial and market oriented, embracing marketing and professional management (Henderson and Galanter, 2008). Starting in 2000, the tournament shifted again. The traditional up-or-out principle was liberalized to include retention of 'permanent associates' and appointment of salaried or nonequity partners (Gorman, 1999). There emerged a class of nontournament lawyers, such as counsel, staff lawyers, staff associates, contract lawyers, and lawyers at outsourced locations. Partners in major law firms, formerly treated as having life tenure, were now sometimes expelled from the partnership. Replacements were recruited from other firms and clients' loyalty extended to lawyers rather than to firms (Coates et al., 2011; Henderson and Bierman, 2009; Heinz et al., 2001). Henderson and Galanter (2008) refer to this new universe as the 'elastic tournament,' because it involves a stretching of the tournament to include partners who work longer hours, accept unequal financial shares, fear losing their share of firm profits, and worry about being pushed to retire early.

Contemporary Changes: From Golden Era to Global Reach

The mid-twentieth century is often depicted as the 'golden age' of professional work. In this era, the earnings and social status of professionals (including lawyers) was much higher than almost all occupations (Gorman and Sandefur, 2011: p. 277). The 1970s and 1980s brought a period of transformative changes. There was a dramatic increase in the overall number of lawyers, and in the number of very large law firms dealing with corporate legal work. There were also fluctuations that occurred in tandem with economic cycles. For example, when the economy stalled in the 1990s, corporate law firms reduced the hiring of new lawyers and many firms terminated excess lawyers (Heinz et al., 2001). The growth of corporate sector practice and the decline in the amount of personal and small business legal work was paralleled by a corresponding realignment of the organizational contexts in which lawyers work. Legal work became increasingly dominated by large organizations as employers of lawyers – these employers included large law firms, corporations, and government. Solo practitioners, once the majority in private practice (64% of all lawyers in the United States worked as solo practitioners in 1960) (Heinz et al., 1998), now represent slightly less than half of private practitioners (ABF, 2012).

Several areas of law practice flourished during the 1980s and 1990s. New specialties gained prominence, such as sports, entertainment, cyber, and health law. Changes in legislation regulating business activity generated commercial legal demands. Welfare legislation, environmental protection, land rights, and antidiscrimination laws further increased demand for legal services (Anleu, 1992). Alongside this growth in substantive areas of law, new types of practice such as legal aid and community legal centers emerged (Weisbrot, 1985).

Another major change was the system of billing clients. Fixed fee schedules gave way to a system of hourly billing, and prohibitions on advertising were eroded in several countries (including Australia and the United States, for example) (Anleu, 1992). The expectations for annual billable hours by lawyers working in law firms rose dramatically in the 1990s (Fourtney, 2005; Richmond, 2000), with a decline after 2007, likely due to the slowdown in the legal economy starting in 2008. Billable hours appear to be on the rise again (NALP, 2012).

During this period, law firms grew dramatically in size and developed distinct practice areas (Nelson, 1988). Departments emerged, defined by substantive expertise such as tax, litigation, real estate, and mergers and acquisitions. Typically, within departments, work was allocated by managers, often assisted by a second level of supervisors (Flood, 2011; Heinz et al., 1998). During the last two decades, large law firms have become increasingly corporatized with the inclusion of human resources, marketing directors, public relations, risk analysis and compliance counsel, finance, and technology departments (Henderson and Galanter, 2008).

These shifts are often described as signaling a trend toward commercialization and 'bureaucratization of the bar' (Heinz et al., 1998: p. 770). Law firms increasingly make use of alternative business structures and management systems for ensuring provision of legal services in compliance with

professional ethical obligations (Parker et al., 2010). As a consequence, autonomy at the organizational level remains considerable, while autonomy for individual lawyers has declined (Gorman and Sandefur, 2011). Some scholars have expressed concern that the changes are evidence of a loss of control over work goals, content, and performance (Abel, 1986). Meanwhile, other scholars find little evidence of managerial priorities subsuming professional ones. Ackroyd and Muzio (2007: p. 731), for example, claim that changes in law firms in England and Wales remain focused on a 'refurbishment' of professional ideals. In a similar vein, Faulconbridge and Muzio (2008) contend that law is undergoing a new form of professionalism, one they term 'organizational professionalism,' whereby traditional principles and objectives are secured through law firm organizational systems.

The massive growth and bureaucratization of large law firms has introduced new obstacles. The rise of large law firms, with broad geographic platforms and highly specialized and profitable practice groups and heavily bureaucratized corporate departments, challenges the task of maintaining shared cultural values and long-term vision (Henderson and Bierman, 2009). Massive growth has been accompanied by rising billable hour expectations, resistance of clients to pay for associate training, more lateral hiring, alarming levels of associate attrition, and a decline in firm culture and community. Under these conditions, law firms may exhibit remarkably little initiative to pursue noneconomic objectives, such as racial and gender diversity or the training and mentoring of new lawyers (Henderson and Galanter, 2008). New challenges are emerging as an incoming generation of lawyers expresses dissatisfaction at the career paths offered within large law firms and clients protest rising billing rates (Nelman, 2010). These tensions may give rise to innovative new forms of legal service delivery. For example, Henderson and Bierman suggest that this dynamic "props open a door to a new wave of boutique and regional law firms with lower cost-structure and a more innovative, cooperative, and client-centric ethos" (2009: p. 1429).

Globalization and International Law Firms

Growth in firm size has in some ways been dwarfed by the emerging global reach of contemporary corporate law firms. While almost all law firms were once locally based, by the 1980s and 1990s it became common for law firms to have offices in several major cities in the United States and abroad (Segal-Horn and Dean, 2011). With ongoing investment of American and British capital into previously untapped markets (South America, Eastern Europe, and Asia, for example), globalization has created a host of new profit-making and client opportunities for those law firms from the United States and Britain that branch beyond domestic borders. There are now American and British law firms in Hong Kong, Shanghai, and Beijing, for example. Curiously in India, where multinational corporations and international accounting agencies and thousands of businesses from abroad actively operate, foreign law firms are barred from practicing (Krishnan, 2010). The emergence of large, often global, professional service firms poses a challenge for traditional professional regulatory regimes (Flood, 2011). Attempts by transnational law firms to import English and American understandings of legal practice to other institutional contexts have led to conflict, negotiation and adaptation, and hybridization in best practices (Faulconbridge et al., 2012).

Global law firms encounter even more complex challenges in China. Since 1992, the year the Chinese government formally permitted foreign law firms to establish representative offices in mainland China, more than 200 law firms have rushed to this lucrative market. The majority of these law firms come from the United States, Britain, France, Germany, Japan, and Australia. The two dominant global law firm clusters are headquartered and parented in the United States and the United Kingdom. However, foreign law firms are barred from practicing Chinese law and from employing licensed Chinese lawyers (Liu, 2008).

At the same time, the legal profession in China has undergone vast changes in recent years. Michelson (2007) highlights how depoliticization of the legal profession (through reform aimed at severing ties with government in the 1990s) resulted in lawyers flocking back to the official system in search of political protection. Some scholars critique a theory of market transition and emphasize the continued role of state-exercised power. For example, Liu (2008) coined the term 'the logic of fragmentation,' to describe the way five service fields related to the legal profession (rural dispute resolution, grassroots legal services, foreign-related legal services, corporate and government legal services, and criminal defense) compete with and intermingle with each other. Liu (2008) claims that state power guided these changes in the Chinese legal profession since reform. Other scholars identify recent powerful social changes that have shaped Chinese legal practice. For example, Xueyao and Jinhua (2013) document Chinese citizens' growing demands on the legal profession since the nation has experienced urbanization, the spread of higher education, and social modernization across fields. These changes have led to increased autonomy of the legal profession, a rise in the number of full-time lawyers, an expanding role played by lawyers in public life, a mounting volume of nonlitigatious cases that require specialization, and emerging differences in the organization of the profession across regions (Xueyao and Jinhua, 2013).

Broader Contours of the Profession

Many lawyers work in small firms or independently as solo practitioners. For most people, these are the lawyers they approach for legal matters. And while large law firms dominate in the urban core of big cities (and in the scholarship about legal profession trends), many sole practitioners and small firms have developed a vibrant clientele base in the suburbs surrounding cities (Seron, 1996). Some small firms exist as franchise law firms offering standardized services to a relatively low-income clientele (Van Hoy, 1997). Other lawyers set up their offices dedicated to particular areas of law, such as divorce and family law (Howieson, 2011). Lawyers also work in numerous contexts besides the standard private practice setting. For instance, today many large, complex organizations employ in-house legal counsel to

manage their legal affairs (Park et al., 2011). In addition, many lawyers work in government, in law clinics and legal aid services, and in international settings such as the World Trade Center or The Hague International Criminal Tribunal.

Demographic Diversity: Gender and Racial Minorities

For many years, the legal profession was composed of an exclusively male and largely majority racial group. As legal barriers to the entry of women fell in the late nineteenth and early twentieth centuries, a gradual trickle of women entered the profession, although access to certain realms of law practice remained restricted (Mossman, 2006). For example, in France, in the interwar years (1930s), women law graduates were denied access to the highly corporatist legal positions of notaries (*notaires*), solicitors (*avoués* and *agréés*), and court clerks (*greffiers*) (Fette, 2007). Changes in legal education facilitated increased demographic diversity in the profession. The move from an apprentice model to law schools in the early twentieth century in the United States, for example, enabled the training of more prospective lawyers. As law schools adopted more universalistic criteria, including standardized tests, access to legal education became more gender neutral. In addition, legal changes emanating from the civil rights movement of the 1960s mandated equal access to higher education for historically excluded groups. As a result, the legal profession came to reflect growing numbers of minorities and women.

Women's representation in the legal profession now far surpasses the small numbers of the 1970s; women have made inroads into all sectors of practice, including elite law firm partnerships, the judiciary, and governance of the bar (Kay and Gorman, 2008). Women represent 30% of the US legal profession (ABA, 2012) and make up 47% of US law graduates (ABA, 2013). However, a significant amount of gender inequality persists. Overall, women are more likely to be found in less remunerative and less prestigious practice settings. In the United States, for example, women are more likely to work in solo practice, government, education, legal aid, and law clinics. There also remains some gender imbalance across substantive practice areas. For instance, women remain underrepresented in law firms. Women are also vastly underrepresented among law firm partners (Kay and Gorman, 2008; Kay and Hagan, 1998). Outside of law firms, women appear to lag behind in senior-level positions in government, public-interest organizations, in-house corporate counsel offices, and in law schools (Hull and Nelson, 2000). Meanwhile, women are overrepresented among those leaving the practice of law (Kay, 1997). Gender inequality and women's attrition from law have been attributed to law firms' inflexible work arrangements and excessive time demands (Walsh, 2012) and to gender bias that limits women's career progress (Wallace and Kay, 2012).

Today's legal profession is also more diverse in terms of race and ethnicity – in 2010, 88% of US lawyers were white, nearly 5% African-Americans, less than 4% were Latino, and about 3% Asian-Americans (U.S. Census, 2010) – yet inequities persist. Racial minority groups are disproportionately concentrated in certain types of practices (Heinz et al., 1998). In the United States, for example, relative to whites, minorities are less likely to be made partners within firms (Chambliss and Uggen, 2000) and those who are invited to the partnership are more likely to be made nonequity partners (Wilkins, 1999). There is also evidence of a significant differential in earnings among law firm lawyers based on race (Ornstein, 2010). Race not only correlates with reduced promotions and lower incomes, but there is also evidence that racial minorities tend to have higher representation in firms with particular characteristics. For example, racial minorities are better represented in offices that are larger and affiliated with larger firms, offices of firms with higher revenues, offices with greater associate-partner leverage, and in branch offices rather than principal offices (Gorman and Kay, 2010).

Explanations for minorities' low rates of retention and promotions in law firms emphasize employers' conscious or unconscious bias rather than individual lawyers' choices and qualifications. Law firm partners may be less likely to select minorities in hiring and promotions due to cognitive bias favoring whites. The cognitive bias, often based on racial stereotypes or in-group favoritism, may lead organizational leaders to perceive minorities as less competent and to hold minorities to stricter standards in order to demonstrate their abilities (Wilkins and Gulati, 1996). This problem may be even greater for minority women. For example, in García-López's (2008) study, female Mexican-American lawyers perceived that their contributions were undervalued within firms and that they were assigned responsibilities beneath their capabilities. As a result, minority associates may be less likely to receive the developmental opportunities that are essential to acquire skills needed for success in law firms (Kay et al., 2009). This disadvantage may compound over time and across firm hierarchies (Kay and Gorman, 2012). As Wilkins (1999) demonstrated through his interviews with African-American partners at major law firms, African-American partners face obstacles in recruiting new clients, obtaining internal referrals for work from existing firm clients, and procuring the services of talented associates.

Consequences and Challenges for the Legal Profession

Professional Ethics and Regulation

The legal profession, similar to medicine and engineering, adheres to a model of self-regulation. Under this model, government has granted the professional community of lawyers a high degree of autonomy to organize their occupation in return for the profession's commitment to assure quality of services and to place public interest above their own (Flood, 2011). The legal profession has established means to inculcate ethical standards in their new members, including through formal professional education (e.g., law school and bar admission courses), apprenticeships, formal examination for admission to the bar, continuing legal education programs, and workplace socialization. Professional associations, such as bar associations and law societies, have established formal systems to monitor and discipline the behaviors of members through such sanctions as suspensions and disbarment.

Dramatic changes in the world of legal work in recent years may have eroded the efficacy of this model of self-regulation. Internally, the legal profession has become more fragmented and less cohesive. The growth in specialization within the profession means specialists in particular legal fields may identify more closely with their community of specialists than with the profession as a whole (Mather and Levin, 2012). Large corporate law firms have expanded globally to meet transnational demand and this global reach may mean lawyers working overseas experience weaker involvement in their local or national communities (Gorman, in press; Wilkins and Papa, 2013). Law firms have to comply with their headquarters' regulatory system and that of the host country where overseas offices are based. This creates a need for regulation that transcends borders (Flood, 2011). Furthermore, although large law firms and corporations that employ lawyers impose their own competing constraints on professional conduct, changing conditions of work threaten the traditional structures of law firms that foster a community of legal professionals necessary for informal monitoring and accountability (Gorman and Sandefur, 2011).

Jurisdictional Disputes and Professional Monopoly

The legal profession's market for services has grown in recent years with the expansion of global and corporate transactions. At the same time, established jurisdictions of the legal profession have been eroded by other groups providing legal advice, including accountants, realtors, managerial consultants, mediators, notary publics, and paralegals (Ackroyd and Muzio, 2007). Many tasks traditionally performed by lawyers are now assigned to paraprofessionals, such as paralegals. The relationship with these other occupations is at times complimentary (as is the case of paralegals employed by solo practitioners or law firms) and at other times, competitive (e.g., where paralegals provide a less costly alternative for legal services). In some countries, like Canada, paralegals have been absorbed into the organizational structure of law societies – the governing body of lawyers. Law societies now monitor educational standards, licensing, and discipline of paralegals and lawyers. Intraprofessional competition also occurs in mixed jurisdictions among legal professionals, as is the case in Quebec, Canada, where *notaries* and *avocats* compete to steer law reform, recruit law students, and expand jurisdictions of practice (Kay, 2009). Yet despite some encroachment on services by other professional groups and internal jurisdictional disputes, lawyers continue to maintain dominance as the experts of legal knowledge.

Today the legal profession remains a highly distinguished profession, one that is organized around rigorous educational requirements and professional training. Lawyers provide legal advice and representation, working across a diverse range of settings, including private practice, government service, private industry, legal clinics, education, judiciary, and corporate counsel. The legal profession has undergone vast changes in recent years in terms of a dramatic growth in numbers, increased demographic diversity, expanded corporate and transnational work, larger law firms, and changing career ladders. Nonetheless, the legal profession continues to enjoy considerable autonomy – to oversee education, accreditation, monitoring, and discipline of its members – as well as a resilient monopoly over legal services.

Abstract

Paul F. Lazarsfeld is best known for his contributions to methodology, in particular to the quantitative side. However, he possessed a much broader portfolio that enabled him to become one of the leading figures of social sciences in the decades after the end of WWII. His Viennese upbringing stocked him with cultural capital and his mingling in the Social Democratic movement of his hometown convinced him that the world could be made a better place, although this *weltanschauung* may later have shifted to changing the smaller world around him. His major impacts on social sciences of the second half of the twentieth century have been (1) the creation of research institutes devoted to empirical social research, funded by outside sources and offering students a training site; (2) inventing and refining techniques of data collection and analysis; and (3) enriching the usability and applicability of the sociological body of knowledge in the fields of socio-psychological consequences of long-term unemployment, mass media, and audience communication, and the then underdeveloped field of the sociology of social sciences.

Not all scholars possess the same type of academic portfolio, nor do they follow identical paths to become recognized and exhibit influence. Self-confident and humble inhabitants of the academic world pursue observable strategies – even hermits have one – to make their names and accomplishments known to others. Usually academics of all branches favor written communication, publish books or articles, or try to be present in person at as many professional gatherings as possible, exhibiting what even the vernacular now refers to by a sociological-sounding term: networking. In the past, only a minority explored alternatives to the traditional mode of communicating scholarly deeds. One twentieth century social scientist was particularly inventive in making his vision of social research known to others; his name is Paul Felix Lazarsfeld (PFL for short in the remaining text). He created institutions and invented a new label for his preferred version of research: 'empirical social research.' The establishment of stable patterns of collaboration allowed him to disseminate his vision of the craft to others by recruiting disciples to work on his ideas, and he was successful even in persuading people of equal status to join in such endeavors. A portrait of this "institution man," a label he proposed for people like himself (Lazarsfeld, 1969: 302), has to pay tribute to several facets of his performance and personality but should not sidestep the more conventional products, his writings. I will start with presenting PFL's core convictions with regard to the craft of social research, then discuss his methodological contributions, followed by an overview of his substantive work, and end with a gloss on his biography and the contexts in which he was able to develop all these accomplishments.

Lazarsfeld's Vision

At the core of PFL's convictions is the belief that the explication of what ordinary researchers do will help to improve future work in social sciences. He might have picked up the technique of *explication de texte*, or close reading, during his early visits to France, or perhaps his call for explication merely exhibits the pattern of multiple discoveries. In any case, this attitude became a characteristic element of his work habit and philosophy over a period of half a century. Something of a corollary to this is his understanding of the aims and merits of methodology: "I read somewhere a quotation from the English poet Wordsworth who said that poetry is emotion recollected in tranquility […] Since then I have always stressed that methodology is intuition reconstructed in tranquility" (Lazarsfeld to Hans Zeisel, 5 October 1967, as quoted in: Pasanella (1994): 22). Also he phrased his vision of the task of the methodologist elsewhere only slightly differently: "The sociologist studies man in society: the methodologist studies the sociologist at work" (Lazarsfeld, 1959: 171). Besides writing on methodology, he devoted even more energy to disseminating his insights and the findings to others, for which he used different paths and suggested even more than he used.

A consequence of his reconstructive methodological efforts was that PFL became aware of lacunae and shortcomings in the conduct of other social researchers, and to fill these gaps he regularly invented new techniques and encouraged others to do the same. Alongside the explicator we see therefore the constructor and individual who experimented regularly to improve the toolbox of social researchers. Disentangling these two sides is nearly impossible and not what is called for here, besides the fact that in looking at PFL one needs to be aware of both these sides of him.

Whether particular traits of a personality belong to the individual's self-image, or could be analyzed separately, or should be seen as the causal factor behind one's utterances do not need to be resolved here. But PFL's managerialism, activism, and restlessness – or what one could call a nearly permanent eagerness to join in and make suggestions – dramatically influenced his successes and also contributed to his failures. PFL always was a *homo politicus*, someone who wanted to intervene into the world around him and who probably devoted more energy to keeping his businesses running than to disengaging from the world at least temporarily to fine-tune a manuscript. At the same time, PFL was highly aware of the role of published words and regularly

pleaded with editors and publishers regarding his overdue submissions by proclaiming that he would not become famous for adhering to deadlines.

Lazarsfeld's Substantive Contributions to Social Research

As indicated, PFL's methodological work consists of three parts: first, inventions of new techniques; second, reconsiderations of the work done by others from the point of view of the implicit rules that made those works possible; and third, didactic means to help others to profit from predecessors.

It is easiest to start with the third point. At the age of 28, PFL published his first textbook *Statistisches Praktikum für Psychologen und Lehrer* (Lazarsfeld, 1929) which offered the students of psychology at the University of Vienna, Austria basic knowledge of statistics. In that work PFL explained simple features at some length, for example, how to transform absolute numbers into percentages and how to calculate a correlation coefficient. After migrating to New York, PFL contributed chapters to a textbook-like compendium for market researchers, *The Technique of Marketing Research* (1937), presenting insights about the design of questionnaires from a psychological perspective and elaborating on techniques of classification. During the next two decades, PFL wrote a huge number of papers and assembled his own together with papers from others in the highly influential *The Language of Social Research: A Reader in the Methodology of Social Research*, edited together with Morris Rosenberg and published with a leading publishing house for social sciences at that time, The Free Press, in 1955. He downplayed the number of papers that were his own by attributing some of them to Elias Smith, his pseudonym. While the reader's title was telling, only its subtitle provided a real rationale for the volume from the editors: by offering best practices the individual creative scholar could get a better starting background for her endeavors. In 1972, *Continuities in the Language of Social Research* expanded the scope of contributions even further, but by then the market for research technique textbooks was not as receptive as in the middle of the 1950s when the Lazarsfeld-Rosenberg reader was used nearly everywhere social research was taught.

Providing teaching material was one side of PFL's mission to transform empirical social research from an amateur activity into a cumulative scientific effort. From the very start in Vienna, he regularly brought together groups of collaborators, mostly subordinates working on his projects, to offer them instruction, develop new ideas and applications, and refine present ones. In addition to his social democratic background that favored egalitarianism, he was convinced that if one wants to become a good empirical social researcher one needs to go through a period of apprenticeship (Stehr, 1982: 154). There were several more or less well-defined steps one had to climb before one could reasonably start doing her own project. Even ancillaries such as secretaries, endlessly typing draft after draft of manuscripts, and *Strichler*, people who count questionnaires' answers by hand in the form of stripes on paper, could rise to higher levels of prosperity (one of PFL's first American secretaries, Rose K. Goldsen, eventually became a professor of sociology at Cornell University). Later on, when the Bureau of Applied Social Research (BASR) became affiliated with Columbia University, graduate students could start their careers at the BASR as a coder, calculator, or research assistant, use its data and infrastructure to write a dissertation, and then be hired as an affiliate of the 'Bureau,' as it was called. Those who successfully completed third party financed projects remained for a while or went on in their academic careers. PFL's attempts to institutionalize this form of instruction beyond the space of his 'firm' however failed.

The list of publications from PFL does not show any direction. Contrary to major sociological theoreticians, his oeuvre does not evolve like a program incubated step by step. Looking for a label for PFL's style of methodological thinking one could characterize it as offering solutions on demand. Several observers and witnesses confirmed that PFL always saw interesting connections between variables, caught evolving problems out of field notes, and detected spurious correlations much quicker than anyone else around the table. Some of these serendipitous problems he solved overnight, so to speak, others remained in his head and in his notes for very long periods. Let us for comparison look at one smaller revelation and one of the long-lasting methodological struggles PFL fought.

During the years PFL directed the Princeton Radio Research Project (1937–40), he invented, without calling it by the name, secondary analysis. He was able to do so because the financial backer of the whole project, the Rockefeller Foundation, did not press him to collect data first hand. The foundation officers were interested in understanding the then new mass communication device, the radio, and in particular its effects on the audience. At the very beginning the following question was put in front of the research team: "do those who listened to educational programs change their opinions afterward or not?" Ingeniously PFL persuaded market researchers to hand their data over to him and promised to deliver them surplus value in exchange. These data could not be analyzed in today's style of meta-analysis because the Hollerith machines that were used severely restricted reuse of punched cards, and data stacking techniques were not yet available. Still, PFL identified, in each study, crucial variables, cross-tabulated them, and then compared the results from the different studies. For instance, he was able to show that those who held an opinion beforehand overwhelmingly held that they did not care to intentionally listen to educational or political programs, but a third of those listening did reform their opinion afterward, be it by changing from one party to another, or from nonvoting to voting, and so on. PFL presented these insights first in a small paper (originally published as Lazarsfeld, 1939; reprinted in Lazarsfeld, 2011: pp. 401–416) where he inserted new variables step-by-step and came to revealing conclusions. Even more telling than the results is the long-lasting effect of the insight it provided. One could easily draw the invention of the panel study design back to these small observations about changes during a campaign. During the 1940 presidential campaign which resulted in the re-election of Franklin D. Roosevelt for the third time, PFL first used repeated interviews of the same sample of respondents, the panel design (Lazarsfeld et al., 1944).

Not all problems could be satisfactorily solved in similar ways, PFL worried. Take as an illustration his struggle finding out why people do what they do. Very early in his career he contemplated the occupational choices of young Austrian workers (Lazarsfeld, 1975a). Under the influence of his then mentor Karl Bühler he thought about the interplay between 'outer' and 'inner' factors and called the acting of one upon another a 'motive.' Unsatisfied with this pseudo-solution to his big problem PFL some years later, probably under the influence of those American sociologists who later became known as symbolic interactionists, distinguished between 'inner motives' and 'mechanism,' which direct an individual, and the outer 'situation,' whereby only the encounter of these two independent forces cause an 'action' (Lazarsfeld and Kornhauser, 1955). Some years later, he again returned to this topic when he tried to understand why people vote as they do. Now under the spell of quite another intellectual environment he theorized that a citizen, labeled an 'organism,' stands under the influence of on the one hand a stimulus, for example, a political campaign, that she recognizes selectively, and on the other hand a set of personal dispositions. This aspect of the formation of the voting process is the concern of psychology, whereas sociology studies the 'implementation' of all these causes, which results in a particular vote as the response to all the foregoing influences (Berelson et al., [1954]1986: 278). Still not really satisfied with this solution to the big problem, which he once jokingly called the "methodological equivalent of socialist voting and buying of soap" (Lazarsfeld, 1969: 279), he finally persuaded the editor of the 1968 edition of the *International Encyclopedia of the Social Sciences*, his longtime collaborator and later biographer David Sills, to reserve an entry for his 'theory': reason analysis (Kadushin, 1968). It does not diminish his legacy if one adds that this particular part of his oeuvre was not highly consequential.

Nothing could be further from the point than to come to the conclusion that PFL's attempts should be seen as failures. Just the opposite, along the way he found serendipitously other interesting things and even invented a machine: the famous Program Analyzer that documents positive versus negative evaluative responses by listeners, which was the result of his collaboration with Frank Stanton from CBS. During his whole career PFL codified data collection techniques, improved the phrasing of questions, and developed data analysis tools and routines.

Usually PFL is put into the quantitative camp of the social sciences which is correct only with some qualifications. The majority of his written contributions to methodology belong more or less to the quantitative branch, but from the very beginning until his last days PFL thought seriously about nonquantitative research strategies. Although he once argued prominently that qualitative research should be restricted to the exploratory steps of any research project (Barton and Lazarsfeld, 1955; reprinted in Lazarsfeld, 1993: 210–217), he conceded elsewhere to qualitative approaches a more independent value. First, PFL was never an advocate of random sample large-scale survey research. Instead he preferred smaller and pointed samples – as in all the famous voting studies under his direction: Erie County, Ohio; Decatur, Illinois; and Elmira, New York – but he was willing to go one step further by using case study designs from the very beginning onward.

Second, he assigned an independent role to qualitative analysis whenever quantitative data analysis resulted in anomalies it could not resolve statistically. PFL's plea for what he labeled 'deviant case analysis' did not get as much attention as others of his suggestions but it remained on the table since its first announcement.

Third, he even prepared a separate statement on methodology immediately after the study on unemployment was published in 1933. This study's subtitle classified the investigation as belonging to sociography, never a widely used name. The methodology manuscript remained unpublished but PFL recycled its main message when he wrote his memoir 34 years later. Quoting from the then still unpublished paper (now included in Lazarsfeld, 2011: 243–265) he proposed five rules for data collection:

> a. For any phenomenon one should have objective observations as well as introspective reports.
> b. Case studies should be properly combined with statistical information.
> c. Contemporary information should be supplemented by information on earlier phases of whatever is being studied.
> d. One should combine 'Natural and experimental data,' meaning questionnaires and solicited reports and unobtrusive measures.
>
> Lazarsfeld, 1969: p. 282

Given his educational background in mathematics it is no wonder that PFL tried to utilize his competences, but it seems that he largely abstained from pursuing this path, focusing instead on more substantive thinking. Whatever he might have contributed to the new specialty of mathematical sociology – obviously, he helped establish it organizationally – PFL remained an empiricist. While some of his collaborators and disciples later joined the newly formed rational choice camp in sociology, one could argue, probably convincingly, that PFL would have continued proposing an empirical theory of action (see Lazarsfeld, 2011) instead of jumping into the highly abstract mode of theorizing to be found in rational choice papers.

Substantive Contributions by PFL

PFL is very often reduced to his role as a methodologist, sometimes even more narrowly seen as a quantitativist; and he is not to be acquitted from contributing to this caricature, himself, for example, when he referred to this stereotype in jokes he made or quoted, not realizing that the audience might not get his irony (e.g., Lazarsfeld, 1972: xvi; Stehr, 1982). However, the list of substantive contributions to several special branches of sociology and neighboring disciplines is impressive, and the fact that decades after his death some of them are still quoted is impressive in itself. A study of socio-psychological consequences of long-lasting unemployment made him known to social scientists for the first time when in 1933 *Die Arbeitslosen von Marienthal* (The Unemployed of Marienthal) came out in print. Its first edition did not list any authors' names on the cover but indicated that the study had been done by the *Wirtschaftspsychologische Forschungsstelle*; the authors' Jewish-sounding names had been removed to secure

the study's publication at that turbulent time (see my introduction to the reprint for more details, Jahoda et al., [1933] 2002). During his first years in New York, PFL wrote some shorter papers on this topic and influenced through verbal communication Robert and Helen Lynd who redesigned their follow-up study *Middletown in Transition* (Lynd and Lynd, 1937) under the influence of *Marienthal*. Marie Jahoda, PFL's Marienthal study collaborator and first wife, exhibited a continuing interest in unemployment; she returned to this topic in the 1970s when the level of unemployment again was growing, whereas PFL stopped studying unemployment himself and contributed to this topic later on only indirectly as the dissertation supervisor of Mirra Komarovsky ([1940]1971).

PFL contributed several key ideas to mass media and audience research, and the studies done at the BASR formed what he called the 'Columbia tradition' (because he disliked 'school' as a designation). According to this tradition the effects of mass media are not as dramatic as educated lay people feared. As a consequence PFL did not buy into the hidden persuader message of Vance Packard, which influenced the upper stratum of middle class people in the whole Western world, and he refrained from joining the chorus of those lamenting the spread of mass society. The main point of disagreement between the Columbia perspective and the, in itself highly diverse, critical approaches can be formulated as the difference between causal attribution (media cause something) and second-tier effects (media support particular attitude formation). Critical theorists of mass media's influence argue that media itself, starting with the movie theater, radio, then television, and more recently the Internet, cause alienation, passivity, isolation, and so on, whereas PFL and his collaborators assigned to the media a more differentiated ensemble of functions (Katz, 1987). Obviously, mass media confer status to whatever is covered by them. Someone's appearance on a television show makes this person known to a huge number of viewers, and the same is true for political issues and other impersonal topics covered by the media. This way mass media legitimize the status of what they have chosen to present to their audience. Secondly, the mass media assure social norms. Recall that particular deviant behavior was banned from being broadcast up to very recent times, and 'problematic content' is still banned in countries like the People's Republic of China. During PFL's lifetime, this function was also enforced in advanced Western societies, and one can only speculate what he would say about recent developments that have nearly broken down any barriers by airing the weirdest forms of behavior. Nevertheless, the media suitability of only particular types of politicians, for example, could still be seen as proof of this point. Very much in agreement with any critical theorists, the Columbia duo – PFL and Robert K. Merton – identified as a third feature the narcotizing dysfunction of the media, something the two wrote about as early as 1948 but could be found in more recent studies on the decline of civility, weakening of social bonds, and so on (Lazarsfeld and Merton, 1948).

The most consequential and most often cited concepts PFL coined originated at the crossroad between audience and voting research. Studies about the formation of political decisions revealed telling insights. The two-step-flow of communication might be the most prominent. This was first mentioned, in a characteristically Lazarsfeldian way, in the closing remarks of *People's Choice*. There PFL hinted at more research that should be done, for which he asked for future money, and mentioned in particular the dissemination of political messages through opinion leaders and the micro details of the change of one's political opinion (Lazarsfeld et al., 1944). The notion of a two-step-flow derived from the community study he conducted where researchers first met 'opinion leaders,' and obtained people's reaction toward 'cross pressure' before Election Day, however did not see a direct and unequivocal impact of the media. The 'crystallizers,' – individuals who did not change their preferences during the campaign, reacted toward the media messages completely differently from those who followed the media for entertainment reasons, not to mention those who made use of the news to persuade members of their social networks for whom to vote.

Seminar discussions at the Bureau helped to develop another pair of concepts. BASR's associate director Merton distilled around that time, from different empirical material, the opposition of the local and the cosmopolitan (Merton, 1968: pp. 441–474). According to PFL and his colleagues, political messages could not be delivered to voters directly but only through the help of the cosmopolitan opinion leaders. Political parties, candidates, and anyone who wants to distribute their messages to audiences need the help of intermediators who enforce the message through their talking to other people. In *Personal Influence* PFL with the help of Elihu Katz refined and confirmed the two-step flow mechanism further (Katz and Lazarsfeld, 1955; for a more recent reevaluation see Simonson, 2006).

A third section of PFL's substantive contributions consists of his writings on the history of empirical social research, the present status of the field, and the utilization of applied social research. His concern with the past could be traced back at least to *Marienthal* when PFL suggested to his friend Hans Zeisel to round out the book with a historical sketch of sociography. *Academic Mind* (Lazarsfeld and Thielens, 1958), a monograph on the 'social scientist in a time of crisis' according to the subtitle, can be seen as the beginning of a 'sociology of the social sciences' as a distinct feature of PFL's portfolio. It also contains several of his own papers on the roots of the style of research he committed himself to. Particularly worthy of mention here is his rediscovery of Adolphe Quételet – PFL became Quételet Professor of Social Science at Columbia in 1962 – as a forerunner of quantitative studies, as also his commissioning of a couple of dissertations devoted to early stages of empirical social research in the United States, Germany, and France. Besides the rediscovery of a forgotten quantifier and the investigation of developments at the national level, his publications also contain investigations of the role of social sciences, and empirical social research in particular, in contemporary times. During the last decade-and-a-half of his life PFL devoted some of his curiosity to this topic and, again, he tried to persuade others to join him, this time less successfully than in his earlier attempts (Lazarsfeld et al., 1967, 1975).

Academic Mind demonstrates PFL's capabilities and convictions in more than one way. First of all, it took some courage to take over a study about the consequences of the hysteria

orchestrated by the US Senator Joseph McCarthy in the midst of the 1950s. Secondly, the design of the data collection is unique: PFL was able not only to hire two public opinion research agencies to administer the interviews but also commissioned David Riesman afterward to execute a restudy of both the interviewers and the interviewees to prove the validity of the whole study. The report of the findings is of the finest PFL and his collaborators could deliver. Cleverly constructed indices, measuring 'worry' and 'caution,' result in a combined index of apprehension. This measure varies according to characteristics of individuals and also with those of the place where one works: 'permissiveness' on the one side and 'quality of the college' on the other. If one has to select an exemplar for illustrating the BASR style of conducting empirical social research, this book could serve above all others. It is indeed surprising that when PFL came under fire for his 'abstracted empiricism' Mills [1972]1959 he did not pull out this book for defense, but instead reprinted the accusation (Lazarsfeld, 1972: 428–440).

The Personal Equation

In his 1969 'Memoir' PFL listed as a third factor to disentangle the roots of his research style, what he called the 'personal equation' – the two others were the ideological component and intellectual climate. Whether his introspective explanation was pertinent is not to be discussed here. But it is clear that in his case biography did shape his oeuvre. There is no book length biography of PFL at hand, but besides his autobiographical essay and some interviews he gave, we do have several biographical portraits providing the cornerstones of his trajectory (Sills, 1979, 1987; Pollak, 1980; Sills, 1987; Morrison, 1998). Born in 1901 into an assimilated Jewish upper middle class family in Vienna, young Paul was more affected by his mother than his reserved father Robert, a lawyer. Sofie Lazarsfeld (1881–1976) not only held a 'salon' in the family's inner district apartment, but she also earned recognition as an individual psychologist, as the dissidents from Freudianism under the leadership of Alfred Adler called their approach, and as the author of a counseling book *Woman's Experience of the Male* (1931). Due to the social network of his mother, PFL became acquainted with several leading intellectuals of the time. Friedrich Adler, no relation to Alfred, the lifelong lover of Sofie, impressed PFL both intellectually and politically. Because of him, PFL started studying mathematics, and after Adler's assassination of the Habsburg prime minister in 1916 PFL visited him in jail and took part in demonstrations outside court. PFL's early years were marked primarily by his political activism. Being what today in the United States would be called a 'community organizer' brought young PFL in close contact with workers and activists from the Social Democratic party. He organized summer camps for working class children and young adults where he also gave lessons. Party affiliations brought him to France for a while, and during his student years he also participated in a political cabaret and played the viola at the home of the Jahodas, the family of his first wife. His Jewishness was highly visible, but his affiliation with Judaism did not last long. When the Austrian Republic was founded in 1918 people could renounce their religion and become *religionslos* ('nonreligious'), and PFL immediately joined the group of nonbelievers. His Jewish background would have made it difficult to climb up in the party; and although this would not have been completely impossible, a regular career in the Austrian academic world was banned for leftist Jews. PFL, therefore, never held any official position at the University of Vienna but belonged to the circle around the psychologists Charlotte and Karl Bühler from their arrival in Vienna in 1924 until his move to New York in 1933. Intellectually, his perspective consisted of an Austro-Marxist view which functioned for him as a substitute for any formal education in social sciences, a diverse familiarity with both the academic and the extramural wing of psychology, and a competence in mathematics which enabled him to do statistical analyses at a much more sophisticated level than most of the other people around him doing social research. Due to the intellectual climate in interwar Vienna, he also picked up some of the ideas which later became known as the Vienna Circle of neopositivism.

PFL came to the United States first on a fellowship that the Rockefeller Foundation offered to 'bright young men,' as it was expressed back then. At the end of the 2-year (1933–35) fellowship, the still young man – recently divorced, jobless in his European hometown, which also had been taken over by a right wing authoritarian political movement, but possessing a considerable amount of cultural capital – took the riskier path and returned from his native Vienna to New York to look for a job. Thanks to Robert Lynd, PFL was able to secure a meager job in New Jersey, acting as a counsel for young unemployed people and being paid himself from New Deal schemes. He survived the first two years on the fringe of the academic world and got a chance in 1937 to run a well-funded research project, which became known as the Princeton Radio Research Project. From then onward PFL managed to hide himself inside institutions he himself had established. His first attempt, back in Vienna, where he founded a research unit called the *Wirtschaftspsychologische Forschungsstelle* in 1931, was a failure, economically. It never earned enough money to pay the bills, but it was intellectually stimulating enough to produce what is still the only world-renowned empirical social research book written by Austrians, the *Marienthal* study. In Newark, PFL managed to raise enough money so that his small unit could survive. After the first Rockefeller contract came to an end in 1940 PFL became a devoted and successful 'foundation beggar.'

In 1941, Columbia University hired two new sociology professors, PFL at the level of associate and Merton as assistant professor, because the department could not come to a consensus on what specialization they should prefer. Instead of fighting each other the two men who did not know each other before started a marvelous collaboration and also became close friends; both told the story first to a journalist and later wrote about it from their respective points of view (Hunt, 1961; Lazarsfeld, 1975; Merton, 1998). PFL remained in Columbia until he reached retirement age in 1969. Probably disappointed by Columbia not offering him emeritus status, he commuted during the last years of his life to the University of Pittsburgh, where he had been appointed Distinguished Professor of Social Sciences. As a consultant for the Ford Foundation and other

such organizations he traveled regularly to Europe, where he arranged consultancies or visiting professorships for himself in Oslo, Paris, and Vienna. At the Bureau, in particular, from whose directorship PFL resigned as early as in 1949 but where he remained an associate director for the rest of his life, he assembled a distinct group of disciples around him. Out of this microenvironment several famous studies emerged which did not fall into PFL's own field of specialization but whose authors had gotten much inspiration from him. To mention just a few: Lipset's *Union Democracy* (Lipset et al., 1956), Lerner's *Passing Tradition* (Lerner, 1963), and Coleman et al.'s early network study on the diffusion of knowledge within the medical profession (Coleman et al., 1966). However, it seems that the Bureau had its best time before the 1960s, at which time a new mood conquered the hearts and minds of young social scientists. PFL's ingenuity at getting funds from every corner of the moneyed world – the publisher of low-quality magazines McFadden, Philip Morris, or the Office of Naval Research – was suddenly seen from the opposite perspective, and he was accused of 'following the money.'

At least one generation lies between his death and the present, so PFL has become a figure from history. As such it would be worthwhile to see a full-fledged biography of him come out, one offering an interpretation of some of the sides of him that have been difficult to understand: his contradictory feelings of inferiority, marginality, superiority, and his professional self-confidence; why he saw his migration to New York more like an exile than an early instance of being a global player; his generosity and his bullying that some characterized as running a 'machine'; or his lack of awareness of the potentialities for misunderstandings as, for example, in the case of selecting the name of his own style of doing research, namely 'administrative research.'

While waiting for such a book it is worth studying his writings, at least to learn how good empirical social research has been administered.

Leader–Member Exchange Theory

Berrin Erdogan and Talya N Bauer, Portland State University, Portland, OR, USA

Abstract

Leader–member exchange (LMX) theory is a relationship-based, dyadic theory of leadership. According to this theory, leadership resides in the quality of the exchange relationship developed between leaders and their followers. High quality exchanges are characterized by trust, liking, and mutual respect, and the nature of the relationship quality has implications for job-related well-being and effectiveness of employees. This article summarizes what LMX is, how it is measured, and the best practices in the study of LMX. Studies conducted on its antecedents, and past research related to its consequences in organizational settings are reviewed. In addition, we review issues related to multiple relationships such as differentiation and relative LMX. Finally, we conclude the article by identifying and summarizing key themes and questions for future research.

Foundations of Leader–Member Exchange Theory

Leader–member exchange (LMX) theory is a relationship-based, dyadic theory of leadership. Unlike behavioral leadership theories that focus on what leaders do, such as transformational, authentic, servant, or empowering leadership theories, LMX theory rests firmly on the assumption that leaders influence employees in their group (referred to as members) through the quality of the relationships they develop with them. A high quality relationship is characterized by trust, liking, professional respect, and loyalty (Liden and Maslyn, 1998). One of the early findings of the LMX theory is that, leaders develop relationships of varying quality with their subordinates and such differentiation characterizes a wide majority of the work groups studied (Liden and Graen, 1980). The theory inspired and served as the basis of over 600 journal articles as of December 2013, with its popularity in leadership studies steadily increasing over the years.

Researchers tend to rely on a social exchange-based rationale to explain the nature of the relationship between LMX quality and its outcomes. High-quality relationships are characterized by the exchange of valued resources. In these relationships, leaders provide support, developmental opportunities, mentoring, and other benefits to the employee. The provision of such resources results in a motivation to reciprocate to the leader on the part of members, by demonstrating behaviors such as loyalty and higher levels of voluntary behaviors. In other words, feeling obligation and high levels of commitment to the supervisor are often thought of as the link between high LMX quality and promanager and sometimes proorganizational behaviors. Furthermore, the degree to which the employees regard their leader's promises to be fulfilled is a link between LMX quality and outcomes. For example, Dulac et al. (2008) showed that psychological contract violation was a mediator of the relationship between LMX quality and outcomes including trust and turnover intentions.

When the nomological network of leader behaviors (such as transformational or ethical leadership) and outcomes (such as commitment and effectiveness) is considered, LMX quality is thought of as a mediator (e.g., Walumbwa et al., 2011; Wang et al., 2005). This is because the manner in which leaders behave toward members is an indicator of how supportive, trustworthy, and loyal the leader is toward members, which feeds into the relationship quality positively or negatively. At the same time, studies linking leader behaviors to LMX quality tend not to adopt a longitudinal design, nor involve newly forming relationships. Thus, it could alternatively be argued that those in a high-quality exchange will perceive their leaders as more transformational, ethical, authentic, and less abusive and undermining.

Measurement of Exchange Quality

Most empirical research on LMX theory utilizes one of two measures. The LMX-7 measure (Scandura and Graen, 1984) is unidimensional and consists of seven items. The LMX-Multidimensional (Liden and Maslyn, 1998) consists of 12 items capturing four dimensions with three items each (affect, loyalty, contribution, and professional respect). The multidimensional measure consists of highly correlated dimensions falling under a second-order factor and many researchers choose to collapse the dimensions. This choice is typically driven by the research question at hand. Meta-analytic results suggest that type of measure is not an influence over observed relationships (Dulebohn et al., 2012).

Another common tendency within LMX studies is to measure LMX quality from the perspective of the employee. According to a review article by Hiller et al. (2011), in the period between 1985 and 2009, 83% of all LMX studies captured the employee perspective. When LMX is measured from the perspective of members *and* leaders, correlations tend to be modest. Sin et al. (2009) reported a meta-analytic correlation of 0.37 between the two. Furthermore, the correlation tends to be smaller during the early stages of relationship development, and the overlap increases as time goes by (Nahrgang et al., 2009). The lack of agreement could be explained by a number of different mechanisms. First, when employees and managers are each asked the degree to which they like, respect, and feel loyalty to the other party, it is natural that the way each party regards the other could be different. In other words, parties to the exchange are not necessarily reporting an objective reality: Instead they are reporting their thoughts about the other as an exchange partner. Because these

perceptions will influence their own attitudes and behaviors, they are each valid for the respondent. Second, each person may have different levels of success in meeting the other's expectations in their dyad. Third, leaders may be less likely to report a low-quality exchange with a team member, given social desirability concerns. Finally, the measurement approach may be responsible for some of the low observed correlations. If employees are asked to report the degree to which their manager likes, respects, and values them as opposed to the degree to which they like, respect, and value their manager, the relationship may emerge as stronger. Because of the divergence in perspectives, it seems that the employee perspective emerged as the *de facto* norm in measuring LMX quality in empirical studies. As a result, we know more about the consequences of employee perceptions of LMX quality as opposed to manager perceptions. Investigations into the implications of convergence between employee and manager perspectives are still in their infancy.

Research methodology tends to make a difference in LMX studies. Major studies of LMX tend to involve collecting data from intact teams where each member reporting to the same manager is invited to participate in the study. When researchers reach out to managers and members independently of each other, every member and leader is given the opportunity to participate in the study. In contrast, in studies using ad hoc sampling methods, researchers invite employees to participate in the study and employees are asked to give a corresponding survey to their managers. Alternatively, some studies rely on asking managers to distribute surveys to a few of the employees reporting to them. Meta-analytic evidence shows that in studies utilizing ad hoc sampling, the convergence between employee and manager perspectives of LMX quality is higher (Sin et al., 2009). Sampling bias is a possible explanation, and is, in our view, a weaker design, as it cannot rule out faking of data. At the very least, in such designs surveys are more likely to be distributed to those who have a higher quality exchange with the leader.

Development of High-Quality Relationships: LMX Antecedents

Figure 1 summarizes the antecedents and consequences we will cover in this article. While there are potentially additional constructs we could have included, we chose to focus on the most commonly studied and most potentially impactful constructs we uncovered in our literature review. One such question is: *How are high-quality exchanges developed?* Answering this question effectively requires studying leader–member dyads as they are in the formation stage of the relationship. Such studies have been rare, but informative. As an early example of such research, Liden et al. (1993) studied 166 new university employees and their supervisors at four time periods. This study showed that contrary to researchers' expectations, demographic similarity or leader-rated performance had little influence over LMX quality. Instead, the important predictors emerged to be perceived similarity, member expectations of the leader, and leader expectations of the member. In other words, similarity–attraction phenomenon seems to play an important role in LMX development.

'Testing' of the exchange partner is thought to be at the heart of LMX development. When the relationship begins, trust develops (or does not develop) as a result of a mutual testing process (Dienesch and Liden, 1986). Employee's satisfactory responses to the testing efforts of leaders result in the development of trust on the part of the leader. Bauer and Green (1996) examined this process in a sample of new employees and managers. Graduating students at a university filled out surveys, once before, and twice after the start of their new jobs. This study showed that early positive performance of employees was reciprocated with further delegation of responsibilities on the part of managers that resulted in higher levels of performance. The result of this trust development process was high LMX quality. In other words, member performance and competence appear to be important predictors in the LMX development process as these are helpful behaviors in establishing trustworthiness.

In a more recent study, Nahrgang et al. (2009) examined MBA student led undergraduate teams, surveying them multiple times in the relationship development process. This study showed that early predictors of LMX quality were different from later predictors. In the earliest stages, member personality traits (extraversion and agreeableness) were predictors of LMX. In later stages, member performance emerged as a more important predictor. It seems that factors that are more influential in the first few days are different from factors that are more influential as weeks pass and members

Figure 1 Summary of the antecedents and consequences of LMX relationships. LMX, leader–member exchange; OCBs, organizational citizenship behaviors.

have the opportunity to display their competence and effectiveness.

In addition to member performance and similarity to leaders, member personality has been frequently examined as a predictor in cross-sectional work. Meta-analytic results (Dulebohn et al., 2012) revealed that following member competence and perceived similarity, member positive affectivity and the locus of control are the characteristics with the strongest correlations to LMX quality. Furthermore, goal orientation has been explored as an antecedent. Mastery orientation, which refers to the degree to which a person is interested in acquiring new skills, improving and learning, has been shown to be positively related to LMX quality, whereas performance orientation, which refers to the degree to which the person is preoccupied with looking like a high performer and being evaluated well, has been negatively related (Janssen and van Yperen, 2004).

Leader–member actual similarity (as opposed to perceived similarity) has been explored as a predictor, and only recently researchers started identifying patterns of relationships. Zhang et al. (2012) showed, using polynomial regression, that leader and member similarity in proactive personality was related to LMX quality. Furthermore, the direction of the dissimilarity also mattered: When leaders had higher proactive personality compared to members, dissimilarity was much more detrimental.

While performance and competence are important currencies of exchange helping build trust, newcomers react positively to manager behaviors that communicate manager support of the newcomer. For example, in a study of newcomers in telemarketing organizations, Sluss and Thompson (2012) found that how supervisors socialized newcomers in the form of providing advice, role modeling, and guidance were associated with higher LMX quality.

Among leader behaviors associated with LMX quality, perhaps the most consistent is leader fairness. Masterson et al. (2000) showed that interactional justice, or a sense of treatment with dignity and respect was associated with LMX quality. This study and others (e.g., Erdogan et al., 2006) contended that leader fairness would relate to LMX quality whereas organizational fairness such as procedural justice would relate to the quality of the exchange relationship with the organization in general. Recent meta-analytic evidence is not supportive of this distinction: Colquitt et al. (2013) showed that supervisor-focused and organization-focused justice perceptions did not differ in their strength of relationship with LMX quality. In other words, even when researchers make an effort to measure organizational justice perceptions, it is likely that supervisors are regarded as at least partially responsible for the observed state of affairs, resulting in higher LMX.

Once established, how stable are LMX relationships? This is an underinvestigated but important research question. Longitudinal research (e.g., Liden et al., 1993) indicates that LMX relationships start being developed very early in the relationship (within the first days and weeks) and show remarkable stability (Liden et al., 1993). One potential reason for this is that once a relationship is categorized as high or low trust, individuals interpret later events and actions using that lens and the relationship does not change dramatically. Shapiro et al. (2011) explored the effects of leader transgressions on subsequent relationship quality and the likelihood of members to engage in punitive actions following such transgressions. The results showed that leaders in high-quality exchanges with their members had substantial levels of idiosyncrasy credits, leading to lesser likelihood of punitive action toward leaders who engage in potentially trust-violating behaviors. High-quality relations may afford dyad members higher capacity to forgive their exchange partner.

Consequences of High-Quality Relationships

Job attitudes are among the most frequently studied outcomes of LMX quality. Meta-analytic evidence (Dulebohn et al., 2012; Gerstner and Day, 1997) showed that job satisfaction, organizational commitment, and turnover intentions are consistently correlated with LMX quality. The relationship between LMX quality and actual turnover has been more inconsistent, with simple correlations close to zero (Gerstner and Day, 1997). A contextual approach has proven helpful in understanding this relationship. For example, Bauer et al. (2006) showed that in a sample of new high-level pharmaceutical executives, the LMX to turnover relationship was contingent on the extraversion level of the new executive, with LMX mattering only for the turnover behavior of employees who were relatively lower in extraversion.

High LMX members also demonstrate more desirable behaviors. The relationship between LMX and behaviors such as task performance and citizenship behaviors has been well documented (Dulebohn et al., 2012; Gerstner and Day, 1997; Ilies et al., 2007). Furthermore, high LMX members demonstrate behaviors that are desirable within the particular organizational context. For example, Hofmann et al. (2003) showed that LMX quality was positively related to safety citizenship behaviors (such as being proactive about removing safety hazards) when safety climate in the organization is high. In other words, high LMX members tend to 'fit the mold' and demonstrate behaviors that are desirable within that context.

LMX quality has been associated with career success. Wayne et al. (1999) showed relations with supervisor ratings of promotability, actual salary progression, and career satisfaction for those who have a high-quality LMX. High LMX members tend to be more successful. This is probably due to at least two mechanisms. High LMX members tend to have higher levels of performance ratings, and given that these ratings are obtained from supervisors, such a relationship is not surprising. Furthermore, high LMX members may be 'sponsored' to a greater degree by their managers. By introducing the member to influential others, giving guidance about how to advance, or informing high LMX members of impactful and visible opportunities within the organization, managers may play an important role in the career success of high LMX members. Of course, such sponsorship is also contingent on the degree to which the leader is in a position to provide these benefits. For example, Sparrowe and Liden (2005) showed that LMX quality was positively related to member emergence as a central actor in the work group advice network. However, this relationship was contingent on the degree to which the leader was central in the advice network among leaders.

LMX quality has effects that go beyond the leader–member dyad. For example, researchers have explored the relationship between the leader's LMX quality with his/her own boss, and its implications for the employees the leader supervises. The relationship between leaders and their own bosses is referred to as the leader–leader exchange (LLX) and it has been demonstrated that leaders with high LLX are in a better position to develop high-quality exchanges with their subordinates (Venkataramani et al., 2010). Leaders with high LLX have also been shown to provide higher levels of empowerment for their own members (Zhou et al., 2012). This could be a result of learning where leaders observe how to build effective relations from their own managers and model the same behaviors to their subordinates, or it could be because high LLX puts managers in a better position to provide valuable resources to their own lower-level exchange partners.

When Do High-Quality Relationships Matter the Most?

LMX seems to be more important, more influential, and more impactful for some members as opposed to others. Factors that increase the importance of LMX quality include introversion (Bauer et al., 2006), and low levels of person–organization fit or value congruence (Erdogan et al., 2004). These moderators suggest that some employees may need and value the benefits associated with high-quality LMXs more than others. The absence of high LMX quality can also be dealt with through structural mechanisms. For example, one of the key benefits associated with high LMX is high empowerment (Dulebohn et al., 2012). Perhaps for this reason, research examining negotiated special deals between employees and organizations (termed idiosyncratic deals, or i-deals) has shown that such deals were most strongly related to desirable organizational behaviors for employees with low LMX quality. This is likely because high LMX members are given more flexibility and autonomy, and structural arrangements make more difference for employees who are not in a position to receive these benefits.

Furthermore, some leaders are simply more powerful, more resourceful, and better positioned, allowing them to provide more meaningful benefits to their high LMX members. In other words, not all LMX relationships are created equal because no two dyadic partners are the same. When people feel that the leader embodies the organization (due to being in a high-level position or being in a position of authority), LMX quality is more positively related to attachment to the organization (Eisenberger et al., 2010). Similarly, when managers perceive greater levels of support from the organization (Erdogan and Enders, 2007), the effects of LMX quality for employee job attitudes and performance are greater.

Is LMX quality more important in some cultures compared to others? Studies of LMX have been conducted around the world, including collectivistic and power-distant cultures. Rockstuhl et al. (2012) conducted a meta-analysis comparing the pattern of relations between LMX, job attitudes, and behaviors around the world. Their results suggested that in horizontal-individualistic (i.e., Western) cultures, the relations between LMX, citizenship behaviors, trust in leader, and justice perceptions were stronger compared to that in vertical-collectivist (e.g., Asian) cultures. At the same time, there were no significant differences among correlations between LMX, commitment, and job performance. Even when such differences existed, they were modest. For example, the largest difference in correlations was between LMX and distributive justice, which was 0.46 vs 0.30. While the difference is statically significant, even in collectivistic cultures LMX seems to be meaningfully associated with and explain substantial variation in employee attitudes and behaviors.

Emerging Issues: LMX Differentiation and Relative LMX

In the recent years, the focus of LMX theory started including the implications of differentiated exchanges. In fact, the distinctiveness of LMX theory from other leader behavior theories resides in its recognition that leadership varies across dyads, and within the same work group there will be variation in the quality of exchanges managers develop with their different employees. However, the majority of LMX studies in the past four decades focused on understanding antecedents, consequences, and moderators of these relationships at the individual level.

Recently, LMX differentiation started becoming the focus of LMX studies. LMX differentiation refers to the degree to which the quality of LMXs within the work group varies. Oftentimes, LMX differentiation is operationalized using the standard deviation of LMXs within the work group, with the provision that the response rate within the group is high (60% is a frequently used cutoff point for response rates; for example, Liden et al., 2006). Liden et al. (2006) showed that LMX differentiation is positively related to group performance to the degree to which members report high task interdependence and their LMX median in the group is low. The argument Liden et al. made was that LMX differentiation may be beneficial to members given that it will ensure an appropriate role differentiation. At the same time, subsequently scholars recognized the potential downsides of LMX differentiation in the form of poorer-quality job attitudes, higher levels of conflict, and lower well-being (Hooper and Martin, 2008).

The importance of LMX differentiation studies is the understanding that employees are aware of each others' LMX quality with the manager. Further, dissimilarity in LMX quality within the work group has negative consequences for members. For example, Sherony and Green (2002) showed that among pairs of coworkers, the interaction of the two LMXs was related to the quality of the relationship between coworkers. In other words, when LMX quality of one coworker diverged from the other, coworker–coworker exchanges were negatively affected. By the same token, variation within the work group is thought to be associated with negative outcomes for members as well as groups, because LMX differentiation tends to indicate that some members do not have a high-quality exchange with the leader, potentially resulting in envy, differences in resource distributions, even potential for feelings of favoritism. Low LMX differentiation is a more inclusive leadership style (provided that the mean level of LMX is high within the group) and such inclusiveness contributes to retention, particularly in diverse work groups (Nishii and Mayer, 2009).

It is important to note that the presence of LMX differentiation increases the salience of fairness concerns. Erdogan and Bauer (2010) showed that the effects of LMX differentiation on work attitudes, coworker relations, and retention within the work group were contingent on the fairness climate that existed in the group such that, LMX differentiation had negative effects on outcomes only when fairness climate was low.

Studies on LMX differentiation highlight the importance of employee awareness of how LMXs are distributed within the group. Employees react not only to their own relationship quality, but also to their coworkers' relationship quality, and distribution of LMXs matter. Taking this idea a step further, scholars also started investigating social comparison processes directly, by introducing the concept of relative LMX. Relative LMX is a statistical computation of the degree to which a person's LMX quality is higher or lower than the team's LMX average. Utilizing a social comparison approach, scholars argued that having a higher-quality exchange compared to one's team members is a source of satisfaction. Controlling for one's LMX quality, relative LMX is positively related to self-efficacy, performance, citizenship behaviors (Hu and Liden, 2013), and psychological contract fulfillment (Henderson et al., 2008).

In addition to examining relative LMX operationalized as the difference between focal person's LMX score from the group mean, researchers developed a perceptual measure of relative LMX, directly asking individuals to compare their own relationship quality to the other relations the leader develops with team members. Vidyarthi et al. (2010) found that this perception (labeled as LMX social comparisons) explained variation in performance and citizenship behaviors controlling for LMX and relative LMX, again indicating the importance of LMX distribution on member behaviors.

It seems that such interpersonal comparisons among coworkers necessitate explicit attention to the context of a focal LMX relationship. Other LMXs, including a leader's LMX quality with a superior, one's coworkers' LMX, the nature of LMX distribution within the work group and how much diversity exists in LMX quality, how one's LMX compares to one's team members (in actuality and perceptually) are all increasingly well studied constructs gaining research attention. We predict that these areas will witness further research activity.

Future Research Opportunities and Directions

Investigations of the nomological network of LMX quality are numerous and this is a mature field of investigation. Yet, there are still research avenues that are important to investigate. One issue is the evolving nature of organizations. LMX theory originated in the 1970s, at a time organizations were characterized by tall hierarchies, unity of command, and authority concentrated more at the top. Today, while such organizations continue to exist, there are more novel and contemporary structures under which managers and employees develop relationships. For example, in many contemporary organizations, employees may report to more than one manager, whereas LMX theory is based on the assumption that each member has one, clearly identifiable manager who controls resources valued by the member.

Recent research (Vidyarthi et al., 2014) has examined LMX relationships in such a context and showed that in a sample of information technology consultants reporting to two managers, convergence of the quality of these relationships was associated with more positive outcomes. The authors contended that each LMX relationship would serve as a comparison point for the other relationship, evoking social comparison processes. In other words, similar to the comparisons employees engage in with their coworkers' LMXs, it seems that they also compare the multiple exchanges they have with different leaders in their work lives. Such findings indicate that LMX theory would benefit from an extension and testing of the theory in settings that are different from the traditional organizational forms. As organizations introduce matrix structures where members report to multiple leaders for finite periods of time, or when they eliminate managers by introducing lattice organizations where there are no assigned leaders, the utility of the theory remains unclear. Extension of LMX theory to contemporary organizational structures is an important future direction.

A second research direction relates to an examination of LMX quality in relation to coworker relationships. We know that LMX quality is associated with positive job attitudes and behaviors. However, we know significantly less about when and why coworkers experience envy or jealousy, or feel negatively toward high LMX members. Are high LMX members more sought after among coworkers because they are a liaison to the manager? Or are they shunned and avoided because they are regarded as teacher's pets? When does each happen? Erdogan et al. (in press) showed that the degree to which LMX quality is positively associated with one aspect of coworker relations (advice network centrality) is contingent on the degree to which high LMX members also demonstrate helpfulness and discretion. Systematic investigation of the effects of LMX quality on coworker emotions, behaviors, and reactions to the focal person is a noteworthy area of research. The importance of this topic is also evidenced by the fact that the most recent meta-analysis in LMX theory (Dulebohn et al., 2012) includes relationships of LMX to a large number of outcomes, but any indicators of coworker relationships is curiously missing, which likely indicates the small number of studies examining LMX quality in relation to coworker relations.

Finally, an interesting, but underinvestigated, research topic is whether high LMX quality is uniformly desirable or whether it may have a dark side for the dyad members or the organization. The vast majority of the literature focuses on how high LMX quality contributes to individually and organizationally desirable outcomes such as job attitudes, behaviors, and work-related well-being. Yet, is it possible that there are potential downsides to having a high-quality exchange with a manager? Under what situations such negative repercussions would emerge? The only example of a potential 'dark side' to LMX was revealed by Ballinger et al. (2010). In their investigation of employees working in veterinary hospitals, they showed that while LMX quality was negatively related to actual turnover, following leader turnover high LMX members demonstrated increased probability to leave. In other words, one interesting and important downside of high LMX relationships is that when they leave, they may take those close to them with them.

Identifying and understanding any potential downsides to LMX quality remain important to fully understand how this theory can be utilized to increase leadership effectiveness in the workplace.

Conclusion

In conclusion, while research on LMX has entered a mature phase where much is known about its measurement, antecedents, boundary conditions, and consequences, much also remains left to uncover. In this article, we summarized what is known but also highlighted avenues for future research. These include future understanding of how LMX relationships develop and the boundary conditions for relationship development, how LMX is measured, how relative LMX affects what we know, as well as the key future research themes of the changing nature of work in terms of content and organizational structures, the influence of the social network of relationships, as well as the dark side of LMX. Given these and other potential research questions, we are excited about the future of LMX as a vibrant research area.

Abstract

Leadership is the process through which one or more people influence other group members in a way that motivates them to contribute to the achievement of group goals. As such, it is a group process that is demonstrated through the followership of others. Over time, the field of leadership research has moved through several distinct phases. Initially, a classical approach viewed leadership as a reflection of particular individuals' special qualities. This was then supplanted by a contextual approach which supplemented this analysis with considerations of social and organizational context. More recently, an identity approach has emphasized the importance of the psychological bond between leaders and followers. This progression represents a response to four key observations about the leadership process: (1) different forms of leadership are required in different contexts, (2) followers' perceptions of leaders are critical, (3) leaders and followers motivate and influence each other, and (4) in the process of developing the power to change the world, leaders and followers are themselves transformed.

Leadership is the process of influencing people in a way that motivates them to contribute to the achievement of group goals (e.g., Haslam et al., 2011; Hollander, 1985). As such, it is a central feature of effective organizations and societies, and the focus of intense academic and public debate for over 2000 years. Testament to this, the British Library in London holds over 12 000 books that have leadership in their title (including 35 that are simply entitled *Leadership*). This interest arises from the fact that in fields as diverse as politics and religion, science and technology, art and literature, sport and adventure, industry and business, leadership is commonly seen as the process by which means people are marshaled to contribute to the collective projects that ultimately become the stuff of history.

Definitional Issues

The above definition of leadership contains at least four important elements that are important to recognize. First, leadership is a process not a property. Accordingly, it is not something that a person possesses, but rather something that he or she *does*. Second, leadership is not something that a person does on his or her own. It necessarily involves *other* people – most particularly, those over whom influence is exerted. Third, it follows from this that ultimate proof of leadership is not found in the actions of leaders (e.g., their speeches, their policy, their vision), but in the *followership* of those they influence (Gibb, 1947; Haslam et al., 2011; Hollander, 1995). Fourth, it is important to distinguish leadership from a range of other processes with which it is commonly confused. Leadership is not primarily a matter of power, coercion, or resource management (Turner, 2005). Rather, because it is about influence, it is about winning others over so that they *want to do* what is being asked of them and do so willingly not grudgingly, with enthusiasm rather than rancor.

Bearing these points in mind, the literature on leadership is primarily concerned with the question of what it is that allows the plans and vision of an individual to be translated into the actions of a group. What is it that turns one person's wishes into a mission that directs the work of dozens, thousands, or millions of other people?

As we argue in our recent book, *The New Psychology of Leadership* (Haslam et al., 2011), over time researchers have tended to answer this question in one of three broad ways. Those who follow a *classical approach* generally frame their answers in terms of the qualities that particular individuals have (or do not have). Building upon this, adherents of a *contextual approach* tend to supplement such analysis with a consideration of features of social and organizational context that promote (or else compromise) the effectiveness of individual leaders. And finally proponents of an *identity* approach see leadership as a group process that centers on a social–psychological bond between leaders and followers. While the first of these approaches can be considered 'old,' the second is more 'contemporary,' and the third is relatively 'new' (Haslam et al., 2011).

The Old Psychology of Leadership: A Classical Approach

According to Plato (380BC/1993), leaders are those small number of people who are born with a cluster of traits that set them apart from the general population – for example, quickness of learning, courage, and broadness of vision. Although it was largely discursive and anecdotal, Plato's analysis provided a narrative framework that has informed most leadership research in the subsequent two-and-a-half millennia – a literature that can be sampled liberally in the popular texts that proliferate in airport bookstores. Its popularity, however, was cemented in the nineteenth century through the writings of the Scottish essayist Thomas Carlyle who declared "the history of what man has accomplished in this world, is at bottom the History of the Great Men who have worked here" (1840: p. 5). Carlyle's 'great man' analysis

focused his readers' attention firmly on the psychology of individual (male) leaders and argued that their distinctive and exceptional qualities qualified them not only for responsibility and high office, but also for widespread admiration and respect. More recently, it is also the exceptional nature of such 'stuff' that is seen to justify the exorbitant salaries that are routinely awarded to executive leaders.

What, though, is the stuff of leadership? In an early influential review, Stogdill (1948) identified 29 personality dimensions that various researchers had associated with successful leadership. Within these, he singled out five factors for special attention: capacity, achievement, responsibility, participation, and status. In a later review, Mann (1959) looked at the predictive power of over 500 different personality measures that he organized into seven meaningful clusters: intelligence, adjustment, extroversion, sensitivity, masculinity, conservatism, and dominance. The primary observation in both reviews was that personal attributes are generally rather unreliable predictors of leadership. Nevertheless, two attributes have proved to have enduring appeal for researchers and commentators alike – charisma and intelligence.

Leadership as Charisma

Although it was an important concept in earlier writings (particularly, early Christian commentaries; Esler, 2003), the term charisma is generally seen to have been popularized by the German social and economic theorist Max Weber. For Weber (1921/1946) *charisma* was "a certain quality of an individual personality by which [a leader] is set apart from ordinary men and treated as endowed with superhuman, or at least specifically exceptional powers or qualities," (p. 359). Inspired by this, in recent years, neo-Weberians have treated charisma as an aspect of leadership that hinges on an individual's capacity to articulate a group vision, to recruit others to his or her cause, and to develop close and strong relationships with group members (e.g., Bass and Riggio, 2006; Burns, 1978).

Consistent with this analysis, research provides fairly consistent evidence that leaders who are both visionary and empathic are more successful than those who are not. In particular, findings from major studies in the 1940s showed that leaders who *initiate structure* (e.g., by devising plans that flesh out their vision) and show *consideration* toward followers tend to be more successful than those who do not (Fleishman and Peters, 1962). Research in this tradition also indicates, however, that followers' *perceptions* are critical in this process. This speaks to Weber's observation that it is followers who confer charisma upon the leader and who, on this basis, prove willing to commit their energies to his or her cause. At the same time, though, there is also evidence that such attributions vary considerably with features of the social context. Among other things, this is because evaluators seem generally to see leaders of in-groups to be far more charismatic than those who lead out-groups (Platow et al., 2006).

Leadership as Intelligence

Despite the fact that the construct of charisma therefore seems quite 'slippery,' one might imagine that – as a result of its proud psychometric heritage – *intelligence* would prove to deliver greater predictive traction. Indeed, a key reason why this has been an important research focus is that in most reviews this emerges as the best single predictor of leader success (e.g., Mann, 1959). However, measures of leader intelligence such as IQ typically account for only a very small amount of variance in leader success (around 3–5%), whereas again *perceived* intelligence accounts for far more (around 30%; Judge et al., 2004). Moreover, it also appears that analytic intelligence (of the form measured by IQ tests) is often less predictive of leaders' success than their creative intelligence and emotional intelligence (defined as "the ability to understand and manage moods and emotions in the self and others"; George, 2000). In the end, however, as with charisma, these various forms of intelligence prove extremely hard to pin down (Antonakis et al., 2009), and whether or not a person is perceived to have them varies markedly as a function of who is doing the perceiving and when. Accordingly, over time, such observations have led researchers to place increasing emphasis on the importance of *social context* in the leadership process.

The Contemporary Psychology of Leadership: A Contextual Approach

In response to the limited predictive power of approaches that focus only on the character of the leader in isolation, most contemporary researchers advocate *contextual* approaches to leadership that take account of the situations in which leaders operate. Radical approaches of this form suggest that context is everything, and that the character of the individual counts for nothing (e.g., as proposed by Zimbardo in his analysis of the Stanford Prison Experiment; Zimbardo, 2007). However, largely because these models envisage leaders as having little or no role to play in the leadership process, such analyses have garnered little support among leadership theorists and practitioners. It is therefore far more common for researchers to endorse *contingency models* in which context is seen to moderate but not entirely suppress the contribution of the individual leader.

Leadership as Contingency

The contingency approach is defined by the assertion that leadership arises from a perfect match between the individual and the circumstances of the group that he or she leads (Gibb, 1958). There are a very large number of such theories, but Fred Fiedler's (1964) *least preferred co-worker* (LPC) model is probably the most influential (at least in academic circles). This argues that leaders can be distinguished in terms of their disposition toward their LPC and that context can be differentiated in terms of (1) the quality of leader–member relations, (2) the degree to which the task is structured, and (3) the leader's position power. High-LPC leaders (those with a positive view of their LPC) are predicted to be the most effective in conditions where either (1) relations are good, structure is high, and the leader's position is strong, or (2) relations are bad, structure is low, and the leader's position is either weak or strong. Stated crudely, task-oriented, or 'hard' (i.e., low-LPC) leaders are predicted to do well when conditions are all very

favorable or all very unfavorable, but relationship-oriented or 'soft' (i.e., high-LPC) leaders are predicted to do well when conditions are more mixed.

Contingency theories vary considerably in the attributes of the leader and the characteristics of the situation that they consider important. Nonetheless, they remain the most widely embraced class of leadership theory (Fiedler and House, 1994). In particular, they are a popular component of management and personal development courses that typically seek first to classify individuals as having a particular leadership style and then to train them to identify (or create) situations in which this style will be effective.

Yet, despite being very popular, there are some serious empirical and theoretical problems with such models. In the first instance, they can be criticized for being reductionist in their attempts to distil a complex whole down to a limited subset of component parts that are seen as fixed and as having no capacity to shape each other. For example, these approaches do not allow for the possibility that the quality of leader–member relations might have a bearing on a leader's power (and vice versa) or that perceptions of task structure might be a determinant of leader–member relations (and vice versa). Such objections speak to the fact that contingency models typically treat the interaction between person and context as *mechanical* rather than *dynamic* (Reynolds et al., 2010).

A somewhat different problem is that while contingency models, like Fiedler's, recognize the importance of leaders' relationship with followers, those followers are themselves not subjected to any meaningful form of psychological analysis. Might not their perceptions of the leadership process differ from those of the leader, and might not this have a bearing on their followership? As with classical approaches, a core problem with contingency models is thus that they treat rank-and-file group members as passive consumers of leadership rather than active agents (Reicher et al., 2005). Beyond these theoretical concerns, however, an even more basic problem is that empirical support for such models is mixed at best – and tends to become weaker as tests move from the laboratory into the field.

Leadership as Transaction

Disenchantment with basic contingency models is reflected in two distinct theoretical movements that have grown in popularity in recent decades. The first of these is the *transactional approach*. This argues that any analysis of leadership needs to be complemented by an examination of the role that followers play in validating and empowering any leader. Most closely associated with the work of Edwin Hollander (1964), this approach argues that leadership emerges from a process of *social exchange* whereby followers work to enact a leader's commands only when they believe that the leader is doing something for them in return. More specifically, it is suggested that followers will only respond constructively to a leader's creative ideas if that leader has built up 'idiosyncrasy credits' based on demonstrated service to the group. As support for this analysis, research points to evidence that followers are more likely to support a leader if he or she is elected rather than appointed, and if he or she emerges from within the group rather than being imposed on it from outside.

Much of Hollander's own work has involved exploring the relevance of these ideas to leadership in the world at large (e.g., Hollander, 1995). In particular, he notes that large disparities in the benefits that leaders and followers receive for their work will tend to trigger a sense of inequity that ultimately detracts from group performance. Aside from an impressive array of empirical studies that bear this point out, this analysis can also be seen to provide a compelling explanation for failures of big business (e.g., as seen in the 2008 Global Financial Crisis) – where unfettered enthusiasm for the ideology of the 'great man' leads to overconfidence in the abilities of a few highly paid leaders and disregard for the legitimate concerns of followers.

More recently, though, empirical work on the transactional dimensions of leadership has also been taken forward by proponents of *leader–member exchange (LMX) theory* (e.g., Graen and Uhl-Bien, 1995). A key argument here is that low-quality LMX relationships (which center on standard contractual obligations) tend to lead to negative group outcomes, whereas high-quality relationships (in which both parties actively promote the interests of each other) enhance outcomes not only for those who share that relationship (e.g., the specific leader and follower) but also for the broader entity of which they are part (e.g., the group or organization as a whole).

A large body of empirical work is consistent with these arguments – showing that when leaders and followers are motivated to help each other out, this tends to have positive consequences both for them and their group (Ilies et al., 2007). Exchange-based approaches also have intuitive appeal because explaining leadership with recourse to a cost–benefit analysis makes sense in terms of theories of economic exchange that have widespread currency elsewhere in psychology (and in the social sciences more generally, particularly sociology and economics). Nevertheless, the concepts of 'cost' and 'benefit' prove to be very elastic and can be difficult (if not impossible) to specify independently of the vantage point from which they are assessed. One followers' meat is another's poison, and indeed what the same follower considers meat in one context, he or she will consider poison in another.

Finally, again, another objection to this approach is that it reduces a higher-order experience to a relatively mechanical cost–benefit analysis. Whereas plenty of texts attest to the joy of experiencing great leadership, *The Joy of LMX* seems an unlikely title. In part this is because it treats followership as a question of "What is in it for me?," when such questions seem remote from the phenomenology of successful leadership. Indeed, there is evidence that asking such questions often leads to group disintegration rather than group success (Tyler and Blader, 2000).

Leadership as Transformation

Recognition of the fact that leadership often appears to rely on leaders and followers rising above their personal self-interest has led to a reemphasis of the role that leader charisma plays in facilitating acts of citizenship, loyalty, and service to the group. This concern is central to models of *transformational leadership*, as evidenced, for example, by the work of James MacGregor Burns (1978). Burns prefaced his work with a stark assessment of the failings of approaches that see

leadership as being primarily about power and resource management rather than influence. True leadership, he contended, arises from *working with* followers and is about much more than simply satisfying their wants and needs in exchange for support. In particular, he suggested that leadership necessarily moves beyond a contractual arrangement whereby people act in particular ways because they feel *obliged* to and, instead, engages with higher-level sensibilities that lead people to pursue a particular course of action because they *want* to, and because they feel that what they are doing is *right*.

Transformational theory expands on these ideas by drawing on motivational and developmental theories which assert that human development involves people's progression from lower-level understandings of themselves and their world (dictated by relatively base urges for things like money) through to more sophisticated higher-level understandings (underpinned by loftier concerns for things like self-actualization and self-esteem). For Burns, a key feature of successful leadership is that it helps people progress up such hierarchies, thereby allowing them to scale greater psychological and moral heights.

Nevertheless, while transformational theory suggests that leadership involves processes of mutual respect and shared perspective, it is worth noting that the psychological theorizing on which it draws assumes that the highest state of motivation and morality is characterized by individual autonomy (Ellemers et al., 2004; Haslam, 2001). This emphasis on the individual is also apparent in practice where, as with classical approaches, measures of transformational leadership (in particular, the *Multifactor Leadership Questionnaire* (MLQ); Bass and Avolio, 1997) focus on the abilities and qualities of the individual leader.

One unique feature of the MLQ is that it is completed not only by individual leaders but also by their superiors, peers, and subordinates (as well as outsiders – e.g., clients). This process of *360 degree feedback* is seen to provide a more valid assessment of the extent to which a leader is charismatic, intelligent, inspirational, and considerate. Indeed, a clear advantage of such procedures over those used by proponents of classical approaches is that they recognize that these characteristics are ultimately conferred by followers rather than simply possessed by leaders themselves (i.e., as argued by Lord and Maher, 1991; Weber, 1921/1946).

Again, though, as with advocates of classical models of old, those who adopt this approach (especially practitioners) often treat these characteristics as fixed and personal rather than dynamic and social. The approach also provides limited insight into the processes that lead to a given leader being seen as having transformational qualities. For example, there appear to be few personal characteristics that people like Mahatma Gandhi, Adolf Hitler, Princess Diana, Nelson Mandela, Margaret Thatcher, and Saint Paul have in common, and which separate them from less charismatic mortals. As we will clarify further below, what they do have in common is the fact that they envisioned, and became emblematic of, particular forms of progress for groups that, at particular points in history, met with some 'success.' Indeed, this latter observation has led researchers like James Meindl (1993) to argue that leadership has much less to do with the character of leaders than with the favorability of the general social environment within which they operate and the romantic attributions to leadership that followers make under these circumstances (for a more radical critique of this form, see Gemmill and Oakley, 1992).

In sum, then, work on transformational leadership makes a strong case for the importance of coming to terms with a leader's transformational capacity, but it sheds relatively little light on the psychological processes that underpin this capacity. It is here that we can turn to insights from the social identity tradition. For here, three decades of research have focused very much on the social psychology of motivation and influence, and on the capacity for this to be transformed by shared group membership.

The New Psychology of Leadership: An Identity Approach

Although it has clear limitations, work in classical and contingency traditions is instructive in a number of ways – most obviously in pointing to the fact that an adequate theory of leadership needs to explain a number of disparate features of this process. At core, these relate to the following four observations:

1. Different forms of leadership are required in different contexts (Fiedler and House, 1994).
2. Followers' perceptions of leaders are all-important (Lord and Maher, 1991), but vary as a function of social context.
3. Leaders and followers have a dynamic capacity to motivate and influence each other (Ellemers et al., 2004; Reicher et al., 2005).
4. In the process of developing the power to change the world, leaders and followers are themselves transformed (Burns, 1978; Turner, 2005).

In striving to develop an analysis that might account for these observations, two further points are worth making that are commonly overlooked. The first is that leaders are never just leaders in the abstract. They are always leaders *of* some specific group or collective – a country, a political party, a sporting team, and so on. By the same token, second, their followers do not come from anywhere. Potentially at least, they too are members of the same group. Leaders and followers are therefore bound together by their being part of – and by their sense that they are part of – a common group.

This idea that leadership centers on individuals' conception of themselves as group members is at the heart of work in the social identity tradition (e.g., see Haslam, 2001; van Knippenberg and Hogg, 2003; Turner, 2005). Social identity refers to a person's sense that he or she is member of a particular social group (e.g., a nation, an organization) and that this group membership is important and meaningful (Tajfel and Turner, 1979). Social identity thus allows people to define the self as 'we' and 'us' (rather than just 'I' and 'me') and to use this is a basis not only for perception but for action (Turner, 1982).

When it comes to leadership, work that has explored the dynamics of social identity makes at least four key contributions to our understanding of this process (Haslam et al., 2011).

First, it shows that when people define themselves in terms of a given group membership, they are motivated to see that in-group as positively distinct from other out-groups, and that here what counts for an individual is not his or her personal fate but the standing of their group as whole (Tajfel and Turner, 1979). Second, it shows that different forms of group behavior stem from different definitions of this social identity (Reicher et al., 2005). In other words, how we behave as a group depends on 'who we think we are.' Third, it shows that social identities are always bound up with social context – depending, among other things, on where we are and who we compare ourselves with (Oakes et al., 1994). Fourth, it shows that social identity is the necessary basis for collective behavior (Turner, 1982). It is only when we define ourselves as members of a common group that we can act as a group.

Leadership as Identity Representation

All of the forgoing points have important implications for the analysis of leadership. Indeed, just as John Turner (1982) asserted that social identity is what makes group behavior possible, so too one can argue that it is social identity that makes both leadership and followership possible (Haslam, 2001; Turner and Haslam, 2001).

This point can be spelled out further by noting that when people define themselves in terms of a given social identity (e.g., as 'us Australians') they seek both to discover what being a member of that group entails (e.g., liking sport, disliking 'tall poppies') and then to act in ways that accord with this (e.g., going to sports matches, deriding high-flyers). But who do we turn to for information about these things? The obvious answer is fellow in-group members. Indeed, one potent way of thinking about leaders is to see them as precisely such people: individuals who are perceived to be qualified to provide information about us and our place in the world by virtue of the fact that they are representative – or, in more technical language, *prototypical* (Turner, 2005) – of groups with which we identify.

These ideas have been supported by a large body of research. In particular, experimental research has shown that leaders who are prototypical of a perceiver's in-group exert more influence over them than those who are nonprototypical (Hogg and van Knippenberg, 2004). Indeed, a consistent finding in this work is that the capacity for a leader to shape the attitudes and behavior of others – in particular, by encouraging original and creative acts of followership – increases to the extent that he or she is seen to be 'one of us' (Haslam and Platow, 2001). Experiments show that it is only when a leader has a history of representing and advancing the interests of a contextually defined in-group, that followers prove willing to 'go the extra mile' in order to turn help translate the leader's vision for the group into reality.

Research by Michael Hogg also shows the influence of prototypical leaders is attributable to their prototypicality rather than the fact that they conform to particular leadership stereotypes (Hogg and van Knippenberg, 2004). In other words, it matters more that a leader looks like 'one of us' than that he or she looks like a 'typical' leader. Indeed, research shows that when stereotypical leader qualities such as trustworthiness, fairness, and charisma predict who emerges as a leader (and who does not), this is because, in the context in which they are studied (i.e., for the particular group in question) these are qualities that are prototypical of the in-group (Haslam et al., 2011).

Extending this point, the programmatic work of Michael Platow also shows that stereotypical leadership qualities like trustworthiness, fairness, and charisma are actually the *consequence* of in-group prototypicality (Platow et al., 2003). It is therefore possible to refine Weber's (1921/1946) claim that leaders' charisma is conferred by followers by observing that this only occurs to the extent that the leaders in question are representative of 'us' (Platow et al., 2006). Refining Meindl's (1993) insights, it also appears that the extent to which followers romantically (mis)attribute group success to the superior quality of leaders is similarly contingent on those leaders' in-group prototypicality (Haslam et al., 2011).

Importantly, too, to the extent that a group member is seen as in-group prototypical, he or she is given greater latitude to display creativity by moving the group in new directions – directions that might otherwise be seen as inappropriate, objectionable, or disloyal (Platow et al., 2006). Yet, by the same token, if aspects of leadership (including the process of appointment) serve to break leaders' ties to their group, then this will tend to undermine their capacity to direct the group effectively. This claim is consistent with evidence that group processes and structures which set leaders apart from the group they are trying to lead tend to undermine both follower support and overall group performance (Hollander, 1985).

Leadership as Identity Realization

The above arguments suggest that a leader's capacity to influence followers flows from his or her capacity to represent a group membership that they both share. But shared identity is not something that is fixed and given. It is also something that can be cultivated (and, for that matter, destroyed). Appreciation of this point leads to the claim that precisely because social identity constitutes such a powerful social force, then anyone who is interested in shaping and changing the world needs to be interested in defining social identity. As Steve Reicher and Nick Hopkins argue (Reicher et al., 2005; Reicher and Hopkins, 1996) leaders thus need to be *entrepreneurs of identity* who work with followers to craft a sense of who they are and what they want to be in ways that make the case for their own relative in-group prototypicality.

One extensive body of work that supports these ideas has involved detailed examination of politicians' speeches to explore the processes through which social identity shapes collective action. One pertinent example is provided by analysis of speeches by leaders of British political parties (Margaret Thatcher and Neil Kinnock) to their respective party conferences during the British miners' strike of 1984–85 (Reicher and Hopkins, 1996). This showed how these speeches served to construe events in such a way that (1) the leader's party could be seen as representative of a positively defined in-group encompassing (almost) the entire population and (2) the leader's policies were consonant with the definition of that in-group identity.

Work of this form shows how identity definition mobilizes followers around a collective vision of identity. Yet however

compelling a vision, and whatever its ability to mobilize in the short-term, vision and rhetoric alone are not enough to sustain followers' faith in social identity in the longer term. For social identity is only useful to the extent that it allows group members to envision and then *create* a better future. Accordingly, if collective mobilization fails to translate the definition of identity into consonant forms of material reality, then that definition – and those leaders who advance it – will fall by the wayside. By contrast, where mobilization does succeed in creating realities that reflect a given definition of identity, then that definition will enjoy increasing support and the leader will receive considerable acclaim. In these terms, then, the X-factor that Gandhi, Hitler, Diana, Mandela, Thatcher, and Paul had in common was that they were effective *identity impresarios* who worked hard to develop structures that allowed the idea of 'us' to be lived out and translated into material change in the world (Haslam et al., 2011).

Conclusion

The forgoing analysis leads us to the conclusion that leadership is a group process that centers on an identity-based relationship between leaders and followers wherein leaders gain effectiveness through an ability to represent and realize the meaning and aspirations of the group. On the one hand, this acts as a constraint upon leaders. Leaders cannot say anything or get followers to do anything. They are reliant on their ability to persuade followers of their prototypicality and normativity, and this in turn depends upon features of social context. But on the other hand, it is social identity that enables leaders to energize people with their vision, and to recruit the agency of followers in order to transform both their self-understanding and the world they inhabit (Haslam et al., 2011; Reicher et al., 2005).

Leaders, followers, and situations are not static elements that exist and operate independently of each other. Rather, they interact to shape each other. Moreover, it is through this dynamic interaction – and the process of galvanizing a collection of disparate 'I's into a powerful world-changing 'we' – that the transformational power of leadership is generated. Ironically, too, it is also in this process that the seductive myths of leadership come to the fore and prove to be its undoing. For once they have changed the world by mobilizing the power of the group, there is great temptation (and considerable inducement) for leaders to fall back on classical models which lead them to imagine that this was all their own doing. Airport bookshelves heave under the weight of such hubris and beckon us to our ruin.

Abstract

Leadership theory has evolved from an emphasis on traits and behavioral styles, to the more interactive theories associated with contingency theory, transactional and transformational leadership, and the emerging areas of servant leadership and shared leadership. The implication of evolving leadership theory for the education and development of leaders is explored as well as the methods commonly associated with developing leaders. Methodological issues related to research on leadership education and emerging areas related to developing leaders are also discussed.

Introduction

Developing effective leaders is one of society's most critical tasks, and one that directly affects the well-being, productivity, and sustainability of the organizations and societies in which we live. As such, it is important to understand how leaders can be best prepared to effectively deal with current and future challenges. Business, government, military, educational institutions, and not-for-profit organizations all require effective leaders to function well and serve the needs of their various constituencies. Today's modern organizations are characterized by rapid change and increasing complexity, which makes the need for effective leadership even more acute. Thousands of studies on leadership, various definitions of leadership, and theories of leadership development have made the field of leadership studies a complex one (Bass, 2008; Yukl, 2012).

According to a survey of Human Resource (HR) leaders, the number one problem for HR directors is identifying and developing the leadership talent needed for growth and expansion of their respective organizations (Fegley, 2006). Organizations have made leadership development a top priority in terms of education and training. In fact, 2012 saw an estimated increase of 14% in spending on leadership development in the United States, bringing annual spending to more than 13 000 000 000 dollars (O' Leonard and Loew, 2012). However, even with the substantial amount of money and resources allocated to leadership development, organizations and stakeholders often complain about the lack of effective leaders as well as the efficacy of leadership development efforts to bring about meaningful improvement in leadership capability. Moreover, the consequences of ineffective leadership reverberate across all spheres of society, leading many to question the motives, ethics, and capability of today's leaders. High-profile scandals involving business leaders, government officials, and leaders in various other domains has put a renewed emphasis on ethics and corporate social responsibility and has generally revitalized the debate on how best to educate and develop leaders (Ghoshal, 2005).

Evolving Definitions and Theories of Leadership

According to Yukl (2012), "Leadership is the process of influencing others to understand and agree about what needs to be done and how to do it, and the process of facilitating individual and collective efforts to accomplish shared objectives." Bennis (2009) defined leadership as "… a function of knowing yourself, having a vision that is well communicated, building trust among colleagues, and taking effective action to realize your own leadership potential." While definitions of leadership vary among authors and scholars, all tend to agree that the process of leadership involves the ability to influence, motivate, and enable others toward achieving goals important to the group(s) to which they are members. Even though agreement might be found on this general definition, how to conceptualize leaders and how they go about the leadership role has evolved over time. These evolving conceptualizations have had direct implications for how leadership education has been framed and implemented.

Interest in more scientific leadership research started in the early part of the twentieth century with trait and 'great man' theories of leadership (Borgatta et al., 1954), which typically viewed leadership as an inborn quality of individuals. Early trait theories of leadership assumed effective leaders can be defined by a set of traits and abilities that they possess that nonleaders or ineffective leaders do not. More recent meta-analytic studies of personality have found extraversion, openness to experience, conscientiousness, and neuroticism/emotional stability to be related to leader emergence and leadership effectiveness, with extraversion being the factor with the most consistent relationship (Judge et al., 2002; Bono and Judge, 2004). This is most likely due to the tendency of extroverts to convey more positive emotions and optimism as well as their tendency to be energized by group settings. Meta-analytic studies of cognitive intelligence (Judge et al., 2004) have also shown a correlation with leadership, but in the words of the authors, "… results suggest that the relationship between intelligence and leadership is considerably lower than previously thought." Even when personality traits and intelligence are taken into account, what seems clear is that understanding leadership requires additional constructs to provide a more complete picture of leadership effectiveness.

Research on leadership effectiveness conducted at Ohio State University in the 1940s (Hemphill and Coons, 1950) and Michigan State University in the 1950s (Katz et al., 1950) began a research tradition often referred to as the behavioral approach to leadership which, instead of focusing on traits, focused on the specific behaviors associated with leadership. Key findings

from the Ohio State University studies were the dimensions of 'consideration' and 'initiating structure.' Consideration is the degree to which the leader is concerned with the welfare of group members and 'initiating structure' is the leader's concern for roles, actions, and how to organize activities so that tasks are accomplished by the groups they lead. Studies at Michigan State University in the 1950s had similar findings but also identified a construct labeled participative leadership. This represented an extension of leadership theory by viewing leadership as more of a process of mutual influence by which the leader seeks out and values the input and contribution of followers. Occurring in the historical context of the growing influence of behaviorism in psychology more generally, these theories differed from trait theories in that they sought to understand the specific behaviors of effective leaders; behaviors which could then be taught to current or prospective leaders.

As theory and research progressed, a move to incorporate characteristics of followers, and the environment in which the leader is embedded, started to become more salient. The 1960s and 1970s found interest emerging in contingency theories of leadership, which held that there was no one 'right' way to lead, but that leadership effectiveness depends on matching leaders to situations in which they were likely, because of their natural dispositions, to be successful. The contingency theory of leadership by Fiedler (1967) posited that leaders will excel if their leadership style matches the dimensions of the situation. However, a leader's style was not viewed by Fiedler as particularly malleable or adaptable. An alternative contingency approach to leadership can be seen in the situational leadership model (Hersey and Blanchard, 1969), which posits that leaders can be taught to diagnose specific aspects of the leadership situation (e.g., follower needs or readiness to engage in specific tasks) and modify their leadership behavior to a delegating, supporting, coaching, or directing style based on the situation. Like behavioral theories, skills such as assessing the needs of followers, as well as the specific behaviors associated with specific styles, represent knowledge and skills that could be transferred to leaders through training.

The 1970s saw the rise of transactional theories of leadership, which held that leaders motivate employees by providing sought after rewards for members to engage in behavior consistent with the leader's agenda and threats or punishments for poor performance. More recent research and theory have focused on transformational leadership, which is a leadership style defined by a dynamic interchange between leader and followers in which each challenges the other to higher aspirations. This leadership style tends to be characterized as a more visionary and charismatic style less reliant on the reciprocity characteristic of transactional forms of leadership. In this way, the leader appeals to higher level needs, aspirations, and expectations of followers. Transformational leadership has been operationalized into (1) idealized influence, in which the leader is seen as a role model, is authentic, trustworthy, and highly credible; (2) inspirational motivation, in which the leader provides a shared vision meaningful to followers and works to simplify complex ideas and problems; (3) individualized consideration, in which the leader appreciates the individuality of followers while treating them equally and developing them to higher levels of potential; and (4) intellectual stimulation, in which the leader encourages followers to question their old way of doing things and to break with the past. These facets of the transformational leadership model can be measured with the Multifactor Leadership Questionnaire (Bass and Avolio, 2000) and provides a specific framework of leadership capabilities that can be measured and taught.

The leader's motivational profile has also been put forward as a useful construct to better understand what drives specific behavioral patterns. The social motives of achievement, affiliation, and power, originally conceptualized by McClelland as on-going needs, wants, or concerns that drive patterns of thoughts and behaviors, have also been linked to leadership (McClelland and Boyatzis, 1982). The social motives are believed to operate at the unconscious level, meaning that most people likely have very little insight into their motive profile. The position that leadership behavior, like other forms of behavior, is partially determined and driven by forces outside of conscious awareness has been held by other leadership scholars as well (cf Kets de Vries, 2006). Research on the need for achievement, defined as a need to surpass a standard of excellence and need for power, defined as the need to have impact on others, have both been linked to effective management/leadership (McClelland and Boyatzis, 1982). The affiliation motive, defined as a need to establish, maintain, or restore harmonious relationship with others, was found to be lower than both achievement and power motives in more effective leaders.

Building on a theory of social motives, a theory of competencies, now referred to as the behavioral approach to emotional intelligence (EI) (Boyatzis, 2009), began to emerge from applied research on distinguishing characteristics of average vs effective leaders (Spencer and Spencer, 1993). The social motives are viewed as driving the frequency and intrinsic satisfaction derived from engaging in specific leadership behaviors associated with a given competency. While the social motives can be viewed as a trait, arousal of a given motive by factors in the environment may increase the frequency of specific behavioral manifestations of the motive. For example, when a leader's power motive is aroused, he or she is more likely to demonstrate behaviors associated with competencies such as influence or inspirational leadership. Also influencing, behavioral expression of specific competencies are the leader's values and self-image. The competency-based approach has implications for developing leaders by pointing to a more complex interplay between intentional behaviors driven by forces below conscious control and moderated by personal values and the leader's self-image. This research line contributed to a growing realization that developing one's capacity as a leader required a more complex approach than simply imparting knowledge, skills, and abilities. For leadership development to be truly transformational, it requires that leaders explore their identity as a leader, their values, and their future goals and aspirations.

The transformation of motives and personality traits of leaders has been challenged by many as these constructs have traditionally been viewed as more fixed and static in adults. This has given rise to questions about the efficacy of attempting to change these constructs through leadership development initiatives targeted at adults. The belief that leaders are born is one, which has stimulated several studies that have attempted to better understand the role of genetics in understanding both

personality and leadership. While personality traits have a significant genetic component, behavioral-genetic research on complex behavioral traits leaves much of the variability in personality traits unexplained. A review of this research by Plomin and Daniels (1987) concluded that it is rare for any study to find genetic evidence to account for more than half of the variance in complex behavioral traits. Genetic research aimed at predicting who ends up in leadership roles does not only demonstrate a significant relationship between genetics and leader emergence (De Neve et al., 2013), but also makes clear that other factors are needed to more fully explain leader emergence. Moreover, recent research also provides evidence that personality traits continue to change in adulthood and that these changes may be quite substantial and consequential (Roberts and Mroczek, 2008). The limited explanatory power of genetic explanations of leadership, combined with questions about the fixed nature of personality traits, calls into questions about the deterministic notions of who can and cannot become a leader.

While genetic and trait-based explanations may provide some insight into leader emergence, leader effectiveness once in the leadership role might be better explained by a leader's developmental history and experiences. Ligon et al. (2008) researched the life histories of 120 outstanding historical leaders and reported that more positive and constructive leaders had experienced life events that had firmly established positive personal beliefs and values early in their life span. The opposite was found for more destructive or selfish leaders, which tended to have experienced more negative events early in their development. The experience of such events likely influence one's narrative identity, defined as an internalized and evolving life story from which individuals seek to give meaning and purpose to significant life experiences (McAdams and Olson, 2010). The fact that narratives evolve overtime, and are subject to modification through different experiences and subsequent interpretation provides support for many leadership development practices. Understanding the leader's life in context and the practice of encouraging leaders to focus on the construction of a future vision, help leaders better understand their life context, and shape their future development plans. The importance of a personal vision is integral to many contemporary theories and practices related to leadership development.

Leadership theories reviewed up to this point tend to assume a more hierarchical, or vertical model of leadership. However, the realities of modern organizations have prompted us to view leadership as a shared or reciprocal process among team members. Pearce and Conger (2003) define shared leadership as "a dynamic, interactive influence process among individuals in groups for which the objective is to lead one another to the achievement of group or organizational goals or both. This influence process often involves peer, or lateral, influence and at other times involves upward or downward hierarchical influence." The framing of leadership as shared, in the context of changing authority dynamics, requires a fundamental shift in how leaders think about their role. Preparing leaders to operate within less formal hierarchies in which they may need to play the role of leader, peer, and subordinate all in the same meeting requires developing leaders with flexible influence and collaborative skills. Additional implications of shared leadership theories for leadership education include the need for action learning that requires teams to work on actual or simulated problems/projects without assigning a formal leader. Training, simulations, or developmental assignments that require leaders to assume multiple roles and to exercise influence in situations where they do not have formal authority should prove useful in developing the skills necessary to work effectively in situations, which require shared leadership.

A competing leadership theory is servant leadership, which was originally coined by Greenleaf (1991) but has been reinterpreted and expanded since its original conceptualization. A literature review by Russell and Stone (2002) found that servant leadership can be understood in terms of functional attributes of servant leaders, which include having a vision, being honest, trustworthy, service oriented, a role model, demonstrating appreciation of others' service, and empowerment. In relation to abilities and competencies, servant leaders are characterized as good communicators and listeners, credible, competent, encouraging of others, teachers, and delegators. In contrast to other theories of leadership, which tend to assume that the leader is primarily focused on achieving organizational goals, servant leaders are assumed to prioritize the needs of followers, with organizational objectives taking a secondary role. The conceptualization of servant leadership suggests that development of the associated attributes and competencies could be accomplished through service-learning projects that encourage learners to address issues outside their immediate organizational environment. Servant leadership makes an explicit link between leadership, ethics, and prosocial behavior, and defines a leader's contribution as measured by their impact on consumers, employees, communities, and a more widely defined network of stakeholders. This way of defining leadership corresponds well with contemporary notions of corporate social responsibility, which have now become more visible in business school curriculums. The increased use of service-learning programs both in university-based programs and other organizations throughout the world can partially be attributed to a rise in the popularity of servant leadership as a theory of leadership (**Table 1**).

Can Leadership Be Taught and Developed?

While theories of leadership vary, and tend to emphasize different knowledge, skills, abilities, and values, programs designed to enhance a leader's effectiveness also differ significantly in terms of structure, content, and approach. Given the wide swath of programs that fall within the leadership education paradigm, it should not be surprising that the return on time and money invested in leadership development can vary dramatically (Burke and Day, 1986; Collins and Holton, 2004; Avolio et al., 2009, 2010). While a comprehensive and accepted theory related to leadership development remains elusive, compelling evidence suggests that leaders can be educated to be more effective.

Research on job performance has demonstrated that job performance varies as a function of job complexity such that the more complex the job, the more performance variability there will be among individuals holding that job (Hunter et al., 1990). Leaders often have to deal with multiple levels of complexity and

Table 1 Summary of leadership theories

Leadership theory	*Time period*	*Implications for leadership education*	*Selected references*
'Great man' theories	Early twentieth century	Leadership cannot be developed because it was seen as an inborn quality	Borgatta et al. (1954)
Behavioral approach to leadership as a process of mutual influence	Mid-twentieth century	Focus on teaching leaders specific behaviors associated with leadership	Hemphill and Coons (1950) Katz et al. (1950)
Contingency theories including situational leadership model	1960s and 1970s	Focus on teaching leaders to diagnose specific situations and follower needs in order to use adequate leadership style	Fiedler (1967) Hersey and Blanchard (1969)
Transactional leadership theory	1970s	Teaching leaders to understand what motivates employees in order to provide adequate rewards or punishments	Bass (2008)
Transformational leadership theory	1980s and onward	Focus on teaching leaders how to be a role model, inspire with a shared vision, appreciate individuality of followers, and stimulate them intellectually	Bass and Avolio (2000)
Shared leadership theories	1990s and onward	Less-defined hierarchies require leaders to develop flexible influence and collaborative skills. Action learning offers an adequate framework as leaders usually work in teams on actual problems without formally assigned leadership roles	Pearce and Conger (2003)
Servant leadership	1990s and onward	Leadership education involves service-learning projects, which encourage learners to address issues outside their immediate organizational environment with a focus on the needs of employees, consumers, communities, and other stakeholders	Greenleaf (1991) Stone et al. (2004)
Social motives and competencies	1970s and onward	Intrinsic social motives impact the frequency of specific behaviors associated with different competencies. Leadership education has to allow leaders to explore their identities, values, and future goals and aspirations	Boyatzis (1982) McClelland (1987) Spencer and Spencer (1993)
Individual developmental history and experiences	Twenty-first century	Leadership development practices focus on one's understanding of life in context, interpreting life narratives and modifying them through positive experiences as well as constructing a future vision	Ligon et al. (2008) McAdams and Olson (2010)

lead others through ambiguous situations fraught with varying levels of risk, making leadership roles highly variable in terms of performance. Given the large variability in leadership performance, understanding the specific leadership competencies that account for variance in measurable organizational outcomes can help to focus leadership development efforts on specific competencies linked to specific organizational outcomes identified through applied research on high performing leaders (Ryan et al., 2009). An evaluation of a leadership development program, which was customized to develop specific competencies, identified through applied research, demonstrated favorable return on investment when business unit profitabilities of trained leaders were compared with a control group of untrained leaders in the same organization (Spencer, 2001). Moreover, the potential for training effects of leadership development to 'cascade' down through the organization also provides a mechanism by which the Return on Investment (ROI) of training leaders may potentially be magnified.

While the potential for significant, measurable impact from leadership development is great, systematic investigations of leadership development interventions are somewhat rare in the literature as are theories of leadership development. Nonetheless, several research studies and program evaluations have shown that leadership development interventions can have a positive effect on the attitudes, behaviors, and performance of leaders and their followers (Avolio et al., 2010). The first formal meta-analysis of managerial and leadership development initiatives conducted by Burke and Day (1986) analyzed studies published from 1952 to 1982 and found such interventions to be moderately effective. Collins and Holton (2004) extended and updated the previous study by conducting a meta-analysis on 83 intervention studies published between 1982 and 2001 and found moderate to strong effect sizes. Another meta-analysis also showed that the majority of leadership development initiatives both in laboratory and field settings have a positive impact, but this effect varies dramatically based on the type of intervention and the specific theory, which guided the design and implementation of the program (Avolio et al., 2009).

While research has been generally supportive of the positive effects of leadership development initiatives, some significant methodological issues have to be considered. Evaluations of leadership development programs typically focus on one or two specific leadership tasks or skills, for example, communication methods such as discussing performance problems constructively, motivation, or participative problem-solving techniques. Given the complexities associated with the leadership role, it is unlikely that these types of isolated interventions match the desire of organizational stakeholders to develop more capable leaders. Moreover, research that evaluates leadership development tends to be more focused on immediate or short-term outcomes, yet those sponsoring and participating in leadership development initiatives likely expect the effects of such interventions to be more long term.

Though not unique to leadership theory and practice, the wide range of leadership definitions poses a significant methodological challenge to research on leadership education. To test any substantive hypothesis related to leadership, the meanings of variables involved must be specified in observational terms and a method established for how they can be measured. However, as Bass (2008) points out, "There are almost as many definitions of leadership as there are persons who have attempted to define the concept." As a consequence, generalization about the effectiveness of leadership development becomes problematic, as does the implication of leadership development research for practice. The multiple settings and different populations, which regularly engage in leadership education also introduces unique factors that limit the development of a general theory of leadership development.

Venues traditionally associated with educating leaders have been business schools and universities. While interest in leadership education within university settings has been growing, compelling evidence of the effectiveness of such university-based programs has been elusive, causing many to question the utility of such programs. A notable exception is the competency-based MBA program at the Weatherhead School of Management (WSOM) at Case Western Reserve University (Boyatzis et al., 1994). Longitudinal studies at WSOM have demonstrated that MBA students can improve the emotional, social, and cognitive intelligence competencies that distinguish outstanding leaders and that improvements can be maintained for several years after program completion. The program at WSOM along with 14 other programs were identified as model programs by the Consortium for Research on Emotional Intelligence in Organizations (www.eiconsortium.org) due to evaluation data, which demonstrated that these programs had a measurable impact on social and emotional competencies and/or organizational outcomes. Based on model program evaluation, expert panels and applied research, 22 guidelines for best practice were established and now provide a comprehensive framework for developing social and EI competencies in adults (Cherniss et al., 1998).

While universities would seem a natural choice of venue for the education of leaders, critics both outside and inside academia have questioned this assumption. Mintzberg (2004) in his influential book *Managers not MBAs* argued that several factors work against the development of effective managers in traditional MBA programs and that managing is a practice that cannot be taught in a traditional classroom setting. He argues that teaching theories of management to nonpracticing managers is ineffective as they have a limited amount of relevant experience that can be related to what is being taught. Training in management and leadership should be limited to practicing managers and efforts made to leverage the knowledge and experience of those managers and share with them theories, which help them make sense of their current reality. Sharing of experience, self-reflection, and the necessity of application and experimentation of management theories back on the job lead to the transfer of theories into the practice of effective management and leadership.

Theory and Practices Related to Developing Leaders

Early practice related to developing leaders relied on the state of theory at the time. As such, earlier attempts to develop leadership relied more heavily on trying to teach theory and specific behaviors thought to be associated with effective leadership. Perhaps the biggest shift in educating leaders is to reframe

the process of leadership education from isolated training events to a learning process with various stages and that involves multiple training and development strategies in addition to traditional classroom-based training. Issues related to the formation of the person's identity as a leader, self-awareness, self-exploration, developmental readiness, motivation to change, the role of the leader's life experiences, and social environment have all begun to take a more central role in theory and practice related to developing leaders.

An example of viewing leadership development as a process can be seen in the more recent emphasis on understanding, and in some cases trying to enhance, a leader's readiness to engage in and benefit from leadership education. Developmental readiness is related to concepts previously identified in the training literature such as 'learner readiness' (Holton et al., 2000) or 'trainability' (Noe and Schmitt, 1986) but differs somewhat from these constructs in that developmental readiness goes beyond readiness to acquire more basic knowledge and skills and is related to a willingness to expand one's overall capacity and develop aspects of one's identity and social and emotional competencies associated with leadership. A review of the literature in clinical psychology suggests that the readiness of the individual to engage in therapy is likely more important than either the therapist or specific therapeutic technique employed (Avolio and Hannah, 2008). Given the transformative nature of many leadership development initiatives, such programs require individuals be ready to engage in a process that is essentially about a 'metamorphosis in actions, habits, or competencies associated with leadership effectiveness' (Boyatzis, 2008).

While individual level constructs are key to developmental readiness, the organizational climate must also be perceived as psychologically safe and supportive to facilitating transfer of training. Research on leadership training dating back to the 1950s (Fleishman, 1953) demonstrated that trainees that were trained to adopt a more supportive leadership style were only able to transfer this style to their role if their own supervisor had a similar leadership style.

Intentional change theory (ICT) (Boyatzis, 2006) explicitly addresses issues related to increasing motivation to engage in the developmental process as well as aspects of the social context in which leadership development occurs. In ICT, development is seen as an integrated process by which first individuals develop a clear longer term vision of their life and the leadership role(s) they would like to aspire to. This future vision of one's ideal self is then compared against one's current state in terms of competencies, values, and traits. This current state is referred to as the real self. Aspects of the real self are often assessed through tools such as multirater feedback, psychometric assessments of personality variables and values, or assessment center methodologies and simulations. Comparing one's future ideal self with the current real self motivates leaders to work to reduce the difference between the two selves and thus bring themselves more in line with their ideal self. Development of a detailed vision of one's ideal self is of critical importance as it helps to provide an emotionally engaging, positively framed ideal to which the leader can aspire. Without a clear and emotionally engaging future vision, motivation to develop will be limited and the ability of the learner to persist in the face of obstacles and setbacks related to their development will be reduced.

According to ICT, once the ideal and real selves have been defined, only then does one start to set learning goals and to work on a learning plan, which could include traditional skill-building courses (e.g., presentation skills), developmental assignments, which require a person display and practice specific competencies, individual coaching, and/or mentoring. With the plan completed, often with the help of a coach or mentor, the leader begins to implement their learning plan and begins to practice and experiment with new behaviors and competencies. In ICT, development is seen as a circular process in which the leader again returns to the question of their personal vision. Meaning that as one develops greater capacity and achieves one's developmental goals, thus bringing one closer to one's ideal self as articulated in their personal vision, a revised vision is often needed given the individual's changing role, career stage or life circumstances. Also central to ICT is the role of resonant relationships characterized by trust, support, and a positive emotional connection, which serve to provide encouragement, feedback, and advice to aid the leader in the pursuit of their development goals. Consistent with contemporary thinking on adult learning, the specific development goals are achieved primarily through experiential learning techniques.

The experiential learning theory of Kolb (1984) builds on earlier theories, which emphasized the role of experience in learning. Experiential learning theory defines learning as "the process whereby knowledge is created through the transformation of experience. Knowledge results from the combination of grasping and transforming experience" (Kolb, 1984). In this way, cognitive, affective (emotional), and behavioral systems are all engaged as part of an initial experience, which are later reflected on and incorporated in the form of new knowledge, skills, and abilities. Researchers from the Center for Creative Leadership have suggested that 70% of leadership development is accomplished through experience on the job (e.g., developmental assignments), 20% is accomplished through the social effects of mentoring, coaching, and shadowing role models that demonstrate specific leadership competencies and 10% through attending formal courses or reading about specific leadership topics (Lombardo and Eichinger, 2000). The emphasis on multiple learning methodologies offers the learner a diverse experience and is generally consistent with current thinking in leadership education about the need to provide training using multiple methods to appeal to people with different learning styles.

Developmental assignments expose leaders to new and novel experiences that can work to enhance personal development and build leadership capacity. Often developmental assignments broaden the current role of a person within the same organization. Such assignments can also be a valuable method to develop leadership competencies through collaboration in practical projects outside one's current role. Service learning can be seen as a specific type of developmental assignment, and is often applied in educational settings with the objective of developing specific leadership skills and competencies. Such assignments commonly revolve around activities that address human and community needs,

promoting ethical and socially responsible behavior in participants (Dumas, 2002). Though more common in academic settings, companies have started to discover these types of collaborations as meaningful opportunities to enhance leadership skills within their in-company development programs. The 'Ulysses Program' has leaders participate in an 8-week collaboration project with social entrepreneurs, companies, or NGOs. Combined with individual assessment, coaching, and team building, this international field experience allows participants to develop in concepts like responsible mind-set, ethical literacy, cultural intelligence, global mind-set, self-development, and community building (Pless et al., 2011). Service-learning assignments in higher education and corporate settings have been employed, in part, as a response to calls for leadership education interventions, which specifically seek to develop business ethics and corporate social responsibility along with other leadership competencies.

The use of leadership coaches in conjunction with leadership development programs has expanded dramatically in the last 20 years. The Center for Creative Leadership (Ting and Hart, 2004) defines coaching as a formal one-on-one relationship, "in which the coachee and coach collaborate to assess and understand the coachee and his or her leadership developmental tasks, to challenge current constraints while exploring new possibilities, and to ensure accountability and support for reaching goals and sustaining development." Leadership coaching tends to be an individualized process developed to meet the unique needs, characteristics, and experiences of the coachee taking into account the needs of the organization in which the coachee is a member. Leaders engage in coaching to address a wide variety of needs, which may include a desire to increase self-awareness, develop specific leadership competencies, career transition issues, or to seek insight and perspectives on current or future challenges. The diversity of coaching approaches, and issues addressed by coaches in relation to leadership development, has made research into the coaching process and outcomes difficult. As a result, empirical research on coaching outcomes is currently limited to a handful of studies, many of which suffer serious methodological issues. Like other areas of leadership education, coaching is an area that could benefit from additional research to better understand how it impacts specific facets of leadership and leads to valued outcomes.

Formal and informal mentoring programs have also become more prevalent over the last 20 years and represent a more customized and context sensitive approach to educating and developing leaders. In contrast to coaching, where the relationship is built with an external professional, mentoring is based on a relationship linked to a more senior person within the same organization but outside the direct reporting line (McCauley and Douglas, 1998). Mentors help their mentees by supporting them with organizational understanding and creating a network that will be useful to the mentee's career advancement. The opportunity to observe and seek feedback and practical advice on current and future leadership challenges makes mentoring a useful form of relational learning for leaders. Moreover, the nature of learning in mentoring relationships is two way, meaning that both enter into the relationship expecting to be both expert and learner, to give and receive feedback, and enable and be enabled (Kram and Cherniss, 2001).

Leaders operating in today's more globalized environment are required to deal with a level of complexity and interconnection not previously seen. International and intercultural work has become the norm for large companies as well as a growing number of small- and medium-sized enterprises. Advances in technology has facilitated collaboration across international borders and heightened the need for leaders to develop their cultural intelligence. In terms of leadership education in university settings, this has often meant the opening of satellite extensions in different countries, international partnerships, and research collaborations intended to expose students and leaders to a diversity of cultural perspectives. The structure of many university-based programs now encourages students to work in cross-cultural project teams. More traditional approaches to developing the cultural intelligence of leaders have been to educate leaders about different cultural values and norms from the work of anthropologists and cross-cultural psychologists.

Emerging Trends in Leadership Education

Recent research and theory from psychology, neuroscience, organizational behavior, and corporate social responsibility are currently influencing trends in leadership education. The positive psychology movement and strength-based approaches to leadership have been emerging and exerting an influence on the practice of leadership education. In contrast to the 'disease model of human nature' that had dominated the last century of theory and practice within psychology, positive psychology seeks to understand what allows people to flourish and thrive. The role of positive emotions on learning, developing, and relationship building also represents a contribution of this emerging area to leadership education. An example of this can be seen in Fredrickson's (2001) broaden-and-build theory, which assumes that a key function of positive emotions is to encourage the broadening and building of social networks and open people to the possibility of developing new skills. According to Fredrickson, positive affective states could provide leaders with more positive psychological resources that they can draw on to support development. A trend to focus on a leader's current strengths and how these might be leveraged and used to overcome or compensate for weaknesses provides a different lens through which to view leadership development.

Theory related to EI has also begun to exert an influence in leadership theory and education. EI has been defined by Mayer et al. (2004) as "… the capacity to reason about emotions, and of emotions to enhance thinking as well as abilities to accurately perceive emotions, to access and generate emotions so as to assist thought, to understand emotions and emotional knowledge, and to reflectively regulate emotions so as to promote emotional and intellectual growth." Building on this definition and linking EI to a theory of work performance, Boyatzis (2009) defined a behavioral approach to EI as "… an ability to recognize, understand, and use emotional information about oneself that leads to or causes effective or superior performance." Given that emotions are a critical factor in

creating and sustaining motivation that makes the intelligent use of emotions an important leadership task. Competency in the area of empathy and emotional management should help leaders develop and communicate their visions and help them establish an emotional bond with followers. Moreover, the intelligent use of emotions also seems important to allow leaders to cope with the potentially distressing emotions associated with personal change, as well as permitting the leader to stay open to and learn from the emotional experiences inherent in more experiential methods of leadership development.

Emotion-related processes have historically been absent from most theories and models of leadership. The integration of emotional processes into leadership and management theory has provided a more complete picture of how leaders go about motivating and engaging those around them. Key findings from affective neuroscience have also begun to influence theory and practice related to leadership development. How leaders affect the emotions of followers and how emotional process works to build rapport and resonant relationships with followers is being informed by neuroscience. The concept of resonance has its neurophysiological underpinnings in neurons in the brain referred to as mirror cells (Rizzolatti et al., 2001). These cells are widely dispersed in areas of the brain and lead us to mimic and mirror the feelings and behaviors of others. The process of emotional contagion, characterized as processes that allow the sharing or transferring of emotions from one individual to another, often occurs without conscious knowledge (Barsade and Gibson, 2010). Research on leaders and emotional contagion has found the leader's positive mood, had a subsequent influence on group coordination and effort (Sy et al., 2005). Neurological research has also begun to understand the dynamic neurological underpinnings of concepts such as transformational leadership mechanisms that may underpin the leadership qualities of individuals (Balthazard et al., 2012). Moral reasoning and decision making has become an interesting area for affective neuroscience. Though research on neuroscience and leadership is in the early stages, this research could potentially see neurological assessment used to compliment more traditional leadership assessment for use in leadership development.

E-leadership and virtual teams is also emerging as an important issue for both research and practice related to leadership as the nature of virtual work teams continues to expand and evolve. Survey research has shown that areas that tend to be addressed related to the leadership of virtual teams includes leading virtual team meetings, coaching and mentoring team members virtually, developing trust in a virtual environment, as well as how to monitor performance and deal with performance issues virtually (Rosen et al., 2006; Malhotra et al., 2007). While research is increasing in this area, few program evaluation studies on the effects of specific training content or methodologies have been conducted. However, research has shown that virtual teams that perceived themselves to have more of a shared leadership model, vs a more traditional hierarchical model, had higher levels of performance (Hoch and Kozlowski, 2012). As technology continues to advance and globalization continues, it is likely that leading virtual teams will become even more relevant for leaders in the future.

The topic of leadership and leadership education will continue to hold the attention of both scholars and the general public for the foreseeable future. Determining the conditions and practices that must exist to meaningfully enhance leadership capability should continue to drive research on leadership education. What is certain is that that the landscape in which leaders operate will continue to change, yet the need for leaders to effectively motivate and inspire others will not.

Abstract

This article updates an entry made in the first edition of the Encyclopedia (2001). It maintains the same structure by opening with a discussion on the definitional confusion among researchers of leadership – a confusion grounded in the fact that leadership can be looked at either a property (the position of the 'personalists') or a process (the position of their opponents, the 'situationists'). A number of influential leadership theories are examined, including theories that emphasize the importance of traits, behaviors, contingency, attribution, and symbolism. Charismatic and transformational leaderships are reviewed. Attention is given to the importance of the clinical paradigm in leadership research. Finally, we revisit developments in leadership studies since the first edition of the Encyclopedia a decade ago and propose emerging areas of research.

A Definitional Confusion

The Anglo-Saxon etymological origin of the words lead, leader, and leadership is *laed*, which stands for 'path' or 'road.' The verb *laeden* means 'to travel.' Thus a leader is one who shows fellow travelers the way by walking ahead. This metaphor of the leader as helmsman is still very much on the mark. Unfortunately, the clarity of leadership's etymology is rarely matched with clarity of meaning. When we plunge into the organizational literature on leadership, we quickly become lost in a labyrinth: there are endless definitions, countless articles, and never ending polemics. Papers, books, and articles claiming to delineate leadership proliferate, yet their conclusions can be confusing and even conflicting.

The most recent handbooks on leadership (Bass and Bass, 2008; Bryman et al., 2011) demonstrate the richness of leadership studies in their multiplicity of perspectives (social, psychological, historical, political, cultural, and even military) and approaches (theoretical, empirical, interdisciplinary, and policy-centered). Among the more popular are descriptions in terms of traits, behavior, relationships, and follower perceptions. Prevalent themes in the last decade include personality-based approaches, contingency theories, transformational leadership, leader-followership, innovation and creativity, the role of emotions, and the shadow side of leadership. More recently, with the financial crisis that began in 2008 and the poignancy of a number of high-profile corporate scandals, the nature and integrity of leadership practices have also come under the spotlight. The number of academic journals partially or fully devoted to the study of leadership continues to increase (*Leadership Quarterly*, *Leadership*, *Journal of Leadership Studies*, *International Journal of Leadership Studies*, *Journal of Leadership and Organizational Studies*, to name a prominent few) reflecting the diverse and creative discourse on leadership study, as have the number of practitioner or commercial books on leadership, indicating popular interest in the subject.

We continue to see a continued movement away from laboratory experiments, observations of leaderless groups, or the activities of lower level supervisors toward what leaders at a higher level are doing in the context of their work environment. In *Harvard Business Review's 10 Must Reads on Leadership* (2011), all of which include case studies with CEOs and top executives, the opinion on what makes a great leader may vary, but the authors generally agree that leadership is not a gift inherent to a chosen few, but something which can be cultivated. This includes fine-tuning one's emotional intelligence, implementing key leadership behaviors, adopting effective strategies for adapting to crisis and leading through change, the ability to find meaning and to learn from extremely difficult events, and practicing authenticity.

While much progress has been made, the proliferation of studies has only generated more questions. The observations and profiles of actual leaders show a theatrical gamut of personalities, attributes, strengths, and weaknesses, with different contexts calling for different leadership styles. A review by Yammarino et al. (2005) cited in Crossan and Mazutis (2008) identified at minimum 17 different leadership theories, providing effectiveness remedies ranging from classical approaches to more contemporary forms such as charismatic and transformational leadership. However, this review precludes more recent streams of leadership studies in areas such as strategic leadership or shared leadership or more positive forms such as authentic, spiritual, ethical, or responsible leadership. While we continue to broaden our understanding on leadership, great leadership, while consisting of many teachable components, remains illusive.

A Proliferation of Theories

Broadly speaking, two extreme positions can be identified in leadership research. On one side of the spectrum are the 'personalists' – researchers who argue that specific personality variables determine leadership effectiveness. On the other side of the spectrum are the 'situationists' – those who deny the influence of individual differences and attribute all variations in leadership effectiveness to environmental constraints. While personalists view leaders as heroic helmsmen, in control of whatever situation they find themselves, situationists turn leaders into figureheads – puppets manipulated by the forces of the environment.

These opposing positions set the stage for a cornucopia of theories, each backed by strong defenders. We can find 'great man' theories, trait theories, situational theories, psychoanalytic theories, political theories, humanistic theories, cognitive theories, leader-role theories, reinforced change theories, path-goal theories, contingency theories, multiple linkage theories, vertical dyad linkage theories, exchange theories, behavioral theories, and attribution theories. This lack of apparent convergence has caused some scholars to abandon the subject altogether.

One of the problems in dealing with the subject of leadership is that it can be looked at as both a property and a process. As a property, leadership is seen as a set of characteristics – role behaviors and personality attributes – that make certain people more effective in attaining a set of goals. As a process, it is seen as an effort by a leader, drawing on various bases of power, to influence members of a group to direct their activities toward a common goal. Taking the property–process debate as a point of departure, let us turn first to the property perspective.

Order Out of Chaos

The trait theory (or great man theory) offered one of the earliest conceptual ways of looking at leadership. This theory holds that there is one best way to lead and that deeply seated personality variables allow certain people to master that best way. According to this theory, there are a number of universal characteristics of personality that determine a leader's effectiveness, without regard to behavior in a given situation. Because leadership is viewed as a set of relatively stable and enduring personal traits or physical properties, specific personality characteristics distinguish effective from ineffective leaders.

The initial search for these universal traits applicable to any setting was not overly successful, however. The results were conflicting, with methodological problems in research design cited as the major reason. Disappointed by the results of these studies, many scholars interested in leadership abandoned this line of research altogether, turning to other approaches to leadership. In the early 1990s, however, after a long hiatus in trait research (and with the help of better measuring techniques) a revival of trait theory was observed. Those studies went beyond the simplistic, atomistic approach of previous trait studies and identified a number of personality characteristics that consistently emerged, differentiating leaders from nonleaders – dimensions of character that can be mapped into the Big Five model of personality structure (Hogan et al., 1994). These various dimensions can be described in terms of surgency (a broad term that embraces competitiveness, achievement orientation, self-assuredness, and dominance), agreeableness, conscientiousness, emotional stability, and intelligence (including emotional intelligence). In addition, these studies regularly listed factors such as physical energy and extraversion.

Another group of leadership scholars espouses a behavioral theory. Distinguishing between the technical actions of a leader and the human actions, these behaviorists emphasize a set of observable role behaviors rather than traits. Like trait theorists with their individual characteristics, these scholars see certain role behaviors as being universal – that is, as producing leadership effectiveness regardless of the setting. Generally, however, the constructs employed by these scholars have been too rudimentary. This approach often looks at behaviors via dimensions such as consideration vs initiation, or task orientation vs relationship orientation (Bales, 1958). Another popular typology with a behavioral slant on leadership contrasts autocratic and democratic approaches (Tannenbaum and Schmidt, 1958).

From this approach to leadership behavior, we move on the continuum to contingency theory. Instead of taking the position that leadership traits or behaviors are applicable to any situation, those supporting the contingency theory claim that the emergence of any one style is contingent on the environment in which the leader is operating. According to this point of view, the most effective leader is the one who is able to adapt his or her actions depending on the situation. In the model of one of the most prominent advocates of this point of view, the effectiveness of task- or relationship-oriented leaders depends on the favorableness of the situation as defined by the power of their position, the task structure, and the quality of the leader–member relationship (Fiedler, 1967).

The Importance of Attribution to Leadership

Another group of scholars espouses the attribution theory of leadership. According to these situationists, leadership is not a viable scientific construct; it is a mere label given to behavior. Only people's inferences about and reactions to leaders are viable (Calder, 1977). Because individuals have an inherent need to explain events that surround them, they assume that certain types of behaviors and actions can be attributed to the leader. Thus leadership is a perceptional issue, an illusion: individuals infer causation from observed behavior. The knowledge of the outcome causes individuals to attribute certain qualities to a leader.

This more situational point of view has been reinforced by a number of scholars of leadership who doubt whether leaders affect organizational performance. Advocates of this line of thinking contend that there are powerful external forces that shape organizational activities. Each leader is embedded in a social system – a system in which other actors not only have expectations regarding appropriate behavior but also make efforts to modify the leader's behavior – that places serious constraints on leader behavior. Leadership turns into a set of myths encouraging social construction of meaning, creating an illusionary causality (Pfeffer and Salancik, 1978).

The symbolic role of leadership has been further explored by other leadership scholars (Meindl et al., 1985). In an extension of the attributional school of thought, these researchers call attention to the 'romanticized' conception of leadership. Ironically (given the attributional school's situational roots), these scholars suggest that leaders can play an important role through the manipulation of symbols in the management of meaning – activities that can be highly effective in influencing others. Using the vehicle of symbolism, many advocates of the situational point of view have been inching toward an interactionist approach to leadership

studies, positioning the leader/led relationship clearly at central stage.

Leadership as a Charismatic Process

Like the attributional school of thought, the contingency approach has also set the stage for a more relational slant on the study of leadership. Believing a leader cannot be studied meaningfully in isolation from his or her surroundings, this approach views leadership as an interactive process among the leader, the followers, and the situation. This orientation, transcending earlier, more naive approaches to leadership behavior, is an important step forward.

The problem with many relational theories in the past is that their point of convergence was too narrow. Dimensions such as initiation vs consideration, social orientation vs task orientation, and autocracy vs democracy are overly simplistic in describing leadership in its context. Furthermore, these earlier relational studies focused far too much on exclusive superior–subordinate relationships, ignoring (or slighting) the various constituencies of the leader: the industry environment, the national culture, and the culture that characterizes the organization.

This shortcoming has opened the door for a fresh look at charismatic leadership. Another impetus for this line of research has been the prevalence of a business climate of uncertainty and unpredictability – a breeding ground for the emergence of charismatic leadership. In our competitive, global world, where the transformation and revitalization of organizations holds a central position, the leader is increasingly seen as a crucial agent of change.

The new focus, then, is on the inspirational role of leaders. Researchers are turning to the study of leaders who by force of their personality have an extraordinary effect on their followers. The challenge for leaders of organizations becomes how to affect the mind-set of the organizational participants through value creation, through influencing the organization's culture, and through building commitment to the organization's mission, objectives, and strategies to obtain well-above-average organizational performance.

The first person to take up this new challenge was political scientist MacGregor Burns (Burns, 1978). In his writing, he makes a distinction between transactional and transformational leadership. While transactional leadership can best be viewed as a mundane contractual exchange based on self-interest (often described in the literature as the manager's role), transformational leadership seeks to satisfy the higher needs of followers – to engage in a process of mutual stimulation and elevation whereby followers will transcend their own self-interests for the good of the group (Bennis and Nanus, 1985; Conger and Kanungo, 1998).

A number of researchers have built on Burns' notion of transformational leadership, using observed behavior of leaders to break the concept down into various components, in an effort to broaden early charismatic conceptualizations. For example, Bass and Avolio (1993), who view charisma as a subset of transformational leadership, list four behavioral components in the context of transformational leadership: (1) charisma or idealized influence, (2) inspiration, (3) intellectual stimulation, and (4) individualized consideration. According to them, charisma alone is insufficient to put in place a successful transformation process. Shamir et al. (1993) contend that charismatic leadership affects followers' self-concepts and has motivational consequences due to (1) changing follower perceptions of the task that has to be accomplished, (2) offering an attractive vision of the future, (3) creating a group identity, and (4) heightening individual and collective feelings of self-efficacy.

These various offshoots of a focus on the inspirational role of leadership contribute to a rich description of what the leadership mystique is all about. Researchers who view leadership as a charismatic or transformational process give proper attention to the contextual and cultural dimensions that are part and parcel of leadership dynamics. They are sensitive to the impact of the environment on leaders and on their behavior. Furthermore, they reject narrow instrumentalism in favor of a perspective whereby the leader is seen as the transformational agent of change. Other scholars have made the point, however, that the transactional role of leadership should not be ignored. They suggest that the most effective leaders take on two roles: a charismatic role (consisting of envisioning, empowering, and energizing) and an architectural role (designing the organization, setting up structures, and formulating control and reward systems (Kets de Vries and Florent-Treacy, 1999)).

Some scholars of leadership argue, however, that in spite of the new, richer color given to leadership research, additional steps need to be taken to deepen our understanding of the leader's relational interchanges (Martin, 2007; Kets de Vries and Balazs, 2011). And the challenge is formidable. In spite of the various rational ways in which researchers attempt to deconstruct leadership and charisma, charismatic leadership is not rational in the traditional sense of the word. By its very nature, it is unstable, in that it exploits what can be interpreted as irrational processes. We need now to find ways to explore the forces that transcend rationality. Critics also argue that the study design of many researchers evaluating inspirational leaderships treats all leaders and all followers as amorphous, interchangeable groups of people; in other words, they fail to attend to differences in personality style. To rectify these shortcomings in leadership research, deeper insight into people's desires, wishes, and needs is needed, and that insight can be provided by a clinical focus.

The Clinical Paradigm

The clinical orientation to leadership research uses findings from psychoanalysis, cognitive theory, developmental psychology, and family systems theory to arrive at a richer understanding of personality and leadership. In the deconstruction of the dynamics of leadership, this orientation looks to the triangle of mental life consisting of emotion, cognition, and behavior. While in other approaches to leadership, the focus is generally on cognition and behavior, in the clinical approach emotions enter the equation. Research on how people alter has revealed that cognition alone does not create change; cognition needs to be complemented by emotion. The clinical paradigm also factors in unconscious processes. It presupposes that the personality of a top executive influences the strategy, corporate culture, and even structure of his or her

organization to such an extent that often organizations cannot perform successfully if no attention is given to a leader's intrapsychic world.

The clinical orientation toward the study of leadership has helped achieve greater understanding of the leader–follower interchange. Research into the dyadic relationships created by leaders (and acquiesced to by followers) suggests that failure in leadership can also be considered failure in 'followership': just as influence moves down from the leader to followers, so also does it move up. Understanding the impact of transferential processes such as 'mirroring' and 'idealizing' – processes characterized by confusion of time and place between the leader and the led – helps researchers clarify otherwise inexplicable phenomena.

The clinical paradigm, with its belief that every thought and action has a reason, sheds new light on irrational behavior in organizations. Processes such as projection, projective identification, splitting, collective regression, identification with the aggressor, *folie à deux*, the fear of success, scapegoating, narcissism, vindictiveness, and containment – along with other elements of the clinical paradigm – can help researchers better understand the leader–follower exchange. The clinical paradigm can provide insights into the dynamics of group behavior and the role of the leader; illuminate male–female differences in leadership through the analysis of fantasies around gender; and provide an understanding of the positive and negative effects leaders have on the corporate culture, structure, and decision-making processes (Kets de Vries, 2006; Kets de Vries and Balazs, 2011). By looking at a leader's inner theater, scholars can better appreciate the reasons why that leader derails and his or her company fails.

Recent Developments

Although, at first step, venturing into the domain of leadership research may seem like walking on quicksand, this brief overview demonstrates the considerable advances that have been made over the last decades. Due to promising new research directions, especially those working toward a convergence of situationist and personalist positions, the prevailing attitude of disillusionment with leadership studies is experiencing a turnaround. After years of homogeneity in leadership research, the past two decades have seen a significant expansion in terms of theoretical frameworks and approaches. Most researchers of leadership now perceive the importance of a relational, interactionist point of view that looks at actual leaders in their 'natural' setting. Moreover, it is no longer difficult – given the rapid changes of our era – to convince researchers and practitioners of the relevance of the transformational side of leadership.

Since leadership is so closely tied to its context, the following represent a number of developments in the field as shaped by trends in contemporary organizational landscape:

1. *Cross-cultural leadership*: As global mergers, acquisitions, and strategic alliances become increasingly common, more attention needs to be given to the cross-cultural dimensions of leadership. When organizations join together in a partnership or merge to form a new company, it's very difficult to bring the strengths and values of both organizations together and to keep them alive in the new entity. Moreover, we have to take into account that leader effectiveness is contextual, and that success in one culture may not be successful in another. This is the reason why so many M&As fail. Hence, global or cross-cultural leadership is now becoming an important quality of a leader. Osland et al. (2006) define global leadership as "a process of influencing the thoughts, attitudes, and behaviors of a global community to work together synergistically toward a common vision and common goals" (p. 204). Such leaders are able to adjust to and lead effectively in different environments and to be able to communicate and work with diverse groups of people and partners. They have to be flexible and open to numerous diverse experiences. They have to have the acumen to decipher differences and idiosyncrasies of another culture and to know how to build off its strengths. However, questions remain as to what extent does effective leadership behavior vary from culture to culture, to identify the required competencies for leaders who run global organizations, and to foresee what are the future competencies he or she will need as organizations become more flexible, collaborative, and boundaryless (Martin, 2007).
2. *Shared, collective leadership*: The ability to create high-performance teams, in which leadership and decision making is shared, is also essential in present-day organizations. Leaders are confronted with new configurations such as virtual team leadership, distributed shared team leadership, and leadership within multiteam systems. In many organizations, teams have replaced executives acting independently and many teams exist for the specific purpose of handling what used to be traditional executive functions. Moreover, leadership is increasingly structured as a constellation of different individuals possessing different, but complementary roles (Kets de Vries, 2008). As such, team leadership requires people who have a solid dose of emotional intelligence who can get the best out of people; who unite their constituents around a common cause, and connect with them as human beings; and who help their people perform beyond expectations. Such leaders need to be able to create collaborative, cooperative teams of people who work together to prioritize activities and apply the organization's resources to reaching desired goals (Martin, 2007). While leading in a team can be one of the most fulfilling experiences of ones professional life, conversely it can also be one of the most frustrating and demotivating. Nothing is worse than being part of a dysfunctional, conflict-ridden team. Managing the darker side of team dynamics is also an important role of a leader (Kets de Vries, 2006; Kets de Vries and Balazs, 2011; Rosenbach et al., 2012). Questions remain as to how to capitalize on the synergy from diverse teams, how to create a shared reality among different members, and what can be done to 'stretch' and get the best out of the people in the team, and how a culture of shared leadership can be created throughout the organization?
3. *Moral leadership*: With the prevalence of corporate scandals in the last decade, governance issues are also taking the spotlight, with themes such as responsibility,

accountability, and ethical and socially responsible leadership. Corporate governance refers to the set of systems, principles, and processes by which a company is governed. They provide the guidelines as to how the company can be directed or controlled such that it can fulfill its goals and objectives in a manner that adds to the value of the company and is also beneficial for all stakeholders in the long term. But governance is part of the bigger issue of moral leadership, and one which attaches itself to the integrity and credibility of the leader and how he or she serves as the symbols to express the values that hold the society or organization together (Gardner, 1965). These are the enlightened and responsible leaders who are able to lift "people out of the petty preoccupations, carry them above the conflicts that tear a society apart and unite them in the pursuit of objectives worthy of their best efforts" (Gardner, 1965: p. 295). However, critical questions remain as to how society or organizations are developing current and future leaders to essentially rise above the collective and to take on the bigger questions of what the society or organization they are leading stands for, where they are heading, where they want to go, and what are the major forces and trends determining their future and to have the conviction, confidence, and courage to assume that role.

Emerging Areas of Research

Although leadership research has come a long way, more work needs to be done. One key factor in the selection of topics that require further investigation should be relevance of a topic to leadership's various constituencies. But 'relevance' needs to be broadly construed: the subject of leadership should be seen as applicable not only to a few highly exceptional individuals at the top of the organization but to a much broader audience.

Because of the challenges growing out of the exponential rate of change in this age of transformation, a number of issues feature prominently on the research agenda of the future.

1. *Adaptive leadership*: Organizations are now facing challenges at a rate unprecedented to previous times, with companies having to operate on a global level, keeping up with shifting competition bases, increased accountability from stakeholders, and the need for innovation and reinvention in order to stay ahead of the game. Leaders have to learn new ways of operating and mobilize their people throughout the organization to change its mind-set and behaviors in order to thrive in new business environments (Heifetz and Laurie, 1997). Leaders have the challenge of breaking long-standing behavioral patterns of their own, provide leadership that involves others, and to help organizational members to change their own behavior, while also managing the stress and uncertainty of change. They have to be able to create an environment in order to allow people to collaborate and work more interdependently, to build important relationships across boundaries, to lead with a more flexible style, and to be open and adaptable to new ideas (Martin, 2007). However, how does one go about to create a cultural change within the organization, and given the increased reliance of organizations on creativity and innovation, what can leaders do to stimulate and sustain this process?
2. *Authentic leadership*: Authenticity has its roots in Greek philosophy "know thyself" (Plato) and has seen variations over time "to thine own self be true" (Shakespeare). To guide others effectively, leaders must know themselves, who they are, and why they do what they do and to live up to their values. Authenticity suggests that individuals need to have a complete view of themselves and this includes taking into account both their strengths and weaknesses. Those who fail to consider their irrational and dark sides are like captains who blindly plow their ships into a field of icebergs: the greatest danger is hidden below the surface. Avolio et al. (2004) define authentic leaders as those who are "deeply aware of how they think and behave and are perceived by others as being aware of their own and others' values/moral perspectives, knowledge, and strengths; aware of the context in which they operate; and who are confident, hopeful, optimistic, resilient, and of high moral character" (p. 4). In confronting, with honesty, ones inner theatre, an individual is then free to discover and express his or her true self. Moreover, authenticity reflects back onto others. Through increased self-awareness, self-regulation, and positive modeling, authentic leaders can foster the development of authenticity in followers and provide them with a sense of purpose and self-determination. In turn, followers' authenticity contributes to their well-being and the attainment of sustainable and veritable performance (George et al., 2007). However, the link between authentic leadership and sustained organizational performance needs to be clarified. A leader may be authentic in his or her actions, but this might not necessarily lead to better organizational performance, nor be transmitted to followers. What are the factors which facilitate this transmission? In what ways can authenticity have a positive effect on organizational performance and can these positive effects be transmitted to followers? Another interesting issue is the mitigating role of culture on the transmission of authentic behavior from leaders to followers all across the organization. Links can also be made to help executives, through group coaching sessions, to ask the basic questions of who they are, what they believe in, and why they do what they do and in doing so, discover their authentic side. Group coaching has proven to be highly effective in creating authentizotic organizations, places where people are authentic, feel at their best – and give their best (Kets de Vries, 2001).
3. *Group coaching for leadership development*: Leadership coaching, which most commonly takes the form of one-on-one interactions between an executive and a coach, has changed the way many progressive organizations view professional and personal growth and development. It is a specific form of intervention that can be carried out strategically with individuals, teams, or an entire organization. While one-on-one coaching certainly has its benefits, leadership group (or team) coaching – in essence, an experiential training ground for learning to function as a high-performing team – is a great antidote to organizational silo formation and thinking, and a very effective way to help leaders become

more adept at sensing the hidden psychodynamic undercurrents that influence team behavior. Its aim is to direct a group of people toward a specific, mutually determined goal and to accelerate organizational performance by providing focus and awareness; it fosters strategic agility. Leadership group coaching sessions provide a safe space for honest and open explorations and confrontations wherein teams challenge and reassess their assumptions about themselves and others and in doing so, understand why they behave the way they do and why the team as a whole behaves the way it does. They undergo a cohesive experience, bringing the team closer together, not only in terms of resolving conflict and achieving mutual understanding, but also increasing shared accountability and renewed commitment (Kets de Vries et al., 2007). When instilled as part of its leadership development culture, team-oriented coaching cultures are like networked webs in the organization, connecting people laterally in the same departments, across departments, between teams, and up and down the hierarchy. However, more attention has to be paid to differentiating the quality and effects of the many leadership coaching programs currently available to determine those that have viable effects on sustained organizational performance and to measure such effects once executives take it out of the group coaching sessions and into their organizational life.

Leaders fulfill many different roles in people's imagination. They are catalysts of change; they are symbols; they are objects of identification; and they are scapegoats when things go wrong. Leaders are also prone to hubris. As Napoleon (an expert on the topic of hubris as well as leadership) once said, "Glory is fleeting, but obscurity lasts forever." All leaders are susceptible to the darker sides of power. The most effective leaders, however, are the ones who know how to balance action with reflection by using self-insight as a restraining force when the sirens of power are beckoning.

Abstract

In this article, we try to expand the lenses classically used in social psychology of development, and in particular, in the post-Piagetian tradition, to recent contributions of social and cognitive dynamics in development and learning. Psychological development has to be redefined as involving socially framed, culturally mediated, and interpersonally negotiated processes, and the dynamic relation between the person, others, objects, and instruments that are reconfigured through teaching–learning activities. The units of analysis, besides the traditional focus on the individual and/or isolated cognitive event, also include nowadays peer interaction and partners' roles, dialogical processes, argumentation, and specific institutional features of human practices, as illustrated through experimental social psychology. According to this general framework, learning and thinking appear more clearly as the collaborative result of autonomous minds confronting viewpoints and cultural artifacts (tools, semiotic mediations, tasks, division of roles) and trying to manage differences, feedbacks, and conflicts to pursue their activities. Moving from one activity to another, and from one space to another (pretest, joint activity, posttest), children have to reorganize their understanding, their language, and the organization of their social interactions.

From Individual to Collective Levels: The Social and the Psychological in Intellectual Development

In discussions about learning in the twenty-first century, there is a need for a better understanding of processes at the individual as well as at the collective level. At the same time, theoretical frameworks for learning have undergone several paradigm shifts from 'cognitive revolution' to more recent, various sociocultural approaches that have an increasingly greater impact in research and in the wider discussion as well. The units of analysis, besides the traditional focus on the individual and/or isolated cognitive event, nowadays include peer interaction, dialogicality, argumentation, roles of partner, and various institutional features of human practices. Another major issue is the status of knowledge in information society that, according to Engeström and Middleton (1996: p. 2), can be analyzed either by agency-driven microsociology-without-history or by historically relevant macrosociology-without-agency. A third way might be sociocultural approaches where human agency is a starting point and micro- and macro-cultural dynamics are included as far as they become relevant for understanding the activities participants perform *in situ* and over time.

In fact, the fruitfulness of interplay between 'the social' and 'the cognitive' was recommended a long time ago by Lévy-Bruhl who, according to Luria (1976), was among the first scholars to point out the qualitative feature of primitive thought and to treat logical processes as products of historical development.

As Moscovici (1990) suggests, there are at least two ways of approaching the interplay between 'the social' and 'the cognitive' (i.e., between social and cognitive or developmental psychology) or, in other terms, how deeply social relations and social changes are accompanied by profound transformations of thought, with regard to the appropriation of cognitive instruments both in children and in adults.

The 'Bartlett way' recommends the comparison of representations and beliefs of groups situated at different levels of evolution. In particular, Bartlett (1928) reminds us that the best introduction to the understanding of the social dynamics of cognitive constructions is to compare the novices and the experts within their own field or culture and not to compare the primitive and the ordinary member of a modern social group. Thus, the main aim of cognitive social psychology must be to carefully describe the modern and the normal in their milieu and in relation to topics that are significant for their common life.

A complementary contribution to this way can be found in Cattaneo's work (1864) about the crucial role interpersonal and group conflicts play in producing mental phenomena and mental organization.

The 'Vygostkian way,' which is also that of Piaget, passes through the child as the equivalent of a simpler or primitive and younger culture, and follows the child's development. This way therefore postulates that the social nature of human cognition appears in the individual's interiorization of social experiences. Progressively, as this process develops by a sort of causal spiral between social experiences and new cognitive tools, we can grasp the operations through which the people's consciousness is articulated with that of their partners and with the culture of which they are a part of.

Following these two different traditions, it is recommended that research in development and learning become an anthropology of the modern world, while developmental and learning psychology can be seen as the two tools for documenting the ontogenesis of the modern child.

After being separated almost to the point of losing all contact with each other, learning and developmental psychology are beginning to return to a shared line of research, which was the very starting point of developmental psychology, as Baldwin (1913) maintained: According to him, the individual is not socialized by society, but society individualizes itself in different individuals; or in other terms, society expresses itself continuously through each single individual.

Shifting the Paradigms: From the Individual to the Societal

Studies on learning have been undergoing gradual paradigm shifts, from the overemphasis of the biopsychological functioning of the individual learner, where failure is seen as a sign of incompetence, to taking into account other social factors, either in a perspective inspired by Lewin's notion of *psychological field* or in a more macro-sociological approach. Notably, the latter has called attention to major social problems surrounding the discrepancies in learning performances in school pupils according to their social position (socioeconomic background, gender, ethnicity), educational methods and their hidden curriculum, the streaming structure of school institutions, etc., and differences between the same subjects' performances in and out of schools. At the psychosocial level, evidence has pointed to field effects on performances. Since Orne's pioneering work in 1962, many studies have shown that the assessment of the subjects' competencies is affected by social factors such as the linguistic, motivational, and attributional factors, as well as with identity characteristics of the subjects, teachers' expectations, individual and public dimensions of the situation, and the climate of cooperation or competition. The rather controversial results of these studies (see below) have called for a more integrative theoretical framework, articulating the various levels of analysis from the individual to the societal, in order to take into account the ways in which these factors interact, relying upon precise descriptions of the networks of sociocognitive processes within which subjects think, behave, and learn (e.g., in the laboratory, at home, at school, on the street) and observations of the impact these experiences have on individual and collective cognition.

This has led to a new shift from determinism to constructivism, and from product-oriented to process-oriented studies. Studies have focused on the interdependency between successful formal learning in schools and family socialization, and closer attention has been paid to the teacher's role in defining precise expectations and giving adequate feedback to the students, on the one hand, and to the communication modes and patterns elicited in the learning and testing situations on the other.

Learning as a Sociocognitive Activity: The Essential Role of Partners

It has been established that interaction, in order to be instructive, does not always have to be between a child (or novice) and an adult (or teacher/expert), but it can be just as effective if it takes place between equally novice peers, given a certain number of conditions and for certain tasks. But this called for detailed studies on the influence of social interaction on the appropriation of cognitive tools. Three generation waves of research could be documented since the early 1970s (Carugati and Gilly, 1993; Psaltis et al., 2009). Recovering the importance of conflict both in social and developmental psychology, the notion of *sociocognitive* conflict (Doise et al., 1975; Mugny et al., 1984) was introduced in order to stress the effect of the simultaneous confrontation of different individual perspectives or viewpoints during social interaction that necessitates and gives rise to their integration within a new cognitive organization. In the same vein, the notion of *social marking* (i.e., the representations of social rules pertinent to the cognitive rule for correctly solving the task – conservations of space and respect for the asymmetry of social positions between child and adult) allows showing the positive influence of societal dynamics on cognitive progress, even in the absence of direct interaction with a partner. The importance of social relations and norms as a symbolic order giving meaning to the everyday practices at school becomes apparent here, and is manipulated in order to study how symbolic order mastered by children might be effective in building cognitive tools.

The Contribution of Experimental Social Psychology of Cognitive Instruments

Developmental social psychologists have stressed the social nature of conflict. They propose that interindividual conflicts are essential for the stimulation of cognitive development. These conflicts are sociocognitive and positive for individual cognitive progress under the conditions that they involve confrontations with a partner proposing a different solution to the same problem. Some conditions are described in terms of both prerequisites and of constructive/obstacle outcomes to the confrontations.

Two levels of prerequisites are illustrated by Mugny et al. (1984). These concern cognitive competence (some basic cognitive organization is required) and social competence (some abilities to communicate and to interpret information).

Constructive confrontations are promoted by arranging tasks in such a way that different viewpoints are possible and can be confronted, even when an incorrect response is proposed by a partner (Mugny et al. (1984), *em*). Another useful strategy is to encourage controversy in procon issues while stressing the cooperative context (Johnson and Johnson, 2002).

Obstacles to constructive confrontations are involved when the dynamics of communication conflict do not prevent both partners from solving the problem through a relational compromise: Compliance with the more assertive partner, social comparison, competition/avoiding competition, threatening partner's competence, activating demonstration of performance instead of mastery.

Summing up, ample research has shown that the effect of sociocognitive conflict depends highly on the situation in which it takes place (Buchs et al., 2004).

Conflict could lead low-competent participants to an improvement in their reasoning strategies, unless a competence-threatening competition was introduced. Along the same line, it was shown that conflict between high-competent participants led to trying to defend and protect one's own self-competence and rejecting the other's viewpoint – with disruptive effects on reasoning – unless competition was hindered (Buchs and Butera, 2009). Other research demonstrated that students could learn from a disagreement with an expert (Carugati and Mugny, 1985; Quiamzade, 2007). However, if the latter makes them feel incompetent, this results in a superficial compliance without deep learning. Another line of research has demonstrated that in a context enhancing mastery goals (i.e., improving one's knowledge, to learn), conflict was beneficial for learning whereas in a context enhancing performance goals (i.e., demonstrating one's ability), it was not (Darnon et al., 2007).

What, in these situations, changes the effects of a conflict? According to some authors, these situations are characterized by the fact that they do or do not threaten self-competence (Buchs and Butera, 2009). For these authors, two types of conflicts can be distinguished: In a context in which self-competence is not threatened, the conflict can be *epistemic*, namely, it can be focused on the question of knowledge. This kind of conflict leads individuals into rethinking the issue, examining the validity of different propositions, and trying to understand the problem. This can result in high-level cognitive processes and improvement in learning. However, if self-competence is under threat, individuals focus their attention on the question of self-competence protection instead of learning, and the benefits of the conflict are lost. Authors qualified this type of conflict as a *relational* conflict, thus echoing previous research with children (Mugny et al., 1984).

In conclusion, the significance of social psychological contributions to learning and instruction and in a wider sense, to educational research appears fully grounded, even in the framework of social influence processes as a grid, to approach the complexity of educational dynamics. There is evidence that social influence *stricto sensu* is relevant for such dynamics. Students, but also teachers, are continuously faced with social interactions in which a given source tries to convince them to change their beliefs, attitudes, or behavior. The empirical works consistently show that the outcome of such encounters largely depends on a regulation that is sociocognitive or relational in nature, leading to learning and development in some cases, or to resistance in others.

It is also useful to define social influence processes *lato sensu*. This allows considering a larger variety of processes through which the social context modifies dynamics relevant to learning instruction and educational settings. For instance, the negative (but also positive) impact gender stereotypes may have on performance is exemplary to this respect, as are the multiple and reciprocal influences between teachers and pupils or students in the classroom. In all these cases, pupils, university students, and teachers regulate their motives, beliefs, attitudes, and reasoning as a function of relevant social knowledge or information that is made salient in the context.

What is also clear is that the most meaningful knowledge that steers such regulations in one direction or another is the one that is relevant to self-competence. This is partly due to the fact that the social hierarchy is at least partially legitimized by a hierarchy of competence. Those who are more competent have a basis from which they can argue that they should be on top of others. In turn, this may explain why negatively stereotyped gender/groups may feel an identity threat that undermines their performance or learning. Also, scholastic judgments are guided by social utility, and social utility is determined by the demonstration of both intellectual or academic success and conformity to social norms (e.g., internality). In all cases, identity stakes are aroused by the social salience of the competence level expressed by performance.

Social Interaction as Dynamic and Dialogical Processes

Recent advances in this area have drawn specific attention to the dialogical dimensions of thinking skills. Given that neither thinking nor context is a static reality, each affects the other via its authors' and participants' initiatives and interpretations. Joint actions and thought sharing (via language and semiotic mediations) are dynamic processes likely to be productive for knowledge creation and learning in the individual and in groups. Dynamic processes do origin on verbal interactions and collaboration. Tartas et al. (2010) contribute to summarize the studies aimed at clarifying an unresolved issue from the study of Grossen et al. (1993), i.e., the apparent failure of adult training to generate progress in the posttest of adult-trained children. (The design was the same as Grossen et al. (1993). One hundred children took part, 46 of whom formed the control condition (pre- and posttest sessions: phase I and IV). Two other experimental conditions were organized. Condition 1: The novices went through phase I (individual pretest), II (adult training), III (joint activity), and IV (individual posttest). During phase III, they were asked to perform a joint activity with a novice (not knowing that the partner was a novice). Phase IV was a posttest similar to phase I. Condition 2: Children were not trained by the adult. They only went to the phases I, III, and IV. In the joint activity, the dyads always comprised a novice and an expert: The expert could either be an expert diagnosed as such at the pretest (condition 2) or a child who has become an expert via adult training (condition 1). In phase II, a third of novices were trained by an adult in a way that put them in an active position with opportunities to externalize their spontaneous thinking. The adult adjusted to the child when bridging academic concepts in the conversations and suggesting more advanced strategies. The intention was to enable the child to appropriate a specific kind of talk about the task (Kohs cubes) via granting agency to the learner trying to adjust the support to the specificity of the problems encountered in doing the task). The overall results are interesting (Tartas et al., 2004). From a cognitive viewpoint, social interaction with a more advanced peer was as efficient as a condition/sequence consisting of child-centered adult training followed by interaction with a novice peer. From a social viewpoint, the authors observed that this horizontal relationship between peers offered the novices opportunities for progress.

The results show that there were no major differences across the experimental and control conditions, except for the adult-trained children: They changed level significantly more than other groups. Theoretically stated, it has been shown that there are two kinds of competencies possibly acquired by children even after the same adult training: surface or deep. Deep competencies are acquired when children do not simply internalize the semiotic means offered by the adult, but when they engage in a more profound appropriation of the same means through thinking at the higher level.

Children diversely interpret the social role allowed by the experimenter. Some children are doing things their own way, for instance, autonomous but not very social. They have a limited understanding of what the experimenter means by 'working together.' Some other children seem to have understood that they had to learn to role-play what the expert-adult had done during phase II and to behave as such in front of their peer. However, some children misunderstood the adult's intents and they played the role of unqualified observers, and not the role of qualified observer and helper that the adult had taken.

The relationship to the peer was also diversely understood by children. Some limited themselves to expressing their own viewpoint while others looked at their peer partner's production and commented on it. They participated in a real dialogue with the peer, they started gaining resources that allowed them an opportunity to try out during the peer activity what they had learned with the adult, eventually then master it and reuse it successfully at the individual posttest phase. The instructions given by the adult were the same, but the 'thinking spaces' children constructed were quite different, probably because in front of this 'Brunerian' adult who was scaffolding their activity (enrolling them in the task, alleviating difficulties, expliciting verbally the names of the elements and the actions undertaken, etc.) the children had understood that their duty was to make explicit their viewpoints and strategies.

To summarize, learning and thinking appear more clearly as a collaborative result of autonomous minds confronting viewpoints and cultural artifacts (tools, semiotic mediations, tasks, division of roles) and trying to manage differences, feedbacks, and conflicts to pursue their activities. Moving from one activity to another, from one space to another (pretest, joint activity, posttest), children have to reorganize their understanding, their language, and the organization of their social interactions.

A Specific Type of Social Interaction: Argumentation

Argumentation is of interest to researchers who are concerned with the social and cognitive processes that promote learning. However, learning, argumentation, and learning by arguing raise theoretical and methodological questions: How and when do learning processes develop in argumentation? Is it the case for all subjects? How does one design effective argumentative activities? How can the argumentative efforts of pupils be sustained? What are the psychological issues involved when arguing with others? How can what the learners produce be analyzed and evaluated? The argumentative activity requires specific intellectual and social skills, and it is often emotional and demanding. Introducing argumentative activities in educational settings is not yet common. It requires attention at different levels. The complex argumentation skills must be given opportunities to develop in the growing child. At the interpersonal level, argumentation means confronting other people's perspectives. People often avoid these kinds of situations, which they tend to perceive as a risk to the self and to the relationship. At the institutional level, argumentative activities are sometimes considered time consuming when curricula are already overloaded. These activities require special social skills from the teachers, as well as ad hoc teacher training and assessment practices. At the cultural level, argumentation means the acceptance that social harmony is not threatened by the expression of a plurality of opinions; that assertions have to be backed up; that authority is not sufficient; and that discussions are permitted even when relationships are asymmetrical. As a result of this complexity, it is not possible for teachers to just improvise argumentation-based learning activities in the classroom. Precise design and adaptive management are needed.

An interesting line of research is the development of argumentation theories in the contemporary epistemological scene. Rigotti and Greco Morasso (2009) consider, in particular, the pragma-dialectical approach for its focus on the theoretical kernel of the discipline and for systematically eliciting, from this, the connected methodological implications. The key notion of argument is specified by comparing it to the apparently near notion of demonstrative proof. Analogies and differences are brought to light, and the rather fuzzy but challenging and fundamental notion of reasonableness is identified as denoting the main value at stake in argumentative interactions. The authors propose a model of argumentative intervention in which argumentation is conceived as a particular type of communicative interaction. The model aims both at producing and at analyzing/evaluating argumentative interventions. The fundamental claim is that assuring the quality of argumentation implies contributing to a healthy social consensus and promoting cultural development at the individual and collective levels.

In the volume edited by Muller Mirza and Perret-Clermont (2009), argumentation is examined as a psychosocial practice embedded in institutional, historical, and cultural contexts. Argumentation occurs when the conversation flow is disrupted by a disagreement, a question, or an alternative hypothesis. It is not easy to develop this peculiar communication, as it entails complex issues at the personal and interpersonal levels. Even though they are, in reality, interwoven, several dimensions are distinguished. At the cognitive and individual level, the questions include the following: What are the cognitive prerequisites for engaging in an argumentative interaction? How does the development of argumentative skills take place in children? Beyond the individual level the authors take into consideration other dimensions that are important, such as the relational and dialogical aspects of argumentation, the status of the partners, and the characteristic of the audience. Developmental, social, and sociocultural approaches in psychology are thus convened in order to construct a better understanding of this complex practice.

Schwarz (2009) provides multiple perspectives on the intricate relationship between argumentation and learning. Different approaches to learning impinge on the way argumentation is conceived: as a powerful vehicle for reaching shared understanding, as a set of skills pertaining to critical reasoning, or as a tool for social positioning. Each perspective has harvested empirical studies that have stressed the importance of argumentation in learning. In spite of the pluralistic stance adopted, Schwarz attempts to draw connections between the findings obtained in the different subject areas and perspectives: In mathematics, studies are presented that show deep gaps between argumentation and proof; in science, experimental studies are reviewed to examine whether and how argumentation promotes conceptual change; in history, Schwarz considers the role of argumentation in challenging narratives and in claiming a position; and lastly, the article describes the new wave that characterizes civic education programs geared toward the instillation of argumentative practices in democratic citizenship.

Argumentation may be a useful tool at different levels of educational systems. According to the claim that education is a dialogic process in which both the talk between teachers and

learners and the talk among learners have important roles to play, Mercer (2009) describes some classroom-based research in the primary school which has enabled teachers to encourage the development of children's use of spoken language for thinking and arguing effectively together, providing empirical support for the relationship among thought, language, and social activity, as claimed by the Russian psychologist Lev Vygotskij.

At the level of university students, Andriessen (2009) presents one case of using interactive media for supporting collaborative argumentation. The discussion is descriptive, focusing on the scenario and the tools that are used and on examples of actual discussions by students. Some basic mechanisms of employing argumentation are illustrated by students using computer tools (chat, forums, graphical tools) for producing an argumentative essay.

By drawing upon existing theoretical and empirical resources to discuss the successes and difficulties encountered in trying to introduce or sustain argumentative activities in learning settings, this approach contributes to the promotion of a large program of research. Considering argumentation as a key activity at the heart of many developmental processes, in individuals and in society, the study of argumentation opens the way to a deeper reconsideration of teacher training, curricula, and also of the nature of human knowledge and its potential advancements.

Classroom Learning and Teacher's Role

One requirement of group tasks at primary school level is that they are controversial; that is, amenable to different perspectives. This has been confirmed in research by Cohen (1994) that compares controversial with noncontroversial tasks. However, granted the possibilities provided by controversy, further considerations are also relevant. First, research suggests that all group members must believe that both their own *and* their partners' contributions are important. According to Meyers (1997), individuals exert less effort in groups when they understand their work as not embedded in institutional, historical, and cultural contexts.

By contrast, when students perceive their contributions to be original and significant, they continue to participate even if their work remains anonymous. In addition, individuals sometimes reduce their efforts to match the level at which they believe other group members are contributing. Thus, children may withdraw their participation to avoid the possibility of being exploited by 'social loafers' within the group (Liden et al., 2004). Second, it is accepted that tasks should be inherently group based and not amenable to completion by individuals working independently What is needed is a task that requires resources (information, knowledge, heuristic problem-solving strategies, materials, skills) that no single individual possesses, so that no single individual is likely to solve the problem or accomplish the task objectives without at least some input from others (Cheong, 2010). Third, tasks should be challenging relative to children's current level of understanding (Ofsted, 2012). With routine tasks, children tend to engage in fairly low-level thinking and interactions (Cohen, 1994). Indeed, social loafing may increase (and motivation decrease) when tasks are too easy (Liden et al., 2004).

While the need for controversy, challenge, mutual value, and group basis can be taken for granted, there is disagreement over the significance of group rewards. Slavin has argued repeatedly (e.g., 1990) that achievement is enhanced when group members are rewarded as a group. He believes that group goals and collective outcomes provide incentives for children to help each other and to encourage each other to put forth maximum effort. However, Slavin's research has been discussed on several issues (Cohen, 1994; Bridges, 2008). It is accepted that reward can help some students, but it is not effective for all. Moreover, according to Cohen (1994) offering rewards on a competitive basis, although effective in increasing motivation of team members to work together, may have negative effects on intergroup relations, more specifically on the perceptions that team members have toward other teams, or in other terms, may induce a social comparison at the intergroup/interindividual levels and even a stereotype threat with their negative impact.

According to Howe and Mercer (2007), research into the nuances of task design is in its infancy at present, and as it develops it will undoubtedly help to clarify why classroom dialogue remains unproductive and how this can be addressed. However, few scholars believe that the answer lies purely with the specifics of task. Over 20 years ago, Wells (1986) drew attention to difficulties with the overall *climate* of British primary schools, arguing that the *normative environment* for talk in most classrooms is not compatible with children's active and extended engagement in using language to construct knowledge.

This characterization of the classroom environment for talk is also one that emerges from more recent work by Alexander (2006). According to Alexander, classroom discourse is overwhelmingly monologic in form, as teachers typically offer children opportunities for making only brief responses to their questions.

It is interesting that Wells was writing at a time when British primary education was still heavily influenced by Plowden philosophy (cf The Plowden Report, 1967), while Alexander was addressing a more curriculum- and assessment-led context. It appears that the forces that oppose exploratory talk transcend policy changes. However, the monologic climate of most classrooms does not fully explain why, when left to work together, children only rarely use talk of an 'exploratory' kind. As demonstrated many years ago (Edwards and Mercer, 1987), the norms or ground rules for generating particular functional ways of using language in primary school – spoken or written – are rarely made explicit. It is often simply assumed that children will pick these sorts of things up as they go along (taken for granted). But while picking up the ground rules and 'fitting in' in a superficial way with the norms of classroom life may be relatively easy, this may mask children's lack of understanding about what they are expected to do in educational activities and why they should do this. What is expected in terms of behavior may be accepted without really being understood. The distinction between structures for classroom management (e.g., lining up in pairs or sitting rather than kneeling on chairs) and structures that develop learning (e.g., listening to a partner or asking a question) may not be

apparent to children. Indeed, even when the aim of talk is made explicit – talk together to decide; discuss this in your groups – teachers rarely make explicit what kind of interactions they expect to take place or discuss with their pupils' ways of using talk to engage productively in joint activities. There may be no real understanding, on the part of at least some children, of how to talk together or for what purpose. Many children may not appreciate the significance and educational importance of their talk with one another. Moreover, in the monologic environments described by Alexander (2006), they may frequently assume that the implicit ground rules in play in the classroom are such that teachers want the right answers rather than discussion.

Research has shown that, under certain conditions, interaction with peers helps children's learning and development. The expression of different views, such as alternative explanations or possible solutions to problems among children working together, seems to be particularly useful in stimulating learning and development, and it does not seem necessarily to matter if those differences are always resolved (or resolved productively) through discussion. Children can also develop important communicative skills through interaction with their peers, which again they would not learn by only taking part in conversations with adults. But, paradoxically, observational studies have shown that collaborative talk in classrooms is often unproductive and inequitable. There is no reason to believe that even young primary school children are incapable of using exploratory talk (as they have been observed to do this in informal contexts), but they often seem not to use their skills during classroom activities.

Some studies have suggested that the design of tasks can promote the use of exploratory talk, and hence more productive interaction; but changing task design does not seem to be sufficient in itself. Others suggest that the quality of collaboration can be improved if attention is given to developing an atmosphere of trust and mutual respect. There is evidence from intervention studies that this does lead to improved interaction and to improved learning, but the complexities of children's social histories suggest that it may not be sufficient. Other intervention studies support the view that the quality of interaction is significantly improved if children are helped to become more aware of how they use language as a tool for thinking together and taught some specific strategies for carrying on productive discussions. That research has recorded gains not only in children's use of exploratory talk and improved collaboration, but also in their individual skills in reasoning and academic attainment. Overall, it seems that children's social histories affect how they engage in collaborative learning activities, and those histories will embody their social learning both in and out of school (Howe and Mercer, 2007).

Although collaborative interactions and discussions are potentially very valuable for children's learning and development, that potential may only be realized if children are given structured guidance by their teachers on how to make the most of the opportunities that those activities offer.

In fact, evidence has amassed over the past 20 years to indicate that group work among children can support knowledge and understanding in elementary school (science classes). Group work has been promoted in many countries as a key component of teaching. Its relevance to science education is, for instance, a recurring theme of the teachers' professional journals. Nevertheless, as Howe (2009) points out, group work will never be sufficient to deliver the curriculum of a specific school subject; expert guidance is also essential. On the other hand, expert intervention can often undermine the value that group work is known to possess. One response to this debated point is to conclude that group work is trouble and valuable as well.

An approach by Howe (2009) revolves around the dynamics of *consensus/agreement* as a way to achieve positive cognitive outcome during group interaction. Several decades after the introduction of the theory of sociocognitive conflict (Doise et al., 1975; Mugny et al., 1984) it is acknowledged in an indirect way the role of divergence of initial opinions, as a starting point for a simultaneous comparison of different individual perspectives or viewpoints during social interaction that might escalate to their integration within a new cognitive organization. The key issue in Howe's research is that it requires children to discuss and achieve (or not) consensus about relevant factors during the first stage of experiments (shadow size, rate of cooling), as a prelude to subjecting consensual vs 'ideas people have' positions to empirical test during the second phase with the expert guidance. Besides the richness of the results, it seems worth noting that achieving consensus creates receptivity to expert guidance. But a further questions are raised: It remains uncertain whether by virtue of addressing consensual positions, expert guidance is seen as serving children's needs rather than having authority over these needs, and even if this did happen, whether this was relevant for supporting children and children's outcomes, both/either at the group and/or individual level.

Summing up, when studies highlighting the challenge posed by expert guidance in group-based work with children about science subjects have been reviewed (Webb, 2009), they uncover multiple dimensions of the expert's role in fostering beneficial group dialogue, including preparing students for collaborative work, forming groups, structuring the group-work task, and influencing student interaction through teachers' discourse with small groups and with the class. Common threads through the research are the importance of students explaining their thinking, and teacher strategies and practices that may promote student elaboration of ideas. In conclusion, teachers have many roles to perform when using small-group work in the classroom, including preparing students for collaborative work, making decisions about the group-work task and the composition of groups, making decisions about the structure and requirements of group work, monitoring groups' functioning and intervening when necessary, and helping groups reflect on and evaluate their progress.

Abstract

Learning is described as a universal attribute of animals that is accompanied by diverse changes in the nervous system. On the brain level, memory is seen as being represented in distributed neural networks. On the behavioral level, memory is seen as divided along a time- and a content-based axis (short-term, working, long-term memory; procedural memory, priming, perceptual and semantic memory (knowledge system), and episodic-autobiographical memory). Neurological and psychiatric disease conditions can be used to determine brain regions that act as bottleneck structures in information processing.

Learning and memory are universal attributes of the animal kingdom and consequently express themselves in hugely differing neural systems from planarians to human beings. It is nevertheless possible to point to some common mechanisms by which information seems to be acquired, stored, retained, and retrieved by the nervous system. Among the mechanisms are changes in gene expression, synaptic plasticity, long-term potentiation or depression, synchronization of neuronal firing patterns, protein synthesis, and the formation and remodeling of neural nets. Within the mammalian nervous system, the time-dependent nature of memory and its splitting into time- and contents-related subsystems (short-term and working memory; long-term memory; priming, a higher probability of recognizing previously perceived information; procedural, mechanical, or motor-based skills; perceptual, the recognition of stimuli related to familiarity judgments; semantic (knowledge system), the representation of context-free facts; and episodic-autobiographical memory, the conjunction of subjective time, autonoetic consciousness, and the experiencing self; cf **Figure 1**) engage different neural networks and require processes of information distribution and convergence ('bottleneck structures') that modulate, filter, and associate information to varying degrees (Brand and Markowitsch, 2003). Consequently, various contributions from molecular to behavioral and cognitive neuroscience have increased our understanding of the neural bases of memory. Its representation in the brain, nevertheless, remains largely hypothetical and speculative.

Basic Learning- and Memory-Related Neural Changes

Much of our current understanding of basic memory-related neuronal changes and modifications stems from the pioneering research of Eric Kandel and his coworkers (reviewed in Kandel, 2009) who largely used an invertebrate, the marine mollusc *Aplysia*, for their studies. Initially, they investigated simple memory mechanisms such as sensitization and habituation and found that there are both short- and long-term forms hereof and that the physiological correlates of the short-term forms are facilitated neuronal responses (increases in the magnitude of the excitatory postsynaptic potentials formed between sensory and motor neurons), and that of the long-term forms (repeated stimulus applications) required new ribonucleic acid and protein synthesis, involving the growth of new synaptic connections between sensory and motor neurons. Later, they extended their work to gene expression and transcription factors that provided the genetic switch for memory consolidation and storage. A specific protein, named CREB, which stands for cAMP-responsive element binding protein, became a new standard label within this kind of research. cAMP means cyclic-adenosine monophosphate, a substance important for providing energy to cells. Other workers from both the invertebrate and vertebrate side demonstrated, for example, that adenylyl cyclase is an important enzyme for short-term memory (Zars et al., 2000) and long-term potentiation (LTP) as well as long-term depression (LTD). These are important mechanisms for memory consolidation (Tronson and Taylor, 2007). There is evidence that LTP and LTD lead to changes in the morphology of nerve cells, particularly to the so-called synaptic plasticity (Kullmann and Lamsa, 2007) and to changes in dendritic spine density (Segal, 2005).

The crucial questions are whether these findings can be directly transmitted to human beings and whether they hold for different kinds of memories (Markowitsch and Staniloiu, 2012a). Here is less safe ground from current research and the focus lies more strongly on metabolic changes that can be related to brain circuitries (e.g., Sharot et al., 2007).

Memory Representation within the Mammalian Nervous System

Amnesias (*see* Amnesia: General) in humans occur after a wide range of disease conditions (see Panel 2 in Markowitsch and Staniloiu, 2012a). This fact alone implies that information processing in the mammalian brain is not controlled by a single center but, instead, by distributed networks. Furthermore, memory is also dependent on a large number of sensory, perceptual, attentive, emotional, and motivational processes each with its own anatomical substrates. The investigation of brain-damaged individuals consequently is of only limited predictive value for the action of the normal brain, as it demonstrates only what the brain cannot do without a particular region (sometimes, a brain with a damaged region is compared with a chain in which a link is missing; this implies that with the lesioning approach the functions of the damaged area are, in a way, never attainable, as the respective region is missing). Therefore, the complementary approach of studying the intact brain with neuromonitoring (electroencephalography, evoked

Figure 1 The five long-term memory systems and their presumed brain bases. Reproduced from **Figure 1** of Markowitsch and Staniloiu, 2012a; with permission.

potentials, magnetoencephalography) and functional brain imaging methods (positron emission tomography and especially functional magnetic resonance imaging and its variants such as diffusion tensor imaging) provides the necessary completion for inferences on the action of the brain.

In spite of the present-day range of methodological approaches for studying learning and memory representations in the brain, the old dichotomy between localizationists and antilocalizationists remains and can be perceived as one of ideology. The localizationists have a more mosaiclike view of information representation, they speak of 'centers' and 'modules'; the antilocalizationists prefer a Gestalt-like view and emphasize interactions and networks. A bridge between the two can be built by assuming a mixture of hierarchical and parallel processes of information representation (Markowitsch, 1984).

Memory Systems and Their Functional and Anatomical Correlates

The study of mammalian and in particular of human memory has to acknowledge the existence of several memory systems and their different neural representations. Aside from short-term memory, there are at least five major long-term memory systems: (1) procedural memory, (2) priming, (3) perceptual memory, (4) the knowledge system (or semantic memory), and (5) episodic-autobiographical memory (see **Figure 1**). Procedural memory is usually skill based; examples are riding a car, skiing, or playing the trumpet – that is, nonconscious, automatic processing of information. Priming refers to the fact that nonconscious presentation of a stimulus may lead to a higher probability of reidentification of it or of a similar stimulus at a later point in time. Both these systems are usually regarded as processing information implicitly or anoetically. The perceptual and semantic memory/knowledge systems are considered to be noetic and as processed mainly explicitly. Perceptual memory refers to familiarity judgments that are or can occur on a presemantic level, while semantic memory (the knowledge system) refers to general facts (world knowledge) of the kind: 'Madrid is the capital of Spain' or '12^2 is 144.' While the knowledge system consists of context-free facts, the episodic-autobiographical memory system represents context- (time-, locus-) embedded information. These episodes allow a mental time travel. Usually, episodic-autobiographical memories require a synchronous action of emotion- and fact-processing regions/networks in the brain (Markowitsch and Staniloiu, 2012a,b). One of the important distinctions between semantic and episodic-autobiographical memory is therefore that the latter allows remembering the episode and

the former simply to know the fact ("remember-know distinction"; Denkova et al., 2006). Episodic-autobiographical memories are usually processed autonoetically, that is, by reflecting on oneself.

Short-Term and Working Memory

The concept of working memory derived from the earlier one of short-term (and long-term) memories. While, however, short-term memory is seen as the online holding of information for an initial time period after first confrontation with it, working memory refers to a multicomponent, active processing of information, which also includes the transmission of already long-term stored information in a temporary buffer prior to retrieval, and which is composed of a controlling central executive system and a number of subsidiary slave systems (Baddeley, 2002). Numerous reports employing different methods from single unit recording, analyzing the consequences of brain damage to functional brain imaging, have reported relations between the prefrontal cortex and working memory (e.g., McNab and Klingberg, 2008). Some reports found that damage to left parietal regions impairs the online processing of information (cf Panel 3 in Markowitsch and Staniloiu, 2012a). Consequently, a frontoparietal network is seen as engaged in the control of attention and in processes of online working with memory.

Procedural Memory and Priming

The two principal memory systems that function independent of conscious reflection are procedural memory and priming. There are two basic forms of priming, perceptual and conceptual – perceptual priming refers to the direct match between the presently and the previously perceived stimuli, while conceptual priming refers to the same category or class of the present and the previously perceived stimuli. The distinction between these two forms is important as conceptual priming apparently is more complexly represented in the brain, recruiting more or other neural structures than perceptual priming. Consequently, conceptual priming deteriorates in age-related brain diseases and possibly even in patients with limbic system-related amnesias, while perceptual priming does not (or much less so). Limbic system is a conglomerate of cortical regions, nuclei, and fiber tracts extending from the cerebral cortex to the midbrain. Their main functions are related to the processing of emotions and memory. Conceptual priming has been related to prefrontal and even partly to medial temporal regions, while perceptual priming has much stronger affinities to unimodal areas of the posterior neocortex.

The procedural memory system is closely related to motor regions of the brain – to the basal ganglia, to portions of the frontal lobe, particularly of the premotor and motor cortex, and to cerebellar structures (some authors question, however, a specific role of cerebellar structures in procedural memory). Therefore, diseases such as Parkinson disease are taken as models – at least during the initial disease process – for selective procedural memory deficits (e.g., Cohen and Pourcher, 2007).

While not much is known about the specific brain regions involved from information encoding to information retrieval, there is some evidence that principally the same structures are activated during all stages from encoding over storage to retrieval (Cohen and Pourcher, 2007, however, found that encoding may function in a group of patients with Parkinson disease, while consolidation of procedural memories is impaired).

Brain Regions Relevant to Perceptual Memory, the Knowledge System, and Episodic-Autobiographical Memory

Perceptual memory as a noetically ('consciously') processed system has been introduced more recently than the other four memory systems. It is considered to be processed by polymodal association cortices of the posterior half of the brain. Episodic-autobiographical memory and the knowledge system are sometimes combined and then named declarative memory (Manns and Eichenbaum, 2006). Both systems have in common that they – at least during the stages of memory encoding and consolidation – rely, among others, on structures of the limbic system (Markowitsch, 1999), the episodic-autobiographical memory system most likely in addition on prefrontal structures. For retrieval of information, there seems to be a distinct lateralization; it appears that primarily right-hemispheric regions are engaged in episodic-autobiographical and primarily left-hemispheric ones in semantic-memory/knowledge system retrieval (LaBar and Cabeza, 2006; Markowitsch and Staniloiu, 2012a).

The structures of the limbic system have long been discussed as important for transferring information from short- to long-term memory. More recently, components of this system have been combined under the headings 'medial temporal lobe'; 'medial diencephalic' and 'basal forebrain memory system' and have been named bottlenecks for information transmission from short- to long-term memory (Markowitsch and Staniloiu, 2012a). Bilateral damage to structures within these systems usually leads to anterograde amnesia; that is, to an inability to store new memories long term (on a conscious level) (Markowitsch and Staniloiu, 2012a).

For the first system, the hippocampal formation was (and still is) seen as its hub; for the second, medial thalamic nuclei and the hypothalamic mammillary bodies are core structures and Korsakoff syndrome is one of the most well-known diseases associated with it. The basal forebrain system comprises cholinergic nuclei (basal nucleus of Meynert, diagonal band of Broca, and septal nuclei) and surrounding portions of the orbitofrontal cortex. In addition to various degrees of amnesia, confabulatory tendencies are prominent among patients with damage in this region (Borsutzky et al., 2010). Behavioral distinctions between the three systems are given in Table 1 of Markowitsch and Staniloiu (2012a).

There is another division of the limbic system that receives support from a number of sources; namely, the distinction between two interacting circuits: (1) the medial (or Papez) circuit centered around the hippocampus and (2) the basolateral limbic circuit (amygdaloid circuit). While Papez (cited in Markowitsch, 1999) considered his proposed circuit (hippocampal formation → fornix → mammillary bodies → mammillothalamic tract → anterior

thalamus → thalamocortical peduncles → cingulate cortex → cingulum → hippocampal formation) as principally engaged in the analysis of emotions, subsequent work showed that it plays a critical role for the transfer of information into long-term memory. The basolateral circuit is more closely related to emotional processing, and is also relevant for encoding the emotional valence of experiences. It includes the amygdala, the mediodorsal nucleus of the thalamus and associated regions, largely situated in the basal forebrain and in its extensions to anterior insular and temporopolar cortical areas plus interconnecting fibers such as the ventral amygdalofugal pathway, the anterior thalamic peduncle, and the diagonal band (Figure 2).

Bilateral damage to structures within the medial circuit is usually followed by severe memory disturbances – a fact that led researchers to speculate that amnesia might arise from an interruption of interconnections within this circuit and that the structures of this circuit are necessary for consolidation and for the transfer from short- to long-term storage. Bilateral damage to structures within the basolateral limbic circuit, on the other hand, seems to degrade memory processes by disconnecting the emotional from the mnestic properties of a given set of stimuli. For example, bilateral damage to the amygdaloid region may induce the Klüver–Bucy syndrome characterized by hyperorality, hyperphagia, agnosia, amnesia, hypersexuality, tameness/placidity, and hypermetamorphosis (Markowitsch and Staniloiu, 2011, 2012b). Since information encoding is, especially for episodic-autobiographical information, dependent on emotional content, damage to the amygdala is likely to have detrimental effects on memory. This indeed was shown in patients with Urbach–Wiethe disease (Siebert et al., 2003); such patients manifest a selective bilateral damage (mineralization) of the amygdalae. Two such patients were presented stories containing emotionally charged items and asked to recall them. They were significantly impaired because they could not show the preferential encoding of emotionally laden vs neutral items (Cahill et al., 1995).

Generally, bilateral damage to structures (including fibers such as the fornix; Staniloiu and Markowitsch, 2012) leads to severe and lasting memory disturbances. In addition, there may be disturbances of conscious reflection and self-reflection and executive functions; also, anosognosia and mood disorders may be present (Markowitsch and Staniloiu, 2012a).

Encoding and Consolidation

While encoding refers to the more early stage of information acquisition, there are different views on the beginning and end of the consolidation phase. Sometimes, it is seen as directly succeeding the encoding phase; sometimes it is viewed as a process occurring after information has already been stored long term. As both encoding and consolidation of episodic-autobiographical and semantic memories engage structures of the limbic system, they can be perceived as closely related.

There are nevertheless single cases of patients with amnesias of various origins showing a wide range of unstable memory processing periods so that it has to be concluded that there are several states and stages of memory consolidation, which depend on complex anatomicobehavioral interdependencies (Squire, 2007; Tronson and Taylor, 2007). A comparison with repeated attempts of producing a complex painting may be apt. Still, medial temporal, basal forebrain, and diencephalic regions contribute substantially to both the stages of encoding and consolidating by triggering, accompanying, and assisting the steps from initial binding to the final assignment. Especially the hippocampus has been proposed to index (previously encoded) information and assign it to specific (neo-)cortical loci. Amygdaloid and septal

Figure 2 The medial (Papez) (top) and the basolateral limbic circuits (bottom). The Papez circuit is composed of the hippocampal formation, mammillary bodies, anterior thalamus, and (conventionally) the cingulate cortex. These regions are interconnected via the fornix, mammillothalamic tract, thalamocortical peduncles, and the cingulum. The components of the basolateral limbic circuit are the amygdala, the thalamic mediodorsal nucleus, and the subcallosal area (basal forebrain); here, interconnections are the ventral amygdalofugal pathway, the inferior thalamic peduncle, and the bandeletta diagonalis. It is assumed that both circuits are relevant especially for encoding of information associated with the episodic–autobiographical and knowledge memory systems and that the medial circuit is more strongly engaged in the cognitive and the basolateral one in the affective side of information processing.

regions may evaluate and filter for importance – that is, they screen the biological and social significance of perceived stimuli.

Aside from the more 'classic' limbic regions, functional brain imaging results have pointed to a strong role of prefrontal cortical areas in both encoding and retrieving of information (Brand et al., 2009; Dickerson et al., 2007; Kroll et al., 1997).

Storage of Information

The ways in which information is – frequently life-long – stored in the brain is one of the biggest riddles of the neurosciences. Most scientists agree that the nervous system contains or forms the medium for storage, the more concrete mechanisms vary between species – invertebrates with their more 'rudimentary' nervous system may indeed have adopted other representations than mammals. Genetic and biochemical processes may nevertheless be common denominators (Kandel, 2009). For mammalian nervous systems, information may very likely be distributed along widespread cerebral cortical networks with or without auxiliary engagement of subcortical limbic structures (Markowitsch and Staniloiu, 2012a). The expanded cortical association areas with their large number of neurons and neuronal connections are primary candidates for information representation. Especially for emotionally colored memories – such as biographical episodes – the cortical nets may engage and trigger affect-coding limbic regions for their rerepresentation or 'ecphory' (Markowitsch and Staniloiu, 2012a). (The term ecphory describes the process by which retrieval cues interact with stored information so that an image or a representation of the information in question appears.)

There are, however, a few scientists who are of the opinion that most of our memories are represented outside our nervous system (e.g., Romijn, 1997; Sheldrake, 1988). Romijn (1997) considers a submanifest order of being as the principal storage place of memories. He is of the opinion that the whole universal in its spatial–temporal configuration would be permanently present in the submanifest order of being. Of this, a small portion would continuously materialize and thereby become available for psychic processing.

Retrieval of Information

The conventional view is that retrieval activates similar (namely, mainly limbic) brain structures as does encoding. This view may, however, be false or at least only partly correct: as mentioned above, the prefrontal cortex is a primary region for information retrieval. Converging evidence from studying brain-damaged patients with neuropsychological and normal subjects with functional imaging methods points to the necessity of (inferolateral) frontal and anterolateral temporal cortical regions for triggering the networklike stored information for successful retrieval (Fink et al., 1996) (**Figure 3**). There is evidence that emotionally laden episodic-autobiographical events are preferentially retrieved via frontotemporal structures of the right hemisphere, while general facts are preferentially retrieved by corresponding structures from the left hemisphere (LaBar and Cabeza, 2006; Markowitsch and Staniloiu, 2012a). It should be noted that the frontotemporal regions are bidirectionally connected via the uncinate fascicle, which seems to grow even in adulthood (Lebel et al., 2008) and seems to be affected in psychopathy and in maltreated children leading to an overgeneral memory effect in them (Staniloiu and Markowitsch, 2012).

While a few authors even assume the temporal cortex to be the actual storehouse of information, here the view is favored

Figure 3 The regions of the temporal pole and the inferior lateral prefrontal cortex, which are interconnected via the uncinate fascicle. This regional constellation of the right hemisphere is assumed to control the retrieval of episodic-autobiographical memories, and the left-sided one that of the knowledge system.

that its anterior portion provides the most direct access to the cortical storage network in the posterior half of the brain, while the prefrontal cortex is responsible for providing the effort necessary for a successful overall neural activation. Limbic structures of the medial diencephalon and the medial temporal lobe may have supporting roles in context-rich information retrieval (Markowitsch and Staniloiu, 2012a).

Retrograde amnesia – the failure of ecphory – may occur as a consequence of a progressively decaying cortical network – as is the case in patients with cortical dementia (e.g., Alzheimer disease) or, sometimes, after a condition of severe hypoxia (e.g., after a heart attack and coma state). In this group of patients, the information is usually lost permanently. When the damage is restricted to the hippocampus and related structures in the medial temporal lobes, the retrograde amnesia may be temporally limited (covering a period of weeks in rodents, up to years or even decades in humans, leaving remote memories intact), suggesting to several authors that the hippocampus may play a role in the initial formation of new memories, and may somehow contribute to the gradual integration of new memories into neocortical memory circuits (Squire and Bayley, 2007); other authors assume a general role of hippocampal structures in episodic-autobiographical retrieval (Rekkas and Constable, 2005).

Alternatively, retrograde amnesia may be the consequence of a disrupted access to the net. Here, the expression 'mnestic block syndrome' has been coined to describe this phenomenon (Markowitsch, 2002), which can be found both after manifest brain damage in the frontotemporal cortex and after so-called functional amnesia, which is seen in patients with dissociative forms of amnesia. Such functional amnesias especially appear as a consequence of stress and trauma experiences. In this second category of patients, the mnestic block is usually selective, affecting primarily emotion-laden personal episodes, and it is assumed that the information – the engram – is in principle still in the cortical nets.

The Learning and Memory Networks – Conclusions

Learning and memory engage a wide range of brain regions – nevertheless, a conclusion that it is the total mass of the nervous system that codes information for storage would be a false one. Instead, the principles of convergence and divergence of information transmission hold throughout the nervous system and there are both modality- and material-specific channels for information encoding, storage, and even retrieval and there are bits of information that are rich in affect and consciously reflected (and consequently require wide neural nets in which individual structures act in synchrony), while others are processed only subliminally and may never gain conscious representation (Markowitsch and Staniloiu, 2012a). Furthermore, information is not represented in a static manner within the brain – mood, the environment, focused attention, internal associated cues, hormones, and many additional factors influence, modify, and rearrange our knowledge. The phenomena of state-dependent learning and retrieval and of false memories are examples for the susceptibility and vulnerability of our memories (Kühnel et al., 2008). The concept of plasticity has gained considerable support from invertebrate to human research and also the concept of lifelong learning, proposed by the social sciences, demonstrates that information representation is much less hardwired and rigid than formulated by traditional frameworks (Kim and Linden, 2007; Leal-Galicia et al., 2008).

Abstract

This article focuses on learning disability and social work. It outlines key debates in the field including philosophical debates, policy, and practice. Social work practice in this field has experienced significant change as models of service delivery have been transformed over time including a major change, the move from institutional to community care. Alongside of these structural changes and developments in service delivery were changes in the philosophical approaches that informed practice, for example, the emergence of key ideas such as normalization and the social model of disability, that presented challenges to thinking about disability and service delivery including social work. Central to social work practice in this field is work with families and some of the key aspects of this work are discussed in this article.

Introduction

This article focuses on learning disability and social work. It explores some of the philosophical and theoretical perspectives that have informed practice and highlights the history of these frameworks and the changes to perspectives over time. A significant development in the field of learning disability was the change from custodial care in large institutions to community care and this major change in service delivery resulted in new approaches to supporting people with learning disabilities and their families. These approaches to support and the factors informing social work practice, including the issues that may arise in practice, will also be discussed. The article concludes with a discussion of collaborative practice which provides a framework for practice that enables social workers to work alongside people with learning disabilities to promote inclusion in community life.

Definitions

The term mental handicap has been replaced by terms such as learning disability. In some countries the word intellectual disability is used as is the phrase: people with intellectual disabilities (for further discussion on the genesis of the term learning disability see the website: http://www.learningdisabilities.org.uk). In this article the term learning disability will be used. The UK Department of Health (2001) in their policy and practice documents uses the following definition:

Learning disability is described as a:

- significantly reduced ability to understand new or complex information and to learn new skills,
- reduced ability to cope independently which starts before adulthood with lasting effects on development.

In this article the phrase disabled people will also be used as this is also an accepted terminology and consistently used by disabled people themselves.

Philosophical and Theoretical Perspectives

A number of philosophical frameworks have informed the provision of support and services to people with learning disabilities. A key influence on the lives of people with learning disabilities has been the adoption of the principles of normalization which has informed service provision since the 1970s (Munford, 2012). The decade of the 1970s was a watershed year for developments in support and service provision; the key proponents of normalization, Nirje and Wolfensberger, argued for an approach that challenged the practices of institutionalization and supported people to lead culturally valued lives within their communities. In many countries around the world such perspectives were the catalyst for changes in policy and practice that led to the closure of large institutions and encouraged the move from custodial care to care in the community. Here the challenge was to support people with learning disabilities to engage in culturally normative experiences (Sullivan and Munford, 1998, 2005). Promoting this movement from institutional to community care was the advocacy by parents to have their family members living with them or in community settings; this resulted in a focus in the last few decades on developing community services that are designed to include people with learning disabilities in 'everyday' activities and to support them to fully participate in community life.

While normalization principles have been the predominant perspective informing service provision for people with learning disabilities theoretical and philosophical frameworks such as the social model of disability have also had a key role in defining the experience of disability (Oliver, 1990). Central to these ideas is understanding disability as a set of experiences rather than as a pathological condition requiring medical intervention. Impairment is viewed as a natural part of the diversity that constitutes the human condition (Munford and Bennie, 2009). The social model emerged as a dominant perspective in the 1960s as a response to the medical model (Sullivan and Munford, 1998, 2005) which had its origins in the rise of medical science, economic rationalism, and social Darwinism (Munford and Bennie, 2009: p. 210). The emphasis

 http://dx.doi.org/10.1016/B978-0-08-097086-8.28118-X

here is on disability as an individual problem; disabled people are viewed as the victims of personal circumstance and tragedy and the response to this focuses on diagnosis, prevention, and personal adjustment. As Munford and Bennie (2009: p. 210) argue, the "medical model had a pervasive influence"; this has been well-illustrated by the large-scale institutionalization of disabled people that occurred throughout the nineteenth and twentieth centuries. Criticisms of the medical model gave rise to new perspectives and thinking about the experience of disability. The social model had a profound influence and changed the approach to service provision (Sullivan and Munford, 1998, 2005). The social model regards social reality as a product of social interactions and disability is seen to be constructed through the interactions between disabled and nondisabled people. The construction of disability is one of deviance and deficit where disabled people have stigmatized identities (Hallahan, 2010; Munford and Bennie, 2009; O'Brien and Sullivan, 2005). The social model provides an analysis of the situations of disabled people and challenges the way in which their lives have been constructed by others. Central to this is reframing the interpretation of impairment and supporting disabled people to create meaningful lives.

Under the rubric of a social model of disability the term 'disability' describes the negative experiences that people with impairments encounter in a 'disabling society' for example, marginalization, lack of opportunity, and overt discrimination (Munford and Bennie, 2009). Such an approach requires a reconceptualization of the issues facing people with disabilities as issues of citizenship and participation in the 'everyday' experiences of community life. The ideas that have constituted a social model of disability have been extended into a political model of disability in order to more adequately describe the role of social structures in defining the experience of disability. Under this approach the relationship between impairment, the construction of disability, and the social conditions (such as unemployment, poor housing and unemployment) is explored (Munford and Bennie, 2009; Stainton et al., 2010). The political model has its origins in the critical tradition and in post-modernist thinking (Munford and Sanders, 2008) and promotes a view of the world as one of irreconcilable differences. These differences arise out of power relations and conflicts between those who control resources and administer power and those who are subject to these practices.

A political model of disability seeks to understand the nature of differences and conflicts and asserts that these can only be resolved through fundamental changes to the structure, organization, and dominant values of society (Munford and Bennie, 2009: p. 211). As with the social model, a political model defines disability as something people experience rather than something people have; rather than being viewed as the consequence of impairment itself, disability is regarded as a consequence of living with impairment in a disabling society. This society is organized in such a way that it fails to take account of impairment (Oliver, 1990). Within this perspective the problem is located not within the individual, or even between individuals, but in a social milieu where structures and dominant values make disabled people the collective victims of an unknowing and individualistic society (Munford and Bennie, 2009: p. 211). Disability is therefore to be understood as a political problem, not just a medical or social problem and within this perspective disabled people have a place within which to assert their human and political rights (Sullivan and Munford, 1998, 2005).

While the political model has advanced thinking around the experiences of disability and provided a way forward in terms of political action, writers in the field also remind us not to forget about what happens to individual 'bodies' and to think more deeply about the nature of impairment and its impact on lived experience (Reeve, 2002; Stevens, 2008; Williams, 1999). Reeve (2002) argues for a perspective that incorporates a psycho-emotional dimension of disability that acknowledges disability as a social problem but that also explores "the role played by impairment and illness in the life experience of disabled people" (p. 494). Here embodiment and the lived experience of the body are central and in using Foucauldian concepts such as the 'technologies of power.' Reeve (2002: p. 495) argues that psycho-emotional dimensions of disability broaden the analysis to include what disabled people can 'be' as well as 'do.' One key 'technology of power' is that of the 'gaze' where disabled people are observed and assessed and constantly come under the scrutiny of others. For people living with learning disabilities being subject to the 'gaze' of others who determine what they can and cannot do becomes part of their daily lived experience; for example, this is often the experience of parents with learning disabilities (Booth and Booth, 2003; Llewellyn and McConnell, 2002). Reeve (2002: p. 504) suggests that "acknowledging the personal experiences of living with impairment and disability is politically unifying rather than divisive because it enables recognition of the range of disability experiences, and how these are mediated by impairment and other interesting identities such as gender and age."

Williams (1999) also argues for a broadening of the social model of disability by rewriting the body back into disability politics; such an approach counteracts the tendency to portray a "homogeneity of interest" (p. 810) that masks the diversity of the experiences of disabled people. He argues that to understand the diverse and different experiences of disabled people we have to understand the experiences of "real impaired bodies" (p. 811). This understanding provides insights into the struggles for personal coherency within adversity and builds a political understanding that contains the seeds of resistance and emancipation (p. 811). This view of disability is as an 'emergent' property which results from an interplay between physiology, structure, and sociocultural systems that represent a 'dynamic' relationship between individuals and societal contexts. It is in this way that 'a critical view of agency' is retained including the "transformatory potential of embodied social praxis" (p. 813). These perspectives have much to offer the political and social change projects for people with learning disabilities; such approaches provide a theoretical and practice framework that incorporates understanding about the daily struggles emerging from impairment alongside an understanding of the context of social life that either restricts or expands opportunities. As Hallahan (2010: p. 127) suggests, a full account of 'real' lived experiences requires a nuanced approach that works with multiple meanings and experience of disability including inter alia: embodiment and what impairment means in the daily lives of disabled people; the

oppression experienced within service systems that have functioned to exclude people from participation; issues that arise from the response of others to the impairment; and underlying all of these experiences, "the desire to be honoured, respected, and supported alongside [other] … citizens."

All of the various perspectives have, over time, influenced policy frameworks and service provision and it is to a discussion of these that we now turn.

Policy Frameworks and Service Provision

In many countries around the globe the interests of disabled people are now firmly placed on policy agendas and much thought is given to how services should be delivered (Munford, 2012). People with learning disabilities had been silenced, often living in segregated communities including large institutions that often discouraged regular contact with their families and kept them hidden from society. Over the last few decades there has been a major change in the lives of disabled people who are now visible in our communities; legislative change and policy reforms have crystallized the issues associated with the move from segregated settings to community care. Disabled people and their support networks have challenged the policies and services that have functioned to exclude rather than involve them in the daily lived experiences of their communities in spheres such as education, work, parenting, and recreation (Munford and Bennie, 2009: p. 213).

Strong and sustained advocacy by disabled people and their support networks has facilitated access to resources and services in the community. However, service provision for people with learning disabilities is of variable quality and in many countries appropriate, and high quality services (that advance human rights and participation in community life) are simply not available. While there may be a commitment to supporting people with learning disabilities to have access to appropriate services, issues over entitlement can limit access and exclude some individuals (Sullivan and Munford, 2005). The assessment procedures used to determine access to services may be focused on tightly circumscribed needs rather than on individual rights given that a service system must deliver what is economically feasible. In such conditions restrictions on resources often mean that entitlements based on rights are denied and needs are not met (Munford and Bennie, 2009). However, despite these restrictions alternative options for living and working have opened up new possibilities for people with learning disabilities. New technologies such as computer-assisted communication have enhanced participation in education and provided for better access to information that has also been a catalyst for people to be better informed of their rights and entitlements.

People with disabilities continue to demand "their rights as full and equal citizens" (Stainton et al., 2010: p. 1) and these rights are enshrined in international legislation such as the UN Convention on the Rights of Persons with Disabilities. Such recognition in law secures rights and "demands for control over how, when, and by whom" (p. 1) support is provided. For people with learning disabilities progress can be assessed across the key domains of living environments, personal lifestyles, education, and employment. While advances have been made in each of these areas many challenges remain. For example, with regard to living environments, while there is now an expectation that disabled people will live in services that are located within neighborhoods that enable them access to the ordinary daily activities that are available to other citizens, some of these services are still segregated and do not facilitate full participation in community life. In many countries in the education field, there is now an expectation that people with learning disabilities do not need to be educated in special schools but can participate in mainstream educational opportunities, that is, in schools in their communities. This aspirational goal of an inclusive education guides practice in education in many countries around the globe. However, the reality can be different because given the competition for scarce educational resources the experience of people with learning disabilities in mainstream settings can be one of alienation and marginalization. This means that they are excluded from the ordinary daily activities that other pupils take for granted. In these settings social workers often work alongside families and people with learning disabilities to become strong advocates for full participation. These experiences in the school system also play out in the employment arena, where again, the aspirational goal of full engagement in employment in all settings cannot be realized because of either scarce resources, or, because of a lack of commitment to provide the support that is required for disabled people to enter and sustain involvement in the labor market. Key challenges also arise in the transition from school to work where people with learning disabilities may have been well supported in school environments but this support has not been transferred into work settings. With regard to choices about personal lifestyles, these too, may be restricted as in many countries there is still not entitlement to the full spectrum of experience that constitutes human life, such as sexuality and caring for others including becoming parents (Booth and Booth, 2003; Llewellyn and McConnell, 2002; Munford et al., 2008a,b; Ward, 2011). As Hallahan (2010: p. 127) suggests, disability is an evolving and complex situation where policy and social practices will determine the opportunities open to people. Social workers can have a key role in opening opportunities taking on key support roles that position them as 'allies in emancipation' (O'Brien and Sullivan, 2005).

The Social Work Role – Key Elements and Challenges

Social workers are in a unique position to support people with learning disabilities to fully participate in community life. Working across systems and at the individual, community, and policy level social workers are well-placed to build a deep understanding of the issues confronting disabled people in their daily lives. Moreover, social workers can also resist roles that require them to act as gatekeepers to resource and services, but position them as agents of change in disabled people's interests (Hallahan, 2010). Central to this role is developing an analysis of how services function and whether they promote meaningful opportunities and possibilities for valued identities. A critical analysis enables social workers to work on the cutting-edge and to challenge restrictive service

practices; for example, putting the spotlight on community-based residential services that have become entrenched in models that restrict choices and isolate people with learning disabilities in community enclaves. Similarly, as Munford and Bennie (2009: p. 215), argue, there may be a need to challenge the policies that result in the isolation of work and day activities in segregated environments such as sheltered workshops. Here, there is often little connection between services and the communities in which they are located and as a consequence "people's lives may become compartmentalised, bureaucratised and isolated" (p. 215). Moreover, under such restrictive practices, the daily lived experience of people with learning disabilities become constructed in terms of service systems rather than experience being framed by people "merely wanting to be ordinary citizens participating in ordinary activities and having ordinary lives" (p. 215).

Given the challenges outlined above, a key task for social workers is that of advocacy. As members of teams social workers often work alongside the people with learning disabilities to support them to access community resources and to be supported in mainstream environments, such as schools and work places. Social workers may also be required to work at the macro-level to highlight the effects of policy and service decisions and to identify gaps in services. This work is informed by their understanding of the perspectives on disability outlined above. From a psychosocial perspective this requires working with individuals to understand the support required to enable people with learning disabilities to fully participate including becoming partners and parents and living and working in community settings. Working within a political model, social workers would extend this understanding of lived experience at the individual level and critically examine why people may be marginalized in their communities and excluded from participation. For example, in the employment domain social workers may help the person access resources that would help them find a job and then facilitate practical support in 'real' work contexts. The social worker may also work at the political level challenging the systems that prevent direct entry into the labor market and may invoke human rights legislation such as the UN Convention on the Rights of Persons with Disabilities to challenge discrimination (Munford and Bennie, 2009: p. 216).

Alongside direct support work with people with learning disabilities social workers will also work with families including parents with learning disabilities. Social workers support families to access services and resources and also provide a valued role in assisting families to make sense of the discrimination they often experience. This may involve the social worker standing alongside the family as they challenge service systems and community networks that prevent rather than encourage participation. For example, the social worker may use the inclusive education policies in a particular education jurisdiction that underline the rights of people with learning disabilities to be included in mainstream schools, to support the family to actually make this happen. The social worker may have an on-going role with the school in that they will not only support the family to achieve the right to enroll their child in the local school, but they may also be available to work through any emerging issues that may restrict involvement of the person in all school activities – academic, social, recreational, and extracurricular activities.

The example cited above, demonstrates the importance of social workers building a deep understanding of policy, legislation, and services, while they work alongside families and people with learning disabilities to realize their dreams of full participation in community life. Historically the medical model of disability would have promoted a view of the child with a learning disability as suffering deficits and the best response to this would be to institutionalize this child (Munford and Bennie, 2009: p. 216). We have seen from the discussion above, that emerging theoretical and practice perspectives have changed the way in which disability is constructed. These perspectives align with other approaches that promote inclusive practices and involvement of disabled people in community life. A key perspective informing social work with families who support people with learning disabilities is strengths-based approaches. Such approaches encourage social workers to move from defining the issues families face as 'deficits' to defining these as challenges that can be addressed with the right supports, networks, and services. This approach aligns with those in the disability field that call for a reframing of the issues facing disabled people as issues of citizenship, participation, opportunity, and support (Munford, 2012).

Strengths perspectives encourage social workers to think differently about family life and to understand that a focus on 'deficits' and on 'problems' can mask the 'multiple positions' families may occupy (Munford and Sanders, 2008). This approach does not downplay the challenges and daily struggles that families and people with learning disabilities confront, but directs attention to understanding the diversity of family life and to determining how families can be more effectively supported. Underpinning strengths approaches is the belief that people with learning disabilities have a right to an ordinary life and that it is unhelpful to perceive those who face enduring challenges as suffering human beings living tragic and sad lives that need to be 'fixed' before they can fully participate in their communities. The principles inherent in strengths approaches encourage social workers to work differently in their 'professional' roles, holding the notion of 'expert' lightly so that the knowledge and strengths of families and disabled people direct the support relationship (Munford, 2012). This approach is in contrast to the role social workers had when services were informed by the medical model. In this period social workers were more likely to take on roles that required them to independently make decisions about service delivery and access to resources without necessarily consulting with those would be affected by these decisions. In contrast to this approach social workers, under the rubric of approaches such as strength-based practice, are encouraged to work collaboratively with families and disabled people. This includes finding ways to affirm the support relationship and its important role in enabling people with learning disabilities to live in their local communities (Munford, 2012).

Central to these new approaches of service delivery and social work practice with people with learning disabilities and their families is to ensure that the disabled person remains at the center of support relationships and directs decision making. In other words, decisions are not made on their behalf and without their knowledge. They direct what decisions need

to be made and also the decision-making processes; here the social worker has a key role in ensuring that all of the information required to make these decisions is available in an accessible form and that options are realistic and meaningful. The goal in such practice is to support people to find positive and valued identities and this requires a commitment on behalf of the social worker to understand the barriers to social inclusion and then to work with the person to overcome these (Munford, 2012).

A significant component of social work support is enabling family members to fully participate in decision-making processes and to accept the disabled person's right to direct these processes. This can be difficult for families who have had to take on strong advocacy roles for their family members and who have trusted service providers who have failed to deliver on their promises of providing responsive and empowering services. This is often the experience for mothers who have often taken on the major care roles for their child/adult and have often been challenged by professionals that they have become too involved and overprotective. Taking a back seat can be difficult for these families who have faced many challenges and this requires social workers to be skilled in relationship management so that all voices in the support relationship are heard and respected (Munford and Sanders, 2008). For disabled people who are parents themselves the challenges can be intensified as their parenting is often scrutinized and judged by others (Booth and Booth, 2003; Llewellyn and McConnell, 2002; Munford et al., 2008a). To this effect disabled people remind us that effective support relationships are based on interdependence and reciprocity (Munford et al., 2008b; Ward, 2011). This is a direct challenge to the ways in which disabled people have been defined as passive recipients of care where they have had things done to them rather than with them. As Ward (2011: p. 178) argues, "care [support] is a democratising process" and that "the binaries that position people as dependent or independent, carer and cared for" need to be disrupted. What is required is an understanding of care [support] relationships as mutual and reciprocal and this orientation to support opens up new spaces for participation and for promoting disabled people as active citizens (p. 178).

The call from disabled people to be part of support relationships that are based on mutuality and reciprocity has led to some considered and deep thinking about what factors are central in building successful support relationships. The research suggests that to be effective support relationships should be responsive and flexible and that the ultimate goal is to build an interdependent network of support within communities. At the core of this network of support are collaborative partnerships between people with learning disabilities, their family members, and social workers and other support people. Collaborative practice grows from the recognition that when people have power and control over their circumstances they are more likely to find positive solutions to their issues and challenges (Munford, 2012). A collaborative orientation to support emphasizes joint agenda setting and identification of shared goals that take account of the needs and rights of all those involved. Key to this approach is recognizing and respecting what people bring to the relationship; alliances are formed in order to access services and these alliances are respectful of differing meaning systems. Moreover in keeping with the principles of strengths approaches social workers adopting these practices work to understand family life and the daily lived experiences of disabled people in order to understand what has worked in the past and to then use this knowledge to find solutions to current issues. Taking a collaborative approach means that there is considered thinking on issues and attentiveness to opportunity and possibility; within this approach alternative strategies are generated so that there is different thinking about services so that the most can be made of available resources.

Key principles informing collaborative social work practice are:

- The person is at the center of the support partnership and determines the relationship with social workers, other professionals, and service systems. Time is taken by social workers to understand the daily lived experiences of the disabled person including their support networks. An example of this in practice involves social workers harnessing the person's networks in order to facilitate full participation in community life; for example, connecting the person with the local neighborhood activities (O'Brien and Sullivan, 2005).
- Social workers also take the time to understand the meaning systems of people with learning disabilities including building an understanding of the way in which context shapes their daily lived experiences. This involves understanding how political, social, economic, religious, and cultural factors influence and shape daily lives and includes an analysis of how these have restricted or opened up possibilities for the disabled person (Munford and Sanders, 2008).
- In building successful collaborative support partnerships social workers need to understand their key roles and the values, knowledge, and skills they bring to these partnerships. Central to this is their value orientation which requires them to interrogate their own beliefs about participation, citizenship, and social justice. It also requires them to have a theoretical understanding of the perspectives that have informed the provision of services to people with learning disabilities combined with a knowledge of the policies that determine how services are organized and resources are allocated. Their knowledge and skills will incorporate understanding about the psychosocial experiences of living with impairment and includes an ability to work at the individual level. They may also be required to work at the wider community level in advocacy roles and also participate in social change initiatives alongside people with learning disabilities (Sullivan and Munford, 2005).
- Social workers adopting collaborative approaches need to critically examine their own spheres of influence and whether they are able to be allies alongside disabled people in their struggles to achieve full participation. Social workers may find themselves in conflicted positions where they will be required to challenge other professionals in order to facilitate access to resources for disabled people. Understanding policy and service allocation processes and the impact of these on practice are important elements in being able to adopt collaborative approaches; social workers need to have clarity around their own positions in order to be effective. They need to strive to be genuine and authentic

with people with learning disabilities including being honest about the roles they are able to take on.

- Social workers can have a key role in advocating for integrated services; such services embrace collaborative practice and encourage cooperation and the sharing of knowledge and resources. Within integrated approaches services are prepared to engage differently with their communities and to work in partnership with other services in order to ensure that service provision is responsive and flexible. These services have a commitment to finding innovative solutions to intractable issues by working together to confront the barriers that prevent people with learning disabilities gaining access to resources and opportunities for participation. Such services work in close partnership with disabled people in order to receive ongoing feedback about their performance and the role they can have in more effectively facilitating access to resources (Munford and Bennie, 2009).
- Building on the above, a key element of collaborative practice is sharing knowledge and experience. Here there is recognition and acceptance of the diverse experience and learning that informs support relationships. At the heart of effective support relationships are respectful learning relationships. This idea gives effect to the notions of reciprocity, mutuality, and interdependence which create connections and solidarity between disabled people and others, such as social workers. This idea of shared learning invokes the notion of interdependence; it may require a change in thinking on behalf of social workers who need to position themselves as learners as they join with disabled people to learn about what is possible in terms of service delivery and participation in community life (Munford, 2012; Ward, 2011).
- Collaborative practice requires a strong value base that is built on a commitment to being future-focused and to thinking about what is possible for people with learning disabilities. It requires social workers to keep to the forefront of their practice ideas about citizenship and what constitutes inclusion and full participation in community life. This requires ongoing critical reflection on practice; this reflection should be an integral component of practice as it enables social workers to think deeply about their practice and to always remain open to new possibilities. Importantly, reflection on practice reminds social workers to reflect on their role in the support relationship and to ask themselves whether in their daily encounters with people with learning disabilities they are 'allies in emancipation' (O'Brien and Sullivan, 2005).

Conclusion

This article has explored social work practice and the experiences of people with learning disabilities. It began by outlining the definitions currently in use in this field of practice and then moved to a consideration of philosophical and theoretical perspectives. It explored how these perspectives had changed over time and that alongside these changes to thinking about the experience of disability were changes in policy and service delivery. Policy agendas around the globe have determined how services for people with a learning disability are to be provided. Both the policies and the resultant services have undergone major changes including the movement of disabled people from large isolated institutions into community settings where they have been encouraged to fully participate in community life. Social work practice has been influenced by changes to the theoretical perspectives, policy frameworks, and service delivery models; at various times social workers have been required to be gatekeepers of resources while at other times they have taken on support roles and have become involved in advocacy work and social change initiatives. The section on the social work role discussed the key elements of this role and also highlighted the challenges faced by social workers as they sought to form collaborative partnerships with people with learning disabilities and their families. This section explored the perspective of strengths-based practice which has had a major influence on social work practice with disabled people and their families. The article concluded with a discussion on the key principles that inform collaborative practice; this orientation to practice enables social workers to work alongside people with learning disabilities to achieve citizenship and full participation in community life.

Abstract

This article covers the role that mathematical modeling and associated graphical representation have had in the study of animal and human learning. Starting with the nineteenth century, the account moves rapidly to post–World War II developments in the field, ending with the major contribution of W.K. Estes and his influential theory of stimulus sampling.

Historical and Conceptual Arguments, and Contexts

The topic of this article can be construed in either a narrow or a broad historical fashion: the latter approach is taken here since a key worker in the field, W.K. Estes, has already provided a more focused and insider's view in the first edition of this *Encyclopedia* (Estes, 2001). It is also the case that the history of recent experimental psychology scarcely exists as an academic subject, particularly the roles of mathematical modeling and certain branches of statistics in its development. Consequently, this article should be viewed as little more than a modest start in accounting for what is by now a considerable and expanding area of psychology.

This broader approach also includes some observations (where appropriate) on the key relationships that have always existed in modern psychology between mathematical models and their varied forms of representation and evaluation, including graphical representations or plots that consist of original data *and* fitted representations/models of the data. Thus, the intention of this article is to suggest that mathematical psychology is a complex argumentation that interweaves mathematical developments with tailored graphical representations whose purpose is to persuade the reader to accept a specific interpretation of the results of the joint and interacting mathematical and graphical works.

Moreover, what seems to have happened in practice is that the apparent superiority of mathematical argumentation over graphical methods is often reversed, with the graphical frequently bearing the important results and conclusions; this is particularly the case with the work of C.L. Hull, as will be seen later when the rhetorical role of one approach against another is discussed. It could also be argued that in the case of two important players, Bush and Mosteller, at least one of their reasons for providing plots as well as mathematical analyses was pedagogical in nature since their 1955 book is clearly designed and laid out to be as much a teaching resource as an exposition of their approach.

The contention here is that such representations, which mix data and models, are the key to grasping the history of experimental psychology's attempt to achieve what has generally been conceived of as a scientific understanding of such fundamental operations as learning and memory. In other words, the mathematization of psychology was usually judged by insiders to be one of the cornerstones of a scientific psychology. Of course, most psychologists, being in the ever expanding and conceptually ambiguous areas that now make up their subject, might well balk at this interpretation. Nonetheless, the small pool of mathematical insiders would probably concede that while the wider psychological community has to deal as best it can with highly intractable material, such as complex problems of mental illness, eventually even this will succumb to the former's mathematical wiles.

Mathematics and Psychology in Practice

We begin with something of a paradox: for most psychologists, whether the earliest self-conscious practitioners of this 'art and sullen craft' in the nineteenth century, or today's computer literate and neurologically savvy experts, their only encounter with mathematics would be through the statistical analyses of their data. Now, for those mathematicians who developed this field, psychology was only one of many areas to which they applied their efforts. An early pioneer of statistics, and one of the most important and influential mathematicians who worked within it, was R.A. Fisher, whose principal area of application was agricultural research. Yet psychologists throughout the world daily make use of the method that he termed the *analysis of variance* (ANOVA). Moreover, ANOVA (and related techniques such as MANOVA, or *multivariate* ANOVA) have been construed by statisticians since the 1940s as examples of model building and testing analogous to the processes covered in this account.

On the other hand, model building in psychology as an explicit process attracts only a tiny handful of mathematically sophisticated psychologists and sympathetic statisticians. The situation is, therefore, very different from that of physics, where theoreticians and experimenters play a more complementary game. Psychology has never been as conceptually coherent and as focused as physics, although at different times and different places in its history it has often wished to be so viewed. Thus, in recounting the development of the mathematization of a tiny area of psychology, the reader should be aware that what they are seeing is only one out of a myriad ways of thinking about and doing psychology. And, of course, since insiders, like any other victors, usually write the history, so accounts of the past are determined by those who practice the arts of today. A relevant example here is the nineteenth-century German philosopher G. Fechner, whose simple law ($S = k \log P$) underlies modern

psychophysics (here S is Sensation, P is a Stimulus value, and k a fitting constant). Fechner's purpose in developing this simple relationship was to find support for his philosophically grounded conjecture that measurable actions or judgments by the human soul could be directly expressed in external, physically defined, and measurable aspects of the world (apart from the simple log transform of this latter aspect). Here, a philosophical/metaphysical concept (*monism*, as distinct from *dualism*, which argues that the soul is separate from the world) is being expressed and tested in an experimental and mathematical form. Yet the history of modern psychophysics rarely, if ever, acknowledges the original philosophical basis of the work and routinely applies such methods to many areas both inside and outside psychology. Thus while Fechner had some form of intellectual justification for his mathematical work (here the need to demonstrate a simple isomorphism between the organism and the world), the attraction of psychophysics more generally was of its utilitarianism and consequently of its lack of any particular intellectual commitment or history.

The point is that mathematics (and its supporting offshoots and surrogates such as data displays and graphs) is, for the experimenter and theorist alike, at its most useful and persuasive when it is linked to some form of relevant and accepted reality. This does not mean that coupling a mathematical operation or element to aspects of the observable world endows it with an unquestioned authority or completeness, but it does provide a certain increased power to represent and manipulate certain relevant aspects of the world, as will be seen. It also encourages the user of such models and representations to predict, and perhaps (for followers of the neo-behaviorist B.F. Skinner) control, an organism's behavior.

The latter part of the nineteenth century saw H. Ebbinghaus's work on memory (which is the first area covered by Estes, 2001). Ebbinghaus was interested, among other things, in memory loss over time and used himself as an experimental subject (1885/1913). The decline over time in his ability to hold three-letter nonsense syllables in his memory was expressed as an equation fitted to a version of the data, in the same way that Fechner had done (and the physiologist E. Weber, who was one of Fechner's inspirations, had done even earlier). Fitting a curve to his data would nowadays be referred to as *empirical curve fitting*.

In Ebbinghaus's hand-fitted equation $b = 100k/((\log t)^c + k)$, b is a retained memory score, t is the time between learning and testing, while k and c are constants (but, see below). Although he does not report what nowadays would be referred to as 'goodness of fit measures,' he does comment on whether the deviations of the observed from the calculated values fall within the limits of what was termed at the time 'probable error.'

Strangely, as Estes (2001) points out, although Ebbinghaus had put considerable effort into arriving at his equation and the empirical estimates of its parameters, he was reluctant to attribute much significance to the result 'at the present time' (1885/1913, Ch. 7, end of section 29). In other words, Ebbinghaus fitted a mathematically defined curve to his data, though without, somewhat paradoxically, seeing the potential of the exercise. But what if Ebbinghaus had tried to plot out the data and his fitted curve? This would have allowed him to appreciate aspects of the results that were not easily discernable from the raw data alone. Eyeballing the plot, therefore, immediately reveals several points of interest: in particular, the amount remembered b, as a percentage of correct recall, tested at increasing time intervals after the initial learning does not show a straight line reduction with time, rather it is a complex curve that rapidly descends from the initial testing time to 2 days after this point, with the curve staying almost flat up to the final time of 31 days after the first test. The score at 2 days is about 30%, while at 31 days it is about 25%. Notice here that Ebbinghaus must have systematically tried out values for the two constants t and k so as to maximize the fit of the curve to the data.

At this stage, of course, the formula has only empirical validity, in that it fits the data in hand, but one could begin *post hoc* to think of other experiments that take into account or build upon the results of this initial analysis. From such a standpoint one could also start to think about the meaning of the phenomena, or at least a more systematic exploration of the situation and the collection of experimental regularities. However, what was ideally needed was a psychologically/substantively grounded system that would generate numerical outcomes and their plots; in other words, the requirement would be to employ a rational process of matching plot to data via a theory, rather than the ad hoc one of empirical curve fitting after the data had been safely gathered in.

This curve-fitting approach then inspired an increasing number of workers, particularly in the United States, to experiment with trying out a variety of curves to a range of memory recall results. However, even where a more recent player in this story claimed to be offering a theory-based curve-fitting exercise rather than an empirical one, it is still the case that basic processes in his scientific system involved fitting empirical or even subjectively produced curves as a fundamental part of his conceptual and methodological work. This person is the learning theorist C.L. Hull, whose research from the 1930s until his death in 1952 figures prominently in Estes's earlier contribution to this *Encyclopedia*. According to Estes, "Hull (1943) set forth a series of axioms for a general theory of conditioning and elementary learning" (Estes, 2001, p. 9392). What Estes concentrates on in his brief account of Hull's work are the putative outcomes or purposes of the work, while omitting the grand, all-embracing sweep of Hull's theoretical efforts, whose final outcome was intended to be (to echo the title of his final work) *A Behavior System* (Hull, 1952).

Hull's system consisted of a complex of interacting processes and stages in determining the acquisition and storage of a range of material, all teased out using a variety of experimental tasks and routines. What Hull used extensively as a method of representation, argumentation, and insight was a large array of fitted curves (see particularly Hull, 1951). However, as was implied earlier, his a priori selection of and devotion to exponential functions in particular and the rather interesting way in which they could be augmented and conceptually enhanced show that at least with this foundational aspect of his work Hull was more empirical than rational where one can detect no less than six graph fitting stages between raw data and finished plot (see Lovie, 1992, p. 102). Lovie also analyzes, in some detail, a similar scaling and curve-fitting exercise undertaken by the social psychologist C.I. Hovland, who was, in the late 1930s, a much-valued graduate student of Hull (Lovie, 1992, pp. 68–70).

The outcome of these exercises by Hull and Hovland was the successful fitting of one form or other of an exponential function. Now, in many ways such a function has an obvious and direct appeal to those interested in learning, for instance, as the dependent variable such as time or trials progresses, so the organism learns the material making up the task fairly quickly (say, learning a list of nonsense syllables or running a maze, and eventually mastering the task, so the error rate flattens out at zero or the running time reduces to a fixed minimum). If some measure such as errors is plotted cumulatively, the curve climbs at first but then finally flattens out and asymptotes at some fixed value. An exponential function looks a priori plausible here, since most tasks can be attained eventually, and most people/organisms experience a rising success score with most problems as they apply themselves to the task (providing that the problem is soluble).

Hull was quite happy to proceed in this ad hoc manner, perhaps because he could also control the curve-fitting routine, thus achieving agreement between data and the mathematical models generating the curves. It is also the case that goodness-of-fit tests were increasingly available at this time, but Hull still chose to eye-fit his curves, perhaps because he had only a tiny number of data points available, which would have ruled out current goodness-of-fit techniques that were notoriously data hungry, but it also could be argued that the use of such tests would have removed Hull's control over the fitting process and the interpretation of its outcomes. Finally, it is also true that Hull was happy to extrapolate the extent of his data fitting many times further from the values of his limited data set, while he also claimed a symmetrical extension of such curves over experimental values not even tested by his student Hovland (see Lovie, 1992, p. 100). A similar ambiguity over the use of goodness-of-fit tests is also evident in later and more mathematically sophisticated contributions by Bush and Mosteller (1955).

Finally, Hull was fiercely attacked by S. Koch in 1954 in what was an otherwise positively toned, multiauthored volume entitled *Modern Learning Theory*. Hull, whose influence was still strong until at least the end of the 1950s, was equally fiercely defended against Koch's onslaught by F.A. Logan in a 1956 review of the book. In addition to referring positively to Hull in 1959, Estes, who clearly viewed him as his intellectual predecessor, concluded his 2001 essay by pointing to Hull's ideas as the foundation for modern cognitive psychology. He also praised Hull in the same article as contributing positively to recent interpretations of Pavlovian conditioning.

Our penultimate study is of Bush and Mosteller's (1955) book *Stochastic Models for Learning*. The book itself is divided into two unequal sections, with the larger initial part devoted to the necessary mathematical ideas that would then allow the reader to make more sense of the second, where some five data sets were exposed to lengthy mathematical analyses. Thus modern mathematical and statistical ideas, such as matrix methods, parameter estimation and the properties of modern estimators, mathematical operators, sequences, Markov chains, discrete mathematics, and moment-generating functions, are all explored in elegant and (for anyone prepared to work hard enough) accessible treatments of the material.

Above all else, however, the book rigorously pursued the probabilistic or stochastic approach to behavior, which explicitly accepted the fundamental uncertainty of the world but also allowed one to understand such a place provided certain assumptions were made about it, for example, that successive responses were independent (or, more generally, that any state was dependent only upon the previous one, material learnt or not learnt, for instance), or that it did not matter in what order a specified state was achieved (so-called path independence assumption). This approach differentiated it from Hull's theorizing, for example, where the dependent variable was usually the response alone, not the *probability* of the response.

Unfortunately, most of empirical studies subjected to such heavy weight analyses seem far too trivial and out of the mainstream of the experimental psychology of the period to be of much interest to the average experimental psychologist, with only Solomon and Wynne's classic study (1953) on avoidance conditioning in dogs representative of mainstream experimental psychology (and perhaps the disappointing analysis of rat running times from a 1954 study by Weinstock). Even here, however, Bush and Mosteller deliberately chose to analyze simple, binary-coded avoidance responses (*avoid, not avoid*), a measure that Solomon and Wynne themselves had rejected as almost meaningless, since in practice it had yielded little, if any, useful response variance (see Lovie and Lovie, 2004, for a more detailed analysis).

Consequently, what we have here is still an (admittedly) nuanced and mathematically sophisticated form of curve fitting, since there is little attempt to derive the various formulae from theoretical psychological considerations except of the most obvious or banal kind, for example, dogs in the two-chamber shock avoidance task will quickly learn to jump from the shock chamber into the safe one when the unconditioned stimulus sounds. Further, the major criterion of success used by them was (rather ambiguously) both an unstated measure of the degree of fit, or a simple eyeballing of the plots of theory and data, with an invitation to see how close the agreement is visually (Bush and Mosteller, 1955, pp. 250–251). Some of the other applications yielded tractable goodness-of-fit tests, but others did not so simple eyeballing had to do. It is also worth noting that the least satisfactory analysis was that for the Weinstock data since their model was unable to capture the tails of the run time data.

But were there any psychological theories at the time able to suggest anything more than mean differences between experimental levels, or at best the overall form of the learning curves, for example, rising fairly steeply with practice, then leveling off as the material was learnt to some criterion? In other words, was there a group of experimental psychologists comparable to the physicists who could work productively with their theoreticians? The answer then and, probably still, now is 'no.' Perhaps the productive interaction as between theoretical and experimental physicists is an inappropriate paradigm for psychology. Certainly, the mathematical skills needed to understand and benefit from Bush and Mosteller's text are not trivial; perhaps they mistook either the mathematical skills necessary or the amount of training and commitment needed before such mathematical psychologists were thick on the ground. Either way, the book (which appeared as part of the prestigious series *Wiley Publications in Statistics*, though not, notice, in psychology) did not achieve any major recognition

within psychology, even though it is both stimulating and clearly written as was the case with all Mosteller's works. It was also obviously structured as a teaching aid, but it is less clear for what audience; perhaps Bush and Mosteller were hoping to create such a teaching area. The problem is that it was mainly written by an outsider, Mosteller, who had considerable mathematical skills but less commitment to psychology.

There is also the problem that was raised in the rather neglected final chapter of Bush and Mosteller. Here they note that since any reasonably sized data set can yield an enormous number of descriptive statistics, the problem becomes how to make sense of these summary numbers, which means that the psychologist must have some theory-based criteria as to what measured outcome is relevant to that theory and what is not. One further issue that arises here is that if there were theories in psychology that were expressible as numerical summaries (or parameter estimates) that had been arrived at independently of the data set of interest, then one would be able unambiguously to test any viable mathematical hypotheses using that data set. However, if the estimated numbers were both based on the present data set and used to test out hypotheses about this data, then one cannot assert the independence of these conclusions; thus a different set might yield a different conclusion, and there would be no way of saying which was the better result. Even Bush and Mosteller's own worked examples could be said to violate this rule, so conclusions drawn from their model/data were ambiguous, at least using their test of independence of conclusions (see Lovie and Lovie, 2004). It is therefore not too surprising that Mosteller at least quickly busied himself with statistical projects outside psychology.

Our final researcher is W.K. Estes. He, unlike Mosteller, was trained as a psychologist, at one time serving as a research associate of Skinner. Although he had published work on animal learning, the most influential phase of Estes's work was begun in 1950 when he produced the first of many papers outlining and developing what he later termed *stimulus sampling theory* (SST). Like the parallel work by Bush and Mosteller, this offered a probabilistic account of conditioning and learning where this was conceived within the learning theories of its time, thus it is possible to see echoes of I. Pavlov, E.R. Guthrie, Hull, and, of course, Skinner in his work, who together offered a complex dish made up of simple contingency (Guthrie and Pavlov), blended with some leavening of reinforcement and probabilistic responding (Hull and Skinner). Although some commentators (e.g., Cox, 1997) have limited his sources of influence to Guthrie, while, as noted earlier, Estes himself also cited the foundational role of Hull, who had emphasized the importance of reinforcement in learning.

SST can best be described as a probabilistic and dynamic recasting of basic stimulus–response learning theory. Thus, on a particular trial a stimulus is sampled at random and a single response (also randomly sampled) is associated with it. On subsequent trials these connections made between specific stimuli and responses may or may not persist, thus eventually generating a probability distribution over all such pairs over trials (the assumption here being that both stimuli and responses are finite in number, and hence the number of possible pairings is finite as well). Finally, a random number of such pairings are made on any one trial, a number that can also change at random from trial to trial. Put this way, SST, because of its highly abstract nature, was not an approach that could be directly or easily tested on particular learning situations.

However, so broad an approach can potentially be generalized to many situations, which is what happened over time. Estes also explored various possible features of such differing realizations, for example, the effects on SST of learning in a conditioning experiment or the differential impact of using simple or compound stimuli (Estes and Burke, 1953). The effects of (spontaneous) stimulus variation on the mathematical description of a range of learning phenomena such as spontaneous recovery, regression, and the effects of trial spacing can all be captured simply within a generalized SST framework (Estes, 1955a, 1955b). Suddenly, the one approach provided by SST meant that significant areas of classical learning theory could in principle be rescued from the qualitative speculations of Skinner and Guthrie, or the quasi-quantitative ones of Hull. Of course, to accept SST one had also to agree that a modeling approach yields more scientific information than the more traditional, informal, and qualitative ones, but Estes's wish for psychology to emulate physics makes it clear on whose side his sympathies lay (Estes, 1959). Note too that the stimulus for the approach adopted by both Estes, and Bush and Mosteller, came directly from modern, post-Einsteinian physics, with its conceptual foundations firmly planted in an uncertain and probabilistic worldview. (A question that arises at this point is whether the world is intrinsically uncertain, or if it is our knowledge of the world that is incomplete, and thus only apparently uncertain.)

The problem in the longer term, however, was that while SST made a moderately successful attempt at outflanking just about every alternative approach in classical learning theory, it was not so general as to be able to do the same for the cognitive juggernaut that was, even in the late 1950s, beginning to build up a ferocious head of steam. So SST went the way of the dodo, rather like Bush and Mosteller's efforts, but not for the same reasons. Thus, while the latter espoused no particular substantive approach to psychology, Estes, in the end, backed the wrong elderly horse (see, however, Bower, 1966, p. 379, and also Bower and Hilgard, 1981, p. 251, while acknowledging the decreasing impact of SST, nevertheless put a slightly more positive gloss on its survival).

In the End

Estes's extended coverage of SST in 1959 represents essentially the last major outing of the system as a main influence on either theoretical or experimental psychology. What lay before psychology was the growth of cognitive approaches and the computer analogy. This offered so many actual and potential riches to psychologists, and fitted in so nicely with the (non-behaviorist) direction of its future path, that it was taken up with enthusiasm by many young researchers, particularly in the United States and the United Kingdom. There was also a conscious effort by these young workers, drawing on the notion of a scientific revolution put forward by T.S. Kuhn in 1962, to argue that cognitive psychology represented just such a revolution, and hence any behaviorist ideas could be rejected out of hand as lying on the wrong side of the

conceptual gulf (see Lachman et al., 1979, for a mature assertion of this Kuhnian position).

Estes's continued commitment to behaviorism generally (as embodied in his system of SST) and to Hull in particular, has largely consigned his work to the past. Mathematical psychology, however, has continued as a minority taste, though its survival may well be dependent on how far it keeps itself relevant to developments in psychology at large. Indeed, there is no significant evidence of the symmetrical two-way traffic between theorists and experimenters in psychology that can be found in physics. Bush and Mosteller's conception died almost as soon as it was born because they ignored this precept, while Estes, who lasted a little longer, still lost out as the conceptual wind changed. Further, Skinner, who invented the most successful and long-lived form of behaviorism yet seen, eschewed any form of mathematical modeling other than the plotting of cumulative records that 'speak for themselves,' as he might have said.

Finally, one stumbling block restricting the translation of mathematics into psychology was the technical limits to the subject, that is, the issue of 'tractability,' for example, the problem of finding closed, finite solutions to the various mathematical functions investigated. It is likely that Bush and Mosteller's assumption of path independence, for example, had to be made because, at the time, the mathematical problems raised by any alternative propositions could not be solved with the mathematical insights or tools available to them. Any systematic branch of learning faces both technical and conceptual limitations that help shape what can and cannot be claimed.

Abstract

Organizational learning is a relatively recent metaphor for the organization that matches two concepts – learning and organization – and enables exploration of the organization as if it were endowed with a stock of knowledge, skills, and expertise. A short history of the concept will illustrate its development in organization studies. During the 2000s, not only did attention to processes and temporality increase, but also an epistemology of becoming appeared where the boundaries between learning and knowing, order and disorder, organization and organizing became conflated. Knowing took the place of knowledge, and instead of considering knowledge as an object or a resource, the concept of knowing makes it possible to see it as a collective knowledgeable doing that is situated in working practices.

Introduction

Organizational learning is a metaphor for the organization that matches two concepts – learning and organization – and enables exploration of the organization as if it were endowed with a stock of knowledge, skills, and expertise. It enables exploration of the organization as if it were a subject that learns, deals with knowledge, and reflects on experiences.

A metaphor works by matching what is distant with what is close; that is, similar features with dissimilar ones; and it is a cognitive tool that develops creativity and social imagination and reveals the importance of language and symbols in the construction of reality and in the formulation of theory. In this way, cognitive transpositions come into operation that make it possible to imagine and to talk about the object in question (the organization) as if it were another already-known object (learning).

Therefore, the study of organizations as if they were systems of knowing and learning may be of assistance in the design of knowledge-intensive organizations and of networks of organizational practices that create and transfer knowledge. At a theoretical level, the representation of learning in organizations may stand as a valid theoretical alternative to the rational organization because it replaces the classical concept of the organization that acts according to the principles of rational choice with that of the organization that acts according to principles of experimentation, of trial and error, of success and failure, and of discovery and invention. Nevertheless, we shall see how in the historical development of the field, several streams of research have arisen from controversies on how to understand what constitutes knowledge and why it should be studied (to manage it or to understand it).

The following sections outline the history of the concept of organizational learning, the divergences within the field of learning and knowing as they grew in the 1990s, and further developments in the field.

A Brief History of the Concept of Organizational Learning

The first mentions of the concept can be traced back to March and Simon (1958), but it was for long peripheral to organizational theory. March has always alluded to learning and to the link between learning and decision-making processes, although only few of his works are specifically devoted to this topic. This inquiry, which was sociological, continued with Cyert and March (1963) and conceived learning as changes in organizational routines that affect future behavior.

The study generally recognized as pioneering the field is by Argyris and Schön (1974), and it illustrates how researchers interested in knowledge have examined specific organizational phenomena in terms of learning defined in a variety of ways:

1. *As learning curves*, a concept that rests on the principle that the man-hours required to produce a unit of output decrease in proportion to the experience accumulated. Productive processes display characteristic learning curves in relation to a set of organizational factors.
2. *As behavioral change through trial and error*. Learning is a self-regulating process that detects errors and corrects them or, if preferred, checks actions against their outcomes and makes appropriate adjustments to subsequent actions.
3. *As adaptation to the environment*, and therefore as the capacity to 'fit in,' to adjust to external stimuli that must be discovered opportunely and rapidly. Learning is therefore synonymous with structural change and acts as a signal of successful evolution.
4. *As economy of search*. The economizing of cognitive energies in problem solving has been demonstrated within this stream of research. New solutions are first sought in familiar settings and then, because the costs of the search increase proportionately, in progressively more unfamiliar ones.
5. *As the modification of mental maps*. Since Argyris and Schön (1974) pointed out the gap between what organizations say they do (exposed theory) and what they actually do (theory-in-use), learning has resided in the ability to bring explanations and the ideas guiding what is done into alignment with the organizational changes introduced.

Since its early theorization in the 1970s, the concept of organizational learning has related to the management of organizational knowledge in relation to change in cognition and beliefs or in behavior and action. It is argued that one of the main shortcomings of the concept of organizational learning is that the traditional psychological models of learning

(based on stimulus-response theory) have been transferred acritically to the study of organizational learning, and with them a realist ontology. An authoritative commentator has remarked that "people in organization theory began to talk about learning … just about the time psychologists began to desert the concept" (Weick, 1991).

The growth of the field began in the 1980s, and for most scholars of the time, organizational learning and its cognate concept the learning organization were linked to change in organizational knowledge as a function of experience. Although the two terms (organizational learning and the learning organization) were broadly accepted, there was little consensus on their meaning, and their ambiguity served to separate two communities of scholars pursuing different research interests (Easterby-Smith et al., 1998).

Two bodies of literature developed according to whether the aim was analytic and descriptive or action oriented and prescriptive. The former focused on 'How does an organization learn?' The latter focused on 'How should an organization learn?' Peter Senge (1990), to whom the term learning organization is attributed, worked around two main questions: How can we build organizations in which continuous learning occurs? And what kind of person can best lead the learning organization?

From the late 1980s to the beginning of the 2000s, a comingling of several streams of research occurred (Argote, 2011) and a focus on organizational processes captured the attention of a large number of scholars. For the latter, the concept of organizational learning related to strategies and mechanisms to develop and exploit the learning capabilities of employees (Senge, 1990) in ways so that organizational performances improve.

The organizational processes that attracted the most attention were as follows:

1. *Knowledge creating*, which relates to the activity that occurs inside organizations to generate new knowledge (Huber, 1991) and directs attention to how knowledge is co-created (Antonacopoulou, 2009) and how creativity may affect the elaboration of experience. The study of knowledge creation subsequently linked with organizational creativity and creative industries (Kazanjian and Drazin, 2012), while the following two subprocesses initially interested more scholars (Argote, 2011).
2. *Knowledge retaining*, the process by which organizational knowledge persists through time (Kieser and Koch, 2008) or decays. Especial interest developed around transactive memory systems (Hollingshead, 2001).
3. *Knowledge transfer*, the process that analyzes the mechanisms whereby knowledge may or may not transit from one organization to another (Hansen, 1999), and in relation to competitive advantage and strategic behavior (Teece et al., 1997).

We may say that, historically, the relation between organization and learning has been explored in terms of change, under the influence of psychological models of learning transferred to organizations, and in terms of an intrinsic quality of organizational performance, be it an identity as in the learning organization or in organizational routines as a source of competitive advantage. The polysemy of the term 'organizational learning' may explain the richness and diversity of the studies conducted under its aegis.

The Growth of the Field and the Widening Divergences within It

The growth of the field of studies centered on the organization-as-learning metaphor may be understood in several ways, both internal to the ambiguity of the concept that explains its plasticity, and in relation to the expansion of the knowledge society, economy, and technological innovation. While an attempt was made to unify the field within a well-defined framework (Crossan et al., 1999), and while much debate was conducted on what organizational learning 'is,' new research directions emerged from the proliferation of definitions and ways to frame the object of research and the changing context in which it was studied.

In a scenario of rapid economic and technological changes, knowledge came to be seen as an invisible asset, and many consultants and firms caught on to the commercial significance of organizational learning and the managerial interest in bringing knowledge under control at the service of production or innovation. The speed of technological change means that there is constant pressure on firms to reduce the time from the conception of new products to their launch, and communications innovations mean that companies, and the knowledge workers within them, may have to adapt radically and in unforeseen directions. As a consequence, firms cannot rely on established practices: they need to learn new ways to do things. The advance of globalization is an additional source of pressure. It began with the opening up of labor markets in Asia in the early 1980s, and in Central Europe in the late 1980s, and it has accelerated with the establishment of global financial markets and global consumer markets fueled by the spending power of new middle classes in emerging economies such as India and China. In order to compete on a global scale, companies must radically increase their scales of operation in order to keep up with the evolution of new technologies and businesses anywhere in the world.

The preceding factors have generated a widely held view that the most important contributor to corporate competitiveness in the future will be the ability of each organization to learn faster than its rivals. The exploitative ethos is particularly evident in the economics of knowledge and knowledge management, whose starting point has been identification of knowledge as a production factor distinct from the traditional ones of capital, labor, and land. The resource-based theory of the firm has conceptualized knowledge as 'core competencies' or 'core capabilities,' naturalizing the relationship by means of the metaphor of the tree of knowledge: the trunk and major limbs are core products, and the root system is the core competence (Prahalad and Hamel, 1990). The reification of knowledge has grown more overt with the 'objectified transferable commodity' envisaged by the knowledge management approach, which treats knowledge as practically synonymous with information created, disseminated, and embedded in products, services, and systems.

In a way similar to the controversy between organizational learning and the learning organization, a new controversy arose

in the 1990s between organizational knowledge and knowledge management. Whilst the former was more focused on understanding how knowledge is created through the transformation of tacit and explicit knowledge, the latter focused more on managing learning and knowledge. Whereas Nonaka and Takeuchi's (1995) book became the reference point for both stating and criticizing this conception of knowledge transformation within an academic milieu, in the field of consultancy the idea of managing knowledge was put forward in relation to the potentialities of information technology (IT) systems and the reuse of knowledge.

The dilemma – as March (1996) expressed it – is between exploration and exploitation in the use of knowledge. The same dilemma is also reflected in the way knowledge is conceived and situated in the relationship between the knowing subject and the object of knowledge. In order to illustrate a different direction that the field of study took after the 2000s, we need to go back to Weick and Westley's (1996: 440) definition of the concept of organizational learning as an *oxymoron*: 'organizing and learning are essentially antithetical processes,' since organizing is linked to processes of ordering while learning recalls disorganizing and increasing variety. How can the two processes happen at the same time?

From Organizational Learning to Knowing in Practice and Becoming

The semantic shift that involved the increasing substitution of nouns with verbs in organization studies from 1996 onward (Clegg and Hardy, 1996) was accompanied by a different epistemology with a different way of looking at organizational phenomena. Instead of organization, many scholars preferred to look at organizing and, instead of knowledge, to investigate knowing. This line of inquiry into the nature of knowledge and its changing status in contemporary society is the continuation of the epistemological debate that Cook and Brown (1999) represented in oppositional terms as an epistemology of possession, constructed around the vision of knowledge as an object, and an epistemology of practice, where practices are the sites of knowing, learning, and organizing.

During the 2000s, not only did attention to processes and temporality increase, but also an epistemology of becoming appeared where the boundaries between learning and knowing, order and disorder, organization and organizing became conflated. Knowing took the place of knowledge, and instead of considering knowledge as an object or a resource, the concept of knowing makes it possible to see it as a collective knowledgeable doing that is situated in working practices.

The relation among learning, becoming, and organizing has been explored in order to illustrate how the three concepts can be conceived as verbs that perform themselves. They can be 'understood as an 'intelligent life in between' in that it oscillates between complexification and simplification, de- and re-construction, de- and re-territorialization' (Clegg et al., 2005: 158). Learning is therefore considered as taking place in between order and chaos, as the oxymoron that organizational learning illustrates. Within an epistemology of becoming, organizations are not treated as separate entities or accomplished events, but as enactments, as unfolding processes (Tsoukas and Chia, 2002).

During the same years, and within similar debates on knowledge, the so-called practice turn (Schatzki et al., 2001) contributed to a resumption of the concept of practice in organizational theory; and from the field of organizational learning, which rediscovered the concept, came a new solution to an old problem. Practice became the third way between a mentalistic and cognitive model of learning in organizations and the commodification of knowledge performed by knowledge management. Knowing in practice is a way to study knowledge as an activity and to look at it as it happens. Its main questions are "How do people 'do' knowledge as a collective endeavor?" and "How is knowledge transformed when it is being used?"

From the beginning of the 1990s onward, the stream of research put in motion by a social learning perspective (Brandi and Elkjaer, 2011) continued through the success of the concept of communities of practice (Wenger, 1998). Its subversion in favor of the idea of the practices of a community formed a 'bandwagon of practice-based studies' (Corradi et al., 2010) around the ideas that practice is the site of knowing and that learning takes place within sociomaterial relations (Orlikowski, 2002).

Practice is the concept that allows the processes of 'knowing' at work and in organizing to be articulated as historical, material, and indeterminate processes. In practice-based theorizing, different traditions in the study of learning converge without losing their identity: situated learning theory offers the concept of community of practice, actor–network theory brings the idea of knowledge grounded in materiality, activity theory offers a pragmatic theory of action, and workplace studies, with their ethnographic study of knowledgeable communities, bring a research method that is anti-individualistic.

In regard to future directions for research on organizational learning, there are as many directions as there are lines of inquiry. Nevertheless, the second edition of Easterby-Smith and Lyles's handbook contains an interesting observation on the lack of research on actual learning processes and knowledge, since these have been mainly considered as dependent variables influenced by other phenomena. This is because, according to Easterby-Smith and Lyles (2011: 15), "we do not know the constructs that influence knowledge or learning utilization," and because real-time learning poses numerous methodological questions, we can expect that the field will continue to grow and host further controversies.

Abstract

This article is an introductory review of learning philosophies and theories directly associated with human learning. We present an introduction to educational foundations followed by major sections on the two foundational areas of learning philosophy and learning theory. The focus of this article is on educational foundations; the goal is to help the individual understand the foundational relationships between learning philosophy and learning theory. The purpose is to set the underlying principles by which learning decisions are made.

Introduction

This article provides a review of the learning philosophies and theories directly associated with student learning. Our goal is to present sufficient information in the subject areas of learning philosophy and learning theory so that individuals can begin employing theories of learning without first having to acquire formal and disciplined study in educational foundations. However, it is not our intention to replace or to negate the importance of formal study in educational foundations. Rather it is our hope that the educator will seek out additional study in this important domain of instructional theory. That is, this article should provide a means for educators to formalize their personal educational foundations in the areas of learning philosophy and learning theory.

We first present an introduction to educational foundations followed by major sections on the two foundational areas of learning philosophy and learning theory.

The focus of this article is on educational foundations; the goal is to help the individual understand the foundational relationships between learning philosophy and learning theory. The purpose is to set the underlying principles by which teaching process decisions are made.

The *Why* and *How* of Learning

Philosophy provides the *why* for learning theories. From that philosophical foundation or underlying belief of human learning, a learning theory describes the *how* of the cognitive system. This description of learning is typically a model that shows the basic components employed in human cognition. For example, behavioral models describe the how of the system without mentioning internal components or processes. The explanation of *why* in behavioral models range from physical needs (e.g., hungry, pain, pleasure) to placement of reinforcers to increase probability of desired behavior. In contrast are cognitive models of learning that focus on the internal variables and mechanisms to describe the *how* of cognition. The *why* is more elusive in cognitive models because of the internal nature of human behavioral control. There is the implied assumption that internal motivation factors influence progress and effort in learning. Each of these positions is elaborated in this article.

Instructional theories are prescriptive models that identify the variables and conditions that are necessary to improve learning. The variables and conditions defined in instructional theory are in large part the products of their underlying learning philosophy and learning theory. The robustness of an instructional theory therefore is in direct relationship to the scope and depth of the learning theory. The predominance of behavioral theories since the 1940s has provided a rich set of instructional theories for classroom learning. For example, the works of Skinner in transferring learning theory to instructional theory set the tone for instructional models that still dominate classroom practice. The growth of cognitive psychology and constructivism is now having an effect on educational paradigms.

Learning Philosophy

To fully understand contemporary educational paradigms, it is important to trace its roots through the rich philosophical traditions embedded in psychological history. Although the modern tradition of psychology is typically credited with a brief history, its ancient antecedents can be traced to the earliest inquiring minds of philosophers and theologians who sought answers and explanations to the workings of the human mind. Precursor inquiry into such themes as human motivation, thinking and memory, perception, dreams, and behavior established a vital continuity between these earliest thinkers and the scientific inquiry of contemporary psychological theories. Therefore, the distinction between these ancient antecedents and modern educational paradigms lies not in the kinds of questions asked, but in the methods used to answer such inquiry.

Self, Nature, Nurture, and Society

The range of explanations that philosophers have focused on in terms of human learning includes four basic constructs: self, nature, nurture, and society. Each of these constructs represents contrasting concepts for explaining human learning. However, most practical explanations of learning typically involve two or more of these four constructs.

Self

Self refers to the concept that humans have direct responsibility and regulation for the conduct of their lives: Learning is the direct responsibility of the individual. Experience is an important component of the self-regulation aspect of the human because the individual can use that experiential knowledge to make increasingly complex decisions. The concept of *self* is highly influenced by effort and progress in learning. Life is not deterministic or controlled by forces outside the self. The *self* takes on the responsibility of direction in learning, and the effort and affects necessary to learn. An important component of the *self* is the development of personal criteria for problem solving and decision making. This personal criterion arms the individual with the means for self-observation and judging. Regulation is a matter of self-monitoring and self-imposed control over external and internal factors.

Nature

Nature is the amount of control and influence that an individual's inheritance has over learning and behavior. The extreme position is that the person's DNA regulates behavior through such variables as motivation, personality, and intellect rather than environmental factors. Proponents of the *nature* explanation of learning have highly impressive empirical data to support their reliance on genetic functions to regulate learning. Depending on the specific theory, proponents of nature place the control of genes from a low of 50% to a high of above 75%. Cross-cultural studies show findings that identical twins separated at birth exhibit similar behaviors that are not due to their respective environments. In comparison to *self*, control and regulation are manifested within the constraints of the genetic variability of each individual. That is, the individual lives within the borders established at time of conception.

Nurture

In contrast to *nature* or *self* as the controller and regulator of learning, is the concept that the environment determines through conditioning what a person learns and how they behave. This *nurture* explanation is based on the influences coming from the learner's environment. For the most part, proponents of the *nurture* concept of learning maintain that behaviors are a result of environmental conditions. Given the all-inclusive role of the environment in learning, nurture proponents' favor a highly structured environment governed by constant manipulation by superiors. In other words, change the environment and you change the behavior. Learning occurs through direct manipulation of external conditioning of responses through variables such as reinforcements and rewards. In other words, others deliberately shape learning in either overt or covert controls of the individual's environment. At birth the individual is a blank slate without either predisposed genetic constraints or internal means of self-control.

Society

The fourth basic construct in explaining human learning is *society*. *Society* is a twofold construct: internal-self correspondence and external collaboration. In the latter part, cultural influences are highly regarded as shaping the direction of the individuals learning path. In the former part, the individual engages in internal cognitive discourse. The roles of internal correspondence and external collaboration explain that individual learning is a product of the interactions of these two concepts. In a sense, society features a combination of self, nature, and nurture. The debate between this construct and the other three is on degree of influences. For example, nurture implies a direct manipulation of conditioning paradigms whereas society is less manipulative and controlling; it is more self-observing of others' behaviors but being to able to be internally selective. That is, the individual is within the environment but is aware of what to take from it.

The following subsections review the evolution of philosophical thought. The goal of the presentation is to help the reader in forming their individual learning philosophy foundation. At the conclusion of this section on educational philosophy, the reader should attempt to put in writing their individual philosophy of learning. The value of a formal learning philosophy is that it is used to improve validity and consistency in the ID decision-making process.

From the earliest of inceptions forward, the waxing and waning in popularity of numerous established philosophical positions has shaped modern psychology. Deeply embedded in the *zeitgeist* or spirit of the times, the prevailing philosophical position was often upstaged when new traditions, out of protest or direct revolt, attempted to improve upon the shortcomings of the then popular position. In this manner, new philosophical positions challenged the zeitgeist and gained momentum from the established position by proposing new concepts and inquiry techniques that remained popular until a new revolution took place. Frequently, a scientific discovery, brilliant for its time, was rejected by the prevailing position only to be accepted years or decades later when the zeitgeist complimented such methods. Modern psychology, a reflection of contemporary zeitgeist, consists not of a single tradition that boasts the total truth, but a rich and complex incorporation of all that has gone before. Following next in this section is a review of the growth in philosophical explanations of the *why* in human learning.

Dualism

The origins of Western learning philosophy can be traced to Plato (427–347 BC), a disciple of Socrates, who was the first Western thinker to distinguish three aspects of the human soul that contemporaries correspond with intellect, emotion, and will. Furthermore, this philosophy, termed *dualism*, maintained a separation of the mind and body; suggesting that intellect or reason was connected with the spirit and was untouched by the behavior exhibited by the individual. Originating with Plato, this dualistic theme provides the material for much controversy throughout the history of psychology. Aristotle (384–323 BC), a student of Plato, further distinguished various psychological functions and suggested that the soul might be divided into cognitive functions and emotional and moral functions. It was not until Quintillion, however (35–95 AD) that the existence of unique variations in individual ability were suggested,

though structured study of individual differences evolved much later in history.

Reasoning

Early Christian scholars augmented the mind–body dualism proposed by the early Greek philosophers of the mind synonymous with the concept of a soul independent of physical causes. Aquinas (1225–74), a Catholic theologian, expanded on the concepts introduced by Plato by further subdividing the functions of the mind to include sensation, perception, memory and reproductive imagination, and reasoning and creative imagination. Philosophical inquiry into reason was in harmony with Western Christendom and its views of faith and study of the soul into the middle ages. At the dawn of the modern age, however, science began to challenge many of these traditional beliefs. Breaking from the traditionally acceptable truth that the earth was fixed at the center of the universe, Galileo Galilei (1564–1642) further suggested that all that existed was nothing more than particles of matter in motion. These challenges catalyzed the movement toward science and reason becoming the authority, freeing scientific inquiry from the rigid doctrines that had dominated for centuries.

Compromising the initial challenges of Galileo, French philosopher, mathematician, and scientist Descartes (1596–1650) accepted the dualistic philosophy suggesting that both mind and body are essential to the study of the totality of human behavior. Descartes further believed that humans are born with all knowledge and that the relationship between mind and body was one of intimate mutual interaction. The mind possessed only the function of thought and all other processes were functions of the body, though mind, and body influenced one another. This interactionist position established the foundation for a more extreme philosophical view emerging in England in the eighteenth century, *Empiricism*.

British Empiricism

Agreeing with the dualistic theory of Descartes, a group of British philosophers accepted the position that the mind is the seat of all knowledge, that the proper subject for the study of psychology is the mind of the human, and that the acceptable method of inquiry is empirical introspection. These British empiricists opposed the nature theory of innate ideas suggesting that all knowledge comes through the senses and that the mind grows through progressive accumulation of sensory experience.

The major proponent of the empiricist school was Locke (1632–1704), who initiated the *nature/nurture* debate by suggesting the concept of *tabula rasa* that the mind of a human is, at birth, a clean and empty slate on which experience would write. In harmony with the mechanistic concepts derived from physics, Locke suggested that knowledge reduced to its simplest particle consist of ideas that, like atoms, combine to form more complex concepts.

Law of Association

Locke's immediate successor, Berkeley (1685–1753) filled an obvious void of empiricism by introducing the concept of associations that provided the mortar that connects simple ideas into mental elements. Hume (1711–76), who established laws of the mental universe of which the *law of association* of ideas was one, further advanced this associationist theory within British empiricism. In addition, Hume differentiated the concepts of impressions and ideas.

Credited as the founder of associationism as a formal school of thought, Hartley (1705–57) collated and clarified the previous work of the empirical philosophers while additionally suggesting that the law of association was one of continuity. Carrying these concepts to a further extreme, Mill (1773–1836) applied a more pure concept of mechanism to associationist thought by proposing that the mind is merely a machine, totally passive, and void of will. This extreme position in arguing for nature influenced the later emergence of contemporary behaviorism.

Positivism

Concurrent with the emergence of empiricism as the dominant philosophical position in the mid-nineteenth century, two less powerful forces established themselves as influential to the emerging traditions. *Positivism*, a theme popular in Europe, proposed that facts be accepted only if objectively observed through the methods of science. Materialism, which supported the theory of positivism, focused on the physical aspect of mental phenomenon. As these philosophical positions interacted to shape a more empirical and mechanistic approach to the study of the human mind, psychology finally separated in the late nineteenth century from its philosophical traditions to emerge as a disciplined science.

Experimental Physiology

During the time that associationism dominated philosophical thought focusing on the importance of the senses; a group of German scientists, boldly embedded in *experimental physiology* were applying an empirical approach to describe how the senses worked. Helmholtz (1821–94), a German physicist, applied empirical methods to study the speed of nerve impulses, and to develop theories of hearing and vision. Weber (1795–1878), experimenting in threshold perception, established the first quantitative law of psychology with his work in just-perceivable differences. Fechner (1801–87), a German physiologist, philosopher, and psychologist, developed an interest in sensations while experimenting with light, resulting in the emergence of the field of psychophysics. Additionally, Fechner applied his philosophical ideas to relate the mental and physical worlds quantitatively. These applications of the experimental approach to the study of the mind merged with the prevailing disposition of empiricism to establish the foundations for the emerging philosophical position that was to dominate the next generation in psychology.

Structuralism

Continuing in the empirical physiological traditions firmly established in Germany, Wundt (1832–1920), considered the founder of modern psychology, established the first systematic school of thought in psychology later titled by Titchener, his

successor, as *structuralism*. Reflecting the zeitgeist in Europe, the rationalists additionally influenced structuralism, specifically the work of Galton (1822–1911), who held that man is born with all knowledge and through our senses, and these concepts are integrated and refined. Galton proceeded in the scientific spirit to investigate the genetics of intelligence and invent the first test to measure this realm. Galton believed that intelligence consisted of a general ability and several special abilities, thus expanding the earlier empiricist position to include innate attributes such as creativity of humans.

Wundt combined the rationalist, empiricist, and scientific spirit to advance the structuralist position that soon dominated the new emerging field of psychology. Believing in the creative synthesis of the mind, Wundt became deeply interested in the sensory process, propelling him toward a formal study of psychology. For the next 46 years, Wundt refined the structuralist position from his first established psychology laboratory in Leipzig. From there, Wundt became a prolific writer and teacher of the world's leading psychologists.

Experimental Psychology

Ebbinghaus (1850–1909), intrigued by the experimental advances of the structuralists, specifically explored the higher mental process of memory through a method utilizing nonsense syllables. By exploring the complexity of a task and cognitively relating it to assessing of higher mental processes, Ebbinghaus became one of the first psychologists to explore learning under experimental conditions.

Advancing the work of Wundt was his devout student Titchener (1867–1927) who translated the writings of Wundt into English, formally bringing structuralism to America. As head of the department of psychology at Cornell University, Titchener continued to follow in the footsteps of Wundt, invoking the principle of psychophysical parallelism, a form of dualism that suggested a parallelism between the mind and body, affecting one another though not interactive. Structuralism further advanced the concepts of sensory states, images, and affective states of consciousness. Titchener's work gave structuralism an American flavor different from its German roots. Unfortunately his unwillingness to remain open to new advances in psychology limited the structuralist point of view in North America and later led to its collapse as a formal school of thought. Propelling from the weaknesses imbedded in the propositions of structuralism was a new school of thought that reflected the zeitgeist of advancing times.

Functionalism

Emerging out of opposition to structuralism, a strongly pragmatic and practical form of new psychology known as *functionalism* dominated toward the end of the nineteenth century. Thriving in the more accepting climate of the North American scene, functionalism enjoyed a position of greater importance in America than it did in Europe. Opposing the structural claims of Wundt and Titchener who studied conscious contents, the functionalists emphasized mental acts or processes as the proper subject of study in psychology. Gaining momentum from the earlier work of Darwin (1809–82) whose theory of human evolution emphasized the importance of the mind in terms of its usefulness in adapting to the environment provided the material for functionalism. These works combined with the earlier mentioned research by Galton in mental inheritance, introduced to psychology the possibility of scientific methods applicable to both animal and humans and the use of techniques other than experimental introspection.

William James, considered by many as the greatest American psychologist, developed the first American theory of human learning – *functionalism*. This theory was in part based upon the work of Spencer (1820–1910), who held a utopian view of social Darwinism, which suggested that man and society without imposed order, would naturally evolve toward perfection. James (1842–1910), while an instructor in physiology at Harvard, established the first psychology laboratory in America where he advanced the work of functionalism with his theory of *stream of consciousness*. James advocated that mental process be studied as such and not as static pieces of consciousness. He further maintained that the purpose of consciousness must have some biological utility in order for its continued survival.

Continuing in the functional spirit, Hall (1844–1924) applied evolutionary theory particularly to the study of children, founding the child study movement in America. Cattell (1860–1944) augmented the practical aspect of functionalism in application to his work on reaction time and individual differences by initiating the mental test movement. Cattell became an ambassador of the functional school, promoting applied psychology throughout America. John Dewey (1859–1952) attacks the earlier philosophies of molecularism (analysis of small units) and reductionism (reduce elements to their smallest components) calling instead for a more functional psychology. Assuming leadership of the functional school during his appointment at the University of Chicago, Angell (1869–1949) formalized this philosophy into a formal school of psychology.

The work of the functionalists catalyzed much advancement in psychology through both direct and indirect influence due to its emphasis on a functional psychology versus one of structure. Improvement was seen in the area of research methodology, mental tests, and objective analysis of behavior. In addition, functionalism allowed for the study of children, the mentally retarded and the insane and introduced increasing research in animal psychology. Functionalism became the dominant school of thought in American psychology by the early 1900s and, though not formally dominant, remains an important orientation of contemporary American psychology. In the usual progression of history, the early 1900s saw a direct revolt against the dominant schools of structuralism and functionalism. The philosophy of the new challengers was later to become the dominant school of thought in American psychology.

Behaviorism

The progression of psychology toward applied experimental methodology, pragmatism, and emphasis on function combined with the acceptance of animal psychology and physiological influences set the scene for the behavioral revolution. Early work in conditioning by Russian physiologists provided much of the material for American behavioral

psychology. Sechenov (1829–1905), known as the father of Russian physiology, suggested that experimental approaches used in physiology should be applied to psychology. Further, Sechenov was also noted for his work in the role that reflexes and learning play in behavior. Bechterev (1857–1927) credited for developing reflexology, advanced the position that *external* behavior is the only valid consideration in scientific experimental inquiry. Following in these traditions, the Russian physiologist, Pavlov (1849–1936) showed that certain reflexes could be conditioned (Pavlov, 1927). Through his work in glandular secretions and motor movement, Pavlov initially included reference to mental states in his research with animals but in his later writings, excluded such references resulting in a purely objective stance. Most influential to American behaviorism was his research resulting in classical or Pavlovian conditioning, the process in which an initially neutral stimulus, called the *conditioned stimulus*, is repeatedly paired with a reinforcer or unconditioned stimulus, replacing the initial response, referred to as the unconditioned response with a conditioned response.

Applying these concepts in America, Watson (1878–1958) purposely intended to establish a new school of psychology in America, one that was to apply a purely objective and experimental approach to the study of behavior, both animal and human. Rejecting the teachings of the functionalist school, Watson suggested that the goal of psychology was to *predict* and *control* behavior, and he discarded all reference to consciousness. Watson was particularly influenced by the work of Thorndike (1874–1949), whose work advanced the development of animal psychology that culminated in his theories of trial and error learning. Reflecting on these advances, Watson applied the method of observation to comparative psychology in his work on fear responses using children and animals. Although pragmatic in practice, Watson's *objective* behaviorism was foundational to the work of neobehaviorists that further advanced behaviorism to its position of dominance in American psychology.

Neobehaviorism

Beginning in the 1930s and progressing into the 1960s was a second phase of behaviorism known as *neobehaviorism*. Proponents advocated explanatory systems and encouraged increased precision through common experimental methods and terminology. Applying postulates from both molercularism and Gestalt theory (which will be discussed further), Tolman (1866–1959) introduced the concept of *purposive* behaviorism that utilized a systematic treatment of the data in his research in learning and cognitive complexity based on studies done with animals in mazes. Employing a more theoretical than empirical approach, Guthrie (1886–1959) established *contiguous* conditioning based on an instrumental conditioning model that suggested that learning occurs through the pairing of a stimulus and a response, with reinforcement not necessary for learning to occur. Hull (1884–1952) applied concepts of mathematics to learning resulting in his *mathematico-deductive* theory of learning based on classical conditioning that emphasized habit strength and drive. Hull's theory was quite complex and usually stated in mathematical formulations. The most famous of the neo-behaviorists was Skinner (1904–90), developer of *operant* conditioning and its schedules of reinforcement. Skinner proposed that if the occurrence of an operant, or emitted response were followed by a reinforcing stimulus, the rate of responding would increase. Skinner's theory of operant conditioning has been of vital influence to the field of instructional development.

Gestalt

Parallel to behaviorism though independent from the American behaviorists, was a movement in Germany known as *Gestalt* psychology. Not unlike behaviorism, Gestalt emerged in opposition to both structuralism and functionalism, though in contrast to behaviorism, Gestalt psychology admitted the existence of consciousness and advocated the study of such as a whole entity rather than reducing it to elemental analysis. Based on the work of Kant (1724–1804), the Gestalt position focused on unity of perception and insight in learning. The founder of the school of Gestalt psychology, Wertheimer, together with his students Köffka (1886–1941) and Köhler (1887–1967), engaged in a direct crusade against Wundtian elementalism. Wertheimer's work in perceptual organization suggested that objects are perceived in the same unified manner as motion is perceived and that these perceptions are organized by a series of rules.

With the rise of anti-intellectual sentiment invoked by the rise to power of the Nazi political party, the leaders of Gestalt psychology fled from Germany reducing the movement to one of limited significance. As Gestalt psychologists migrated to the United States, they experienced some difficulty gaining popularity due to the strong behavioral sentiment dominating American psychology by the mid-1930s, particularly in light of the inherent language barrier. Strongly imbedded in behavioral tradition, American psychologists criticized Gestalt psychologists as employing poor experimental procedures with inadequate control of variables and weakly supported assumptions. Regardless, American psychologist Lewin (1890–1947) attempted to add a psychology of motivation to the existing Gestalt philosophy resulting in his *field* theory, a system that adds both motivation and social factors to the principles of Gestalt psychology.

Psychoanalysis

Although it did not strive to become a form of pure science, as did the other philosophical positions previously discussed, psychoanalysis emerged at the turn of the century as a theory applied to clinical psychotherapy. Psychoanalysis, founded by Freud (1856–1939), deviated from the other psychological schools in method, goals, and subject. Regardless of this lack of connection with the other schools of thought, psychoanalysis is mentioned here due to its profound influence on modern psychology. Psychoanalysis studied individuals in clinical observation, speculating on the unconscious, and applying these results to disturbed individuals in individual therapy. The obvious criticisms of psychoanalysis by the dominant schools of psychology were in its unscientific and nonempirical methods of data collection and inability to quantify its data.

Humanism

Emerging in opposition to psychoanalysis and behaviorism, the humanistic movement is titled the third force in modern American psychology. Growing out of the work of Maslow (1908–70), a personality theorist, and Rogers (1902–86), a psychotherapist, humanism attempts to draw psychology back to inclusion of human processes by advocating subjective experience, freedom of choice, individual uniqueness, and striving toward individual human potential within the broader frame of society. As it influences contemporary psychology, the humanistic movement has been particularly influential in the field of psychotherapy.

Constructivism

Constructivism is a philosophical branch of psychology that maintains that what an individual learns and understands is constructed by the individual. Educational constructivists differ in the degree to which they ascribe knowledge construction to the student. On one hand, certain constructivists view mental models as reflective of external realities, whereas, on the other hand, some constructivists see no independent reality external to the mental model of the individual. Furthermore, constructivist philosophy emphasizes the role of social interactions (e.g., student to student, teacher to student, and student to media) as influencing what students' learn. For educational purposes, most constructivists agree on the following attributes for a learning environment: (1) that students are active in constructing their own knowledge and (2) that social interactions are important to knowledge construction.

Cognitive Psychology

The final school of philosophical thought influencing the field of educational paradigms is cognitive psychology, the scientific study of mental events. Emerging as an empirical science in the late nineteenth century, many of the psychologists mentioned of the late 1800s were actually cognitive psychologists as they focused on mental events, including Wundt and James. Experiencing limited popularity during the domination of behaviorism, cognitive psychology was spurred on by the outbreak of World War II that employed the expertise of psychologists in the selection and training of military personnel. Successful at influencing such complex cognitive tasks, a group of psychologists became interested in mental structures and processes initiating the rebirth of cognitive psychology.

Facilitating the further growth of cognitive psychology were the areas of information science and specific studies in linguistics, both of which attempted to study mental structures and knowledge representation. Perhaps the most influential event in the advancement of cognitive psychology was the computer, which provided for objective measure of these processes. Cognitive psychology specifically addresses the importance of knowing, understanding, reasoning, remembering, and perception. We will further elaborate on cognitive psychology in the next section on learning theory.

Learning Theory

In this section we present an overview of learning theories that form the core knowledge for this competency area in educational foundations. The reader is encouraged to seek out additional literature in learning theories to further elaborate their individual core knowledge. The information presented in this section should arm the novice with enough core knowledge to make an initial statement regarding their personal learning theory.

Behavioral Psychology

Companioned with Freud's psychoanalytic theory and Maslow's humanistic approach, behaviorism has been titled the third dominant force to shape modern psychology. Although behaviorism is comprised of several heterogeneous subgroups, Skinner's radical behaviorism has endured the longest period of time, surviving for more than half a century. Furthermore, Skinner's work is seen as being the most important contribution to psychology during the post-World War II period. Despite its stature within American psychology, the past few decades have been witnessed a growing dissatisfaction with radical behaviorism while interest in psychological theories that acknowledge mediational processes, such as cognitive psychology, have been on the rise. However, behavioral theory offers much to the understanding of human learning and the means by which instruction can be designed.

Basic Assumptions of Behaviorism

The importance of behavioral theory is the fine toning of its basic underlining principles. For the most part, these assumptions have a rich tradition in the quantitative nature of behaviorism. The foremost assumption is that principles of learning apply equally to different behaviors and to different species of animals. This is a fundamental premise of the basic behavioral research paradigm. That is, it is entirely possible to study behavior in animals and generalize the findings to humans. A second assumption is that behavior can be studied most objectively when the focus of study is on stimuli and responses. A result of this assumption is that internal cognition is excluded from scientific study. All organisms, including humans are born with no inherited knowledge or experiences. Everything is learned. Learning is a change in behavior resulting from environmental events. Thus, learning can be described as *conditioning* resulting from a relationship between stimuli and responses. Finally, the most useful theories of learning tend to be parsimonious in content.

Background

Behaviorism developed at the start of the twentieth century as a reaction to the functional paradigm. Functionalism was America's first contribution to a theory of learning and represented an application of Darwin's theory of evolution to animal behavior. Based on that theory, functionalism explained that behavior was a result of the animal adapting to environmental variables and conditions. From this perspective, functionalism tried to explain observable behavior by studying

mentally derived rationales. This methodology used introspection as the means for discovering internal mental causes of behavior. Two early leaders in the behavioral revolution were Edward Thorndike and John Watson.

Edward Thorndike

The father of educational psychology is often bestowed upon Edward Thorndike because of his desire to bridge the gap between his laboratory research and findings and application into the classroom. Thorndike's theory of learning meets a behavioral tenet that theories be parsimonious. His classroom instructional strategies were contained within two laws of learning. The first, *law of effect*, states that responses to a situation that are followed by satisfaction are strengthened; responses that are followed by discomfort are weakened. This law set the tone for the behavioral paradigm that positive reinforcers are more effective than negative. Correct behaviors were rewarding while incorrect behaviors failed to elicit positive responses. In other words, punishment was not considered a useful means for learning. The second, *law of exercise*, states that stimulus–response connections that are repeated are strengthened; stimulus–response connections that are not used are weakened. Thorndike based an important part of classroom learning on the concept of drill and practice. Worksheets are still an integral component of classroom learning.

John Watson

While a student at the University of Chicago, John Watson, the founder of behavioral psychology, became dissatisfied with this dual methodology that considered both overt and introspective activity, particularly criticizing the failure of researchers to agree on data obtained through supposed observations of the conscious (mental) states of animals. Instead he proposed that psychology restrict itself only to the study of overt behavior, examining observable activities. His presidential address at the American Psychological Association in 1913 is often used as the formal start of behavioral psychology. In keeping with the parsimonious nature of behavioral theory, Watson proposed from his research studies two laws of learning. The first, *law of frequency*, states that the more frequently a stimulus and response occur in association with each other, the stronger that S–R condition would become. The second, *law of recency*, states that a response that has most recently occurred after a particular stimulus is the response most likely to be associated with that stimulus. In contrast to Thorndike's laws that were aimed for the classroom, Watson moved his laws into the realm of advertising. This came about because of his having to leave the academic community for New York City in the early 1920s. He was quite successful in applying his laws to the relatively new field of advertising.

Respondent Conditioning

What followed the work of Thorndike and Watson was a field of psychology acknowledging two basic forms for studying animal behavior. The first, *respondent conditioning* (also labeled as Type S – emphasis on the stimulus), is represented by observing how animals can be conditioned to behave by controlling the association between a stimulus and response (Pavlov, 1927). **Table 1** illustrates a situation in which a desired association is developed by introducing a *conditioned stimulus* (CS, a unique sound) with an existing association (in this case between giving food to an animal and the salivation process). This paradigm assumes that the CS will replace an *unconditional stimulus* (UCS, food pellet) because of the close proximity to the *unconditioned response* (UCR, salivation). The example shows that eventually when the CS is introduced, the response will follow paired, in turn, with the UCS. In time, the UCS is removed totally, and the association is between the CS and the *conditioned response* (CR). This form of behaviorism is still a major research area in contemporary psychology.

Table 1 Respondent conditioning procedure

Stage	*Stimulus*	*Response*
1	UCS (food pellet)	UCR (salivation)
2	CS (unique sound), the UCS (food pellet)	UCR (salivation)
3	CS (unique sound)	CR (salivation)

Operant Conditioning

The second behavioral format of animal study was Skinner's extension of Thorndike's law of effect: *operant* (or instrumental) *conditioning*. Although Skinner acknowledged the existence of cognitions, he did not consider them germane to understanding human behavior. In fact, Skinner believed that learning occurred in similar ways for both humans and infrahumans, that is, through operant conditioning (Skinner, 1938). In its simplest form, operant conditioning has been expressed as an *S–R* model where the *S* represents the operant or behavior that is emitted by the organism; the *R* represents the response. The operant response has the following characteristics: it must be spontaneous, meaning that it is already in the organism's response repertoire; it must be autonomous; it must be measurable; and, it must occur in a consistent predictable manner under the influence of a particular controlling variable.

In contrast to Type S conditioning, operant or Type R conditioning emphasizes the response aspect. Skinner explained Type R conditioning and extinction as follows:

> If the occurrence of an operant is followed by presentation of a reinforcing stimulus, the strength is increased . . . . If the occurrence of an operant already strengthened through conditioning is not followed by reinforcing stimulus, the strength is decreased.
>
> Skinner, 1938: p.21

There is also an optional antecedent stimulus event frequently called the discriminative stimulus (S^D) that precedes the operant response and sets the occasion for responding. The discriminative stimulus is a specific physical stimulus in whose presence the operant behavior is reinforced (R^R) (**Figure 1**). Learning occurs when these behaviors become strengthened by a reinforcing stimulus. Simple behaviors can be chained to form more complex behaviors. The reinforcing stimulus has

$$S^D \rightarrow R \rightarrow R^R$$

Figure 1 Basic operant model of conditioning.

several characteristics that have differential effects on operant responding, including amount, quantity, magnitude, or size of stimulus; immediacy of delivery; and schedule of reinforcement administered, namely fixed, variable, ratio, or interval. For example, if reinforcement was provided for some desired behavior when a light was turned on but was not given when the light was off, the subject would eventually learn to emit the desired behavior only when the light was on. The light, when turned on, would have become a discriminative stimulus indicating that reinforcement was forthcoming if the desired behavior was emitted in its presence.

Operant responding can be strengthened or increased via positive and negative reinforcement. In positive reinforcement, a valued stimulus is presented after a response that, in turn, increases the probability that the behavior will reoccur. In negative reinforcement, an adverse stimulus is removed after a response that also increases the probability that the behavior will reoccur. Operant responding is weakened through two types of punishment (positive and negative). In positive punishment, a negatively valued stimulus is presented after a response that, in turn, decreases the probability that the behavior will return. In negative punishment (omission), a valued stimulus is removed after a response, which, like positive punishment, will decrease the probability of reoccurrence of behavior.

Edwin Guthrie

In contrast to the concept of reinforcement, especially as applied in the form of rewards, as the means to improve the probability of learning taking place, is the single occurrence law of Edwin Guthrie. Simply, Guthrie maintained that a stimulus that is followed by a particular response would, upon its recurrence tend to be followed by the same response again. This S–R connection gains its full strength on one trial. As such, Guthrie totally rejected the role of reward in learning. Guthrie, a contemporary of Skinner, did not popularize his theory in the practice of education because of the intuitive nature of humans to accept the concept of rewards as a *why* for learning.

Modern Trends in Behavioral Theory

In the 1980s, behaviorism continued to survive more in application than it did in theory development. Although cognitive psychology had become the dominant theoretical force in psychology in the 1980s, behavioral approaches could be found in settings such as clinical psychology, special education, industry, and the military. However, even in these bastions of behaviorism there was some evidence that, at least theoretically, behaviorists were beginning to acknowledge the potential importance of mediational influences on behavior.

Contemporary behavioral theory maintains a strong emphasis on behavior. These include the concepts of *active* respondents (e.g., talking, writing, experimenting and demonstrating) and *assessment* of learning (e.g., actual observation of students' behaviors changing as a result of instruction (e.g., higher test scores, improved performance, more appropriate social interaction skills, or better study habits)). Drill and practice, repetition of stimulus–response interactions, continues in education – especially in adult literacy, where the instructional strategy is read, read, read! Likewise, there are updates in Guthrie's theory for breaking habits (make a new response to the same old stimulus). Three useful methods are as follows:

- Exhaustion method. Continue an S–R activity until the individual is too tired to continue.
- Threshold method. Start a stimulus task below the intensity level. Gradually increase intensity so that the individual still does not respond. For example, in test anxiety present less demanding items that are actually enjoyable. In other words, move the instruction from easy to hard.
- Incompatible stimulus method. Present stimulus when the response cannot occur.

For example, in cooperative learning, substitute cooperation for competition. Rewards (reinforcement) for desirable behavior, timing, magnitude, and consistency of reinforcement, are still viewed to affect the rate at which new behaviors are learned.

However, not all behaviorists became more liberal in the 1990s. In his article, *The Shame of American Education*, Skinner (1984) lamented that the technology for effective teaching was currently available but was not being used. He viewed the trend toward cognitive psychology as being in the wrong direction. Indeed, he stated that cognitive psychology was not a revolt against behaviorism but rather a retreat. Skinner criticized cognitive psychology in that the promises to significantly improve education made a quarter of a century ago had not come to pass. He also contended that in the area of teaching language, linguists and supporters of cognitive science had not produced anything as effective as programmed instruction. Cognitive psychology had gained credibility due to its connections with brain research. However, Skinner noted that cognitive psychologists were a long way from developing useful instructional practices based on such research.

Cognitive Psychology

Behavioral psychology in its various forms holds to two primary principles of learning. The first principle is the roles of environmental conditions (stimuli) in establishing a framework from which learning is initiated. The second is the occurrence of observable behaviors (responses) resulting from the environment. Developing concurrently with behavioral theories were two alternatives to the why and how of learning: social learning theory and cognitivism. The concern of cognitive theories with knowledge structures, metacognitive strategies for problem solving, and integration of new and existing knowledge structures by the learner is leading to a number of educational paradigm changes. These changes include: development of new theoretical bases for design of learning environments intended to facilitate exploration and reinforce context; expansion of the role of learner control in instructional management; enriched dialog between the learner and the learning environment to support individual learner differences

to facilitate social integration and enhance motivation; and a redefinition of the structural requirements for simulations and games.

Background: Social Learning Theory

Social learning theory found earlier proponents for application in the classroom than did cognitive theory because of the focus in the social theories on ways in which students learn from interacting with one another. The main concept in social learning theory is that learning occurrences by individuals observing others, especially one's peers. Additionally, social theory blends behavioral concepts of reinforcement and punishment with cognitive concepts of awareness and expectations. A reciprocal causation between environmental conditions and cognitive variables explain the how of learning from this perspective.

The work of Albert Bandura (1969, 1986) spans much of the rich literature in social learning theory. Bandura's model of social learning theory revolves around the individual having the opportunity to model a best example of a desired behavior. Four variables within the modeling paradigm are necessary for learning to occur. These four are attention, retention, motor reproduction, and motivation. Attention actives the individual's focus on the presentation of the behavior to be learned. This variable establishes the role of the environment as the primary source of information to be learned. Retention, on the other hand, evokes a cognitive condition in which the individual recalls the desired behavior. For learning to have a lengthy duration, retention must occur. The reciprocal causation to retention is the behavioral variable of performing an observable behavior (or motor reproduction). This third variable requires the individual to assume the necessary role conditions of the desired behavior. Simply imaging a behavior in a mental model is insufficient for learning. Finally, learning a behavior is largely dependent on the effort or motivation that the individual puts into the task. Motivation in this model is the responsibility of the individual.

The reciprocal relationship between cognitive variables and environmental conditions is the within the affective domain. For example, self-efficacy, defined as a situational attitude, reflects on the person's belief toward possible task success. High self-efficacy would imply that a person feels that they can achieve success in a given situation. On the other hand, low self-efficacy would necessarily inhibit a goal of success. Another affective domain variable that strongly shows the cognitive role in learning is the concept of self-regulation. This variable is central to the cognitive theories of constructivism. For self-regulation to develop, the individual needs to establish personal criteria by which to make decisions and choices. Other affective/cognitive variables in social learning theory are self-observation and judging, self-monitoring, and self-imposed stimulus control.

Background: Cognitive Theory

In an outline of cognitive psychology history, Tennyson and Elmore (1997) write that cognitive psychology grew out of a history of behaviorism (e.g., Skinner) and psychoanalysis (e.g., Freud). These two divergent approaches focused on the individual; additionally, the measurement tools developed in cognitive psychology have also been focused on the learner. To the extent that educators understand the learner, they can develop more effective instruction, but cognitive psychology has not been primarily concerned with that. Effective instruction is an implementation of research. That is, experimental psychologists conducting basic research in human learning have not traditionally been responsible for diffusion and dissemination of their findings into the various fields of education.

Cognitive psychology separated from the behavioral tradition because of the dissatisfaction in the 1960s with the 'thoughtless' approach to human learning offered by behaviorism (Neisser, 1967). The focus of cognitive psychology theory development and research was on the processes of how people perceive, interpret, remember, and otherwise think about the environmental events they experience. These newer developments actually extended work begun several decades earlier. For example, Edward Tolman (1932) viewed learning as occurring within a context (molar level) and without reinforcement. And, even earlier, Gestalt psychologist wrote about the importance of organizational processes in perception (the whole is more than the sum of its parts), in learning (law of Prägnanz – simple explanations), and problem solving (restructuring and insight).

Jean Piaget's developmental theory (1928) became increasingly popular in schooling environments during the 1970s and still forms much of the foundational theory for cognitive theory, especially in the area constructivism. Briefly, Piaget held that learners are active processors of information and the resulting knowledge in memory can be described in terms of structures that change with development (scheme). Furthermore, cognitive development occurs with interaction between physical and social environments.

In Piagetian terms, there is two cognitive processes people use to interact: assimilation and accommodation. Assimilation accounts for the acquisition of new knowledge while accommodation is mental process of accepting new knowledge with the old. This latter process attempts to establish an equilibration between new (equilibrium) and accepting of new with the old (disequilibrium). All of this mental functioning occurs over four stages of human development. An important component of Piaget's theory is the philosophy that people are intrinsically motivated.

One final early learning theorist whose effect on contemporary cognitive theory occurred decades after his death is the Russian psychologist, Lev Vygotsky's. Most of Vygotsky's research in developmental cognition was done in the 1920s, with his interest in the concept that mental processes begin as social activities and later, as they become internalized, can be transferred and generalized to other situations and activities. Of much interest to adult educators is Vygotsky's theory that learning is more efficient if done while interacting with more competent persons. This can be accomplished if the teacher, for example, can assess both the learner's actual developmental level and his/her level of potential development. The gap between these two levels is labeled the zone of proximal development. A recent

translation (Vygotsky, 1997) offers a good look at this important theory of learning.

Information Processing Models

A primary application of computer techniques in describing learning was the development of information processing (IP) models (Simon and Newell, 1964). The basic components of the IP model of learning (**Figure 2**) include the following components: sensory receptors, perception, short-term (working) memory, and long-term memory. Contemporary IP models, unlike the behavioral models, have two primary sources of knowledge acquisition: external and internal. External information enters the cognitive system through the standard sensory mechanisms while internal information is constructed as a result of the output–input relationship between the three system components. External behavior is exhibited through the output of the sensory receptor component.

Sensory Receptors Component

External information enters and behavior exits the cognitive system through the sensory receptors. Basically, these sensory receptors are the learner's ears and mouth (auditory) and eyes (visual). The information in this register decays rapidly and is easily interrupted. External stimuli include those aspects of instructional development referred to as delivery systems; such as, text materials, visuals, audio sources, graphics, illustrations, drawings, etc.

Perception Component

Information coming from the external receptors or from internal knowledge sources passes through the perception component which performs the function of being aware of and evaluating the potential value and worth of that information and knowledge, respectively. The perception component can be viewed as a filtering device for the cognitive system. Overtime, the perception component performs this filtering task in an autonomous or subconscious matter; all within a short time period, 0.5–2.0 s. For example, when a person enters a new course for the first time, they may view the course as too easy, thus putting in a minimum amount of effort or they many view the course as too difficult, again, putting in minimum effort. The learner is evaluating the situation in the perception component prior to actual cognitive activity. Perception is often a precognition mental operation.

Short-Term (Working) Memory Component

There is considerable debate as to the divisions or architecture of memory, but in a broad sense, the exact details are not important to the instructional implications of the various theories. In general, there is agreement that memory comes in two forms, a store for previously learned information and a store for information that is currently being processed. This latter form, short-term (working) memory, is defined with these salient aspects: (1) it is limited in storage capacity and time (approximately 20 s); (2) items in working memory are subject to manipulations such as rehearsal, comparison, or matching and reordering by the processes that operate in short-term memory; and (3) items are selected for inclusion in short-term memory either by some consciously active process or by automatic action of well developed processes in such activities as reading, processing of verbal discourse, imagery evoking processes, etc.

Long-Term Memory Component

The acquisition of knowledge and the means to employ and elaborate knowledge occur within the storage and retrieval subsystems of the long-term memory component. Within the storage subsystem information is encoded into the knowledge base according to various representations (i.e., declarative and procedural knowledge), while the retrieval subsystem uses cognitive abilities to employ knowledge (i.e., differentiation and integration).

The storage subsystem is where coded knowledge is assimilated into a learner's existing knowledge base. A knowledge base can be described as an associative network of concepts (or schemas) that varies per individual according to amount, organization, and accessibility of its knowledge. Amount refers to the actual volume of knowledge coded in memory, while organization implies the structural connections and associations of that knowledge, and accessibility referring to the processes used in servicing the knowledge base. The latter two forms of knowledge are those that separate an expert from a novice. That is, a large amount of knowledge is not the key to expert performance, but rather the ability to both find and employ knowledge appropriately.

Within long-term memory there are two types of knowledge: declarative and procedural. Declarative knowledge implies an awareness of knowledge and refers to the *knowing that*, for example, the student understands that underlining keywords in a text will help recall. Procedural knowledge implies a *knowing how* to use given facts, concepts, rules, and principles. For example, the student knows how to perform an analysis of variance in a statistical test.

The values of declarative and procedural knowledge are their employment in the service of recall, recognition, and problem solving. Cognitive abilities in the storage subsystem can be distinguished as either domain-dependent (cognitive

Figure 2 Illustration of a generic information processing model.

skill) or domain-independent (cognitive strategy). In the cognitive literature, skill is often referred to as a specific application of a strategy within a given situation whereas strategy has come to imply a generic ability that can be applied across domains. Both skills and strategies include two primary cognitive operations: differentiation and integration (Schröder, 1971). Differentiation is defined as the twofold mental activity to understand a given situation and to apply appropriate contextual criteria (i.e., the standards, situational appropriateness, and/or values) by which to selectively retrieve specific knowledge from storage. Integration is the ability to elaborate or restructure existing knowledge in the service of previously unencountered problem situations.

A number of learning theories dealing with a cognitive approach to learning have been developed over the last several decades. We will review five of these theories in this article: schema theory, advance organizers, assimilation theory, discovery learning, and creativity.

Schema Theory

Cognitive theorists, departing from the past focus on behaviorism, have emphasized the importance of schemata in learning new information. A schema can be defined as representing a structural framework into which new knowledge is instantiated. While there is not one *schema theory*, there is a wide range of cognitive theories which include the concept of schemata and which emphasize cognitive structure.

Early Schema Theory

Bartlett (1932) was one of the first psychologists to use the term *schema* in relationship to learning theory. His general theory was that remembering is schematically determined. He postulated that, "Circumstances that arouse memory orientations set up an attitude that is primarily toward a particular schematic organization" (p. 24). He theorized that the construction or reconstruction of recalled knowledge is always within this organization. Bartlett's definition of schemata involved a general perception of life; thus, a schema governs a person's perception of new or recalled information. Bartlett contended that schemata influence memory by interacting with incoming stimulus content in an effort to make the content meaningful. The schemata strongly influence the perception of the information and this, in turn, determines what is retained.

Cognitive View

Ausubel (1980), representing a more contemporary cognitive view and in contrast with Bartlett's definition of schema which is more attitudinal and affective, maintains that this interpretive process is not perceptual but cognitive. Additionally, in Ausubel's view, the emphasis should not be on remembering, for many of the effects of schemata are present in the initial assimilation of the information. Accordingly, the existing cognitive structure at the time of learning is, perhaps, the most important factor influencing the learning process. If the cognitive structure is clear and well organized, clear concepts can be formed and meaningful learning can take place. If, however, a given cognitive structure is disorganized and ambiguous, retention is limited and meaningful learning is unlikely. The ease and speed of learning is, therefore, dependent upon the ease with which new information can be placed into an existing schema. Thus, the single most important aspect in facilitating learning is strengthening the relevant cognitive structure. Ausubel further describes schemata as providing *ideational scaffolding*, containing slots that can be instantiated with particular cases. Cognitive information, such as declarative and procedural knowledge, must be used to instantiate these slots.

Contemporary View

Current learning theories view schemata as cognitive structures that serve to organize information into meaningful concepts. Developed cognitive structures aid in learning because new information can be incorporated more readily and the association with established concepts extends the structure to the new information. The number of schemata present is also significant, because overlapping structures (structures containing common information *slots*) provide additional opportunities to use information and can aid in recall by strengthening semantic networks. For example, without a schema, learning is slow and uncertain. While this is rare, a more common situation is the contrast between a well-constructed schema and a poorly constructed one. In a disorganized schema, the slots in the framework can remain empty, or information can be distorted before being instantiated, if a fit is otherwise difficult. In other words, schemata provide a structural framework, like the steel frame for a building provides a framework, for the walls, floors, and windows that follow. This framework must form a *cognitive bridge* between what the student already knows and the new information. The absence of such a conceptual framework may contribute to the rapid loss of information shortly after a test is taken and may also account for frequent trial-and-error approaches.

Whenever someone has learned something, a schema has been produced. The knowledge structures acquired even for simple tasks can be quite involved. Additionally, it is important to characterize the schematic knowledge available to students. Since events recalled are influenced by the currently activated schemata, it is necessary to have some idea of the current schemata and to modify it, if necessary, to aid in the retention of appropriate material. For example, in a story about a restaurant, it is necessary to have some knowledge about restaurants in general, to be able to infer the information necessary to make sense out of the story. This general knowledge is a schema, and without this context the material is not likely to take on any meaning, even after numerous repetitions.

Learning often involves making inferences from incomplete information. When presented with new information, people make a constructive hypothesis, which is often remembered better than the information, and includes many inferences, based on what they hear. Remembering is often based on a reconstructive hypothesis which involves reconstructing the details from a general idea of what was presented, somewhat like problem solving; that is, determining what is likely to have happened based on the information or general idea remembered. If the information is consistent with the context and expectations recall will be accurate; if however, it is not, either recall will be low or reconstruction

will be erroneous, based on a context not consistent with the actual details. This leads to the assumption that a suitable context (schema) is necessary for understanding and reconstructing new information and those students with more contextual information will be better at assimilating new information.

Advance Organizers

An important concept in cognitive learning theories is the use of advance organizers. Closely associated with schema theory, advance organizers help to establish a relevant cognitive structure to aid in meaningful learning. Both quantitative and qualitative effects of repetition in learning accomplish this. Repetition influences the quantity learned because with each repetition, more information is added to memory. Repetition increases the quality of learning because the student is able to build a conceptual framework, using an *assimilative encoding strategy* to build conceptual relationships and reorganize information into a whole. In this sense, advance organizers perform a function similar to repetition, improving problem solving and overall learning (qualitative) but not the learning of verbatim information (quantitative). This is consistent with general schema theory where advance organizers aid in the formation of a conceptual framework, reducing the need for repetition.

Assimilation Theory

In presenting cognitive theory, recall that much of the behaviorist research, leading to a stimulus–response (S–R) theory of learning, was done on animals, who do not form concepts, and in human rote learning. Since concept learning is an important part of human learning, behaviorally based research is not sufficient in describing human learning.

In cognitive learning theory, there is a continuum from rote learning to meaningful learning. In rote learning, new information is placed in cognitive structure in an arbitrary manner. In meaningful learning, new information is linked to relevant, existing concepts in cognitive structures (or mental models). The structural core is the interaction of this new knowledge with the preexisting knowledge, often modifying both the new and preexisting information. With meaningful learning, old and new information is assimilated and formed into a more structured cognitive organization.

Assimilation encoding theory is a three-stage model that involves actively integrating new information with existing knowledge and measuring results in terms of breadth rather than amount retained. The three stages are: receipt of information from the outside world; availability of relevant anchoring knowledge in long-term memory; and, transfer of anchoring knowledge from long-term memory to working memory and active integration of that knowledge with incoming information during learning.

This theory predicts that advance organizers, given before learning, can facilitate the availability of anchoring knowledge and the integration of this existing knowledge with incoming information. There are several reasons, according to Assimilation Encoding Theory, why advance organizers may succeed or fail to influence learning. If the material to be learned lacks an overall structure, then an effective advance organizer cannot be constructed. If the advance organizer does not provide an adequate assimilative context, then integration of new and existing information may not occur. If the learner already possesses relevant experience and knowledge or a well-developed cognitive structure (schema), the use of advance organizers may have no benefit.

Discovery Learning

In the early 1970s Egan and Greeno (1973) tested the effectiveness of discovery learning with learning by rule. The group using the discovery method showed a wider discrepancy in performance than students using the rule method. This was because several cognitive skills necessary for learning by discovery were found to be less essential to learning by rule. The findings also indicated that discovery leads to the structural integration of previously known concepts, while the outcome of learning by rule is the addition of new structures. High ability students performed about as well using either method, while low ability students learned more effectively by rule, because they lacked the cognitive structures (schemata) necessary to form new structures.

Creativity

In the educational community there has been a strong focus on the need to improve creativity. Making people better thinkers and problem solvers has been emphasized as an educational goal since John Dewey's (1932) writings on progressive education. These themes continue to appear as national concerns due to the dissatisfaction of educators with current curricular goals and instructional methods used in the schools and in training.

Creativity is defined as having the three attributes of novelty and value: The first is personal (i.e., the individual recognizes the uniqueness of the created knowledge); the second is peer group (i.e., recognition by experts within a given domain); and, the third is societal (i.e., recognition by the general members of the given community).

The work of Torrance and his associates (e.g., Torrance and Ball, 1984) has developed instruments to measure creativity through the number of ideas developed for specific situations and tasks. This implies that creativity is the internal creation of knowledge not previously part of the individual's knowledge base. Another feature of measuring creativity is the inclusion of the individual's ability to establish a criterion for ideas created. That is, not only is the individual creating ideas, but they are also defining the means by which their ideas can be judged. For example, in preparing for an experiment in a physics class, the student needs to define the possible value that results might provide not just the fact that they put some elements together.

Tennyson and Breuer (1997) explain creativity using cognitive complexity theory of differentiation and integration. To these authors, creativity is the concurrent employment of cognitive complexity with the process of internal acquisition of knowledge, thus a twofold cognitive ability: (1) creating knowledge in order to solve a given problem

proposed from the external environment and (2) creating a problem and then the necessary knowledge to propose a solution(s). Integral to the creation of the problem and knowledge is the creation of the criteria that can then be used to determine the possible effectiveness of the solution proposal. Criterion is defined as the perceived value or worth employed by the student in the creating process. That is, one must also consider creating the criteria concurrently with creating the problem and/or knowledge that is consistently employed with a high level of reliability and productivity.

Summary

In conclusion, we would like to summarize the main components and ideas of cognitive theory. This summary can be compared with the summary on behaviorism to contrast similarities and differences between these two main bodies of learning theories.

- Some learning processes may be unique to human beings.
- Cognitive processes are the focus of research and study.
- Objective, systematic observations of people's behavior should be the focus of scientific inquiry; however, inferences about unobservable cognitive processes can and should be drawn from such behavior.
- Individuals are actively involved in the learning process. Learners control their own learning.
- Learning involves the formation of cognitive associations that are not necessarily reflected in overt behavior changes.
- Knowledge is organized (knowledge, beliefs, attitudes, and emotions are associated and interconnected).
- Learning is a process of relating new information to previously learned information.

The distinction between learning philosophy and learning theory is often confusing if viewed from an abstract position. However, by understanding a learning philosophy, the task of employing learning theory becomes much clearer. Therefore, we suggest that the reader prepare a working statement on their personal learning philosophy prior to selecting and employing learning theory. In this process, the learning philosophy statement can be reviewed and refined if necessary to balance the validity between the two areas.

Abstract

Research has shown that learners can intentionally improve how effectively and efficiently they construct knowledge and develop skills. Teaching students how to learn is critical to helping them learn and use content knowledge in any subject area. It can also help students develop more effective and efficient learning routines and adapt and transfer their learning processes to new contexts. In this article, we overview the progression of research on learning to learn, summarize the Model of Strategic Learning, and describe learning to learn assessments and interventions that can be used to help students become more strategic and self-regulated learners.

Learning to Learn

Learning to learn involves a complex and dynamic interaction of cognitive, metacognitive, motivational, affective, and behavioral processes selected to enhance the probability of reaching a goal for knowledge acquisition or application. The quest for understanding and harnessing an individual's ability to identify, reflect upon, improve, and control his or her learning processes and outcomes began in ancient times with the study of mnemonics (memory aids) and Socratic teaching methods. However, it is only since approximately 1975 that incredible progress in understanding learning to learn and the methods that can be used to improve it has occurred (Weinstein and Acee, 2013; Weinstein et al., 2011). This article will present a definition of learning to learn followed by a brief history of the development of the study of learning to learn processes. A model summarizing much of the current research in this area will then be presented as well as a summary of the results of current research examining the nature and effectiveness of methods for improving learning abilities and skills. The article concludes with a discussion of suggestions for future research and conceptual development in the area of learning to learn.

Learning to Learn Strategies

Learning to learn strategies include any thoughts, behaviors, beliefs, or emotions that facilitate the acquisition, understanding, or later application and transfer of new knowledge and skills in different performance contexts. They range from active rehearsal to help remember word lists, to the use of elaboration and organization to encode, integrate, and later recall or apply knowledge across several content areas (Weinstein and Mayer, 1986). Learning to learn strategies help generate meaning for the new information that is to be learned. Repeating the names of the planets in order, organizing the discoveries of the great explorers by creating timelines and mind maps, comparing and contrasting the causes of World War I and World War II are all examples of learning strategies. They all are designed to help the learner generate meaning and store the new information in memory in a manner that will facilitate integration with related knowledge and increase the probability of later recall and use, particularly in transfer contexts.

A learning strategy is also a plan for orchestrating cognitive and motivational resources to help reach a learning goal (Weinstein and Acee, 2013; Weinstein et al., 2011). Learning to learn strategies have several characteristics in common. First, they are goal directed. Learning strategies are used to help meet a standard of performance or to reach a learning goal. Second, learning strategies are intentionally invoked, which implies at least some level of active selection. The selection of one or more of these strategies is determined by a number of factors, such as a student's prior experience with the strategy, his or her prior experience with similar learning tasks, his or her ability to deal with distractions, and the student's commitment to his or her goals. Third, cognitive learning strategies are effortful; they require time and often involve using multiple, highly interactive steps. Because of the effort required, a student must be motivated to initiate and maintain strategy use (e.g., *see* Motivation, Learning, and Instruction). In addition, the student must believe that the strategy will be effective and that he or she can be successful using the strategy. Finally, cognitive learning strategies are not universally applicable – they are situation specific to a greater or lesser degree (Weinstein and Acee, 2013; Weinstein et al., 2011). In general, learning strategies have differing domains of applicability and usefulness. For example, time management strategies can be applied in a wide variety of contexts ranging from reading a chapter in a physics textbook to planning a study schedule for the week before an exam. Other strategies are more limited in their generalizability such as using an information processing strategy for solving algebraic equations with one unknown variable. In addition, the student's goals, the task requirements, the context, and other factors all interact to help determine which strategy may be best. To be successful in selecting and using a strategy, a student must understand under what circumstances a given strategy is or is not appropriate. The following section will discuss the evolution of learning to learn as a field of study and a source of

applications for many students experiencing difficulty in an educational setting.

Historical Overview

In ancient times the great Greek orators were known for giving long speeches that sometimes lasted more than 2 or 3 h. They managed this task through the use of mnemonic or memory devices that helped them to remember both the ideas and the order of the ideas for their presentations. The most famous of these techniques is the Method of Loci. Basically, using the Method of Loci involves remembering a series of locations in order. This could be the buildings and landmarks the orator passed on the way to the arena or the rooms in a large villa. As the ideas were generated for the speech, the orator would 'store' an image of the idea at a specific location. When the time came to give the speech, the ideas would be recalled as the speaker 'went' from location to location.

For years the study of mnemonics lay dormant until interest renewed in the second half of the twentieth century. Psychology has gone through major upheavals in the twentieth century. The rejection of philosophy and introspection as primary tools for the study of psychology led to the rise of behaviorism and the rejection of 'mental' phenomena. In the rush to be scientific in developing theories and methods, researchers lost their focus on the mind and cognitive processes. It was not until the late 1960s and the 1970s that studies of perception, memory, and cognitive processes once again gained prominence (*see* Educational Learning Theory; Learning Theories and Educational Paradigms; Zimmerman and Schunk, 2003). Some of the earliest studies of memory reexamined the classical mnemonic systems in an attempt to identify and understand the cognitive processes involved in creating and using them. In the 1970s this literature was enriched by the work of Flavell and others on what he called 'metacognition' (Flavell, 1979). Metacognition refers to thinking about thinking. It focuses on knowledge, reflection, and analyses of how an individual thinks and learns (*see* Metacognitive Development: Educational Implications; Hacker et al., 2009). Building on both of these themes, researchers increasingly turned their attention to cognition, the variables that impact cognition, and the degree to which cognition can be influenced through educational interventions. This is the research that led most directly to the study of learning to learn.

Types of Learning to Learn Strategies

Claire Ellen Weinstein and Richard E. Mayer (1986) summarized much of the research and findings in 'learning to learn' and developed a taxonomy to describe the six major categories of learning strategies. The following is a summary of the categories in the taxonomy.

Rehearsal Strategies for Basic Learning Tasks

Many instructional tasks require simple recall. The acquisition of basic knowledge, however, is often just a first step in the creation of a more extensive and integrated knowledge base in an area. An example of a task in this category is memorizing the order of the colors in the spectrum. A useful strategy for this type of learning might be to repeat, in sequential order, the names of the colors.

Rehearsal Strategies for Complex Learning Tasks

Learning tasks in this category are more demanding and tend to involve knowledge and skills extending beyond the superficial learning of lists or unrelated bits of information. Examples of strategies in this category would include highlighting class notes or copying key ideas from the class readings. Like the rehearsal strategies for simple tasks, these methods are often most appropriate in the early stages of building a knowledge base in an area.

Elaboration Strategies for Basic Learning Tasks

Meaningful learning often involves building bridges between what is already known and what a student is trying to learn. Elaboration strategies help the student build these bridges by using previous knowledge or experiences to add to what he or she is trying to learn as a way to make the new information more meaningful and memorable. Examples of strategies in this area include generating a mental image of a scene described in a novel and relating a scientific principle to everyday experience. The facilitating effect of using these strategies is usually attributed to both the processing that is involved in creating the elaboration and the product itself.

Elaboration Strategies for Complex Learning Tasks

Strategies in this category help the learner to be more active in building bridges between prior knowledge or experience and more complex tasks. Examples of strategies in this category include paraphrasing and summarizing, applying a problem-solving strategy to a new problem, creating analogies, and using everyday experience to help understand a new concept.

Organization Strategies for Basic Learning Tasks

Organization strategies involve translating or transforming information into another form and creating some sort of scheme to provide structure for this new way of characterizing the information. Examples of organization strategies for basic tasks include grouping foreign language vocabulary words by their parts of speech and grouping the battles of World War II by their geographic location. Like elaboration strategies, the facilitating effect of organization strategies is usually attributed to both the processing that is involved in creating the organization and the product itself.

Organization Strategies for Complex Learning Tasks

Complex tasks can often be made more meaningful and more manageable by using organization strategies. Examples of strategies in this category include creating a hierarchy of main ideas to use in writing a term paper, generating a force diagram in physics, or creating an outline for the class notes from

a section of a course. Like all of the strategies in the elaboration and organization categories, it is both the process and the outcome that appear to help in both knowledge acquisition and later recall and performance.

Model of Strategic Learning

As research in 'learning to learn' expanded in the 1980s and 1990s, it became clear that a number of different factors contribute to and influence both choice and type of strategy used by a student (*see* Self-Regulated Learning; Weinstein and Acee, 2013; Zimmerman, 2008). For example, it is not enough for a student to know about different types of learning strategies. He or she must also know how to use them and under what conditions it is appropriate to use them. Another factor that affects the strategies selected and used by a student is the social contexts of both the educational setting, in general, and the individual classroom. There are also support variables that affect a student's attitudes and beliefs about learning and his or her motivation to succeed. These variables help to generate a context in which effective learning can take place. For example, a student must be clear about his or her long-term and short-term academic goals in order to use them to aid his or her motivation to initiate and maintain use of effective learning strategies.

In the past researchers and educational program developers have usually focused on one or a subset of topics within learning to learn, such as cognitive elaboration strategies or student motivation. Current work is purposefully examining the interaction among two or more components related to the acquisition and use of learning strategies (see Pintrich, 2004; Schunk et al., 2008; Weinstein and Acee, 2013; Weinstein et al., 2011; Zimmerman and Schunk, 2011). This change is a result of the increasing understanding of the nature of student learning and school achievement at all educational levels. Researchers have found that it is the interaction among varying factors that results in successful learning and transfer of new knowledge and skills. The components that seem to have the greatest impact on a student's acquisition and use of learning strategies are summarized in a model developed by Weinstein and her colleagues at the Cognitive Learning Strategies Project located at the University of Texas at Austin in the USA (see **Figure 1**).

This model is an extension of the earlier model developed by Weinstein and Mayer (1986) and has been described in other publications, including Weinstein and Acee (2013), Weinstein et al. (2011), and Weinstein et al. (2000). It focuses on variables impacting strategic learning: learning that is goal driven. Briefly, the core of the model is the learner's long-term learning goals and self-system variables. Goals are considered to be critical components that provide direction for self-regulating thoughts and actions and for generating and sustaining the motivation necessary to carry out those thoughts and behaviors. A hallmark of a strategic learner is that he or she sets specific and challenging, yet realistic,

Figure 1 Model of Strategic Learning.

learning goals and actively pursues them. These learning goals are outcomes to be achieved in and of themselves, but are also subsumed within larger and much longer-term goals and thereby have a future utility value. However, setting specific learning goals is necessary but not sufficient to ensure successful learning outcomes. A strategic learner must also have the skills, motivation, and self-regulatory thoughts, beliefs, and behaviors necessary to successfully pursue such goals. The core of the model is surrounded by these three components: (1) the learner's 'skill' levels in relation to the learning task at hand; (2) the learner's 'will' or motivation to accomplish the desired outcome; and (3) the learner's 'self-regulating thoughts, beliefs, and actions' (sometimes referred to as executive control processes in earlier literature). It is the properties that emerge from the interactions among the learner and these components that are at the core of 'learning to learn.' For any given learning task, the student must take into account variables from each of these components.

Assessment of Learning to Learn

A preponderance of the literature in learning to learn focuses on creating conceptual and instructional foundations for possible interventions to help students become more strategic and self-regulated learners. However, in order to develop interventions it is necessary to be able to assess where students' existing strengths lie and the areas in which they need to improve. Diagnostic–prescriptive measures of students' current strengths and weaknesses in strategic and self-regulated learning provide (1) an initial snapshot of students' status as a strategic learner; (2) a tool to help students become more aware of their own strengths and areas needing improvement; (3) a basis for prescribing interventions and individualizing within more complex interventions (such as a semester-long course in learning to learn); (4) a pre/postintervention to both demonstrate student progress and identify areas needing further development; and (5) an evaluation tool to help determine the effectiveness of interventions for aggregate, subgroup, and individual students.

Many different methods and tools have been developed to help assess learning to learn. These include using talk-alouds, checklists, and questionnaires (Weinstein and Acee, 2013; Zimmerman, 2008). Talk-alouds can be concurrent or retrospective. Basically, students are asked to verbalize their thoughts as they are completing a learning task or studying for a class. Although talk-aloud assessment methods are useful for identifying different ways in which students approach learning tasks, they are difficult to use as diagnostic–prescriptive assessments of students' learning approaches in general because they usually focus on one particular activity. Additionally, the act of reporting thinking processes in concurrent talk-alouds interferes with the very processes being studied, and a retrospective self-report about specific tasks is subject to the reconstructive additions and modifications of memory. Checklists are another way to help identify students' strategic learning strengths and areas needing improvement. Using checklists often involves creating lists of different strategies for one or more types of learning tasks and asking students to check the strategies they use. One problem with checklist assessment methods is that students do not have the option of indicating the degree to which they used or relied upon particular strategies. Furthermore, students often check off more strategies than they actually use, which often results in higher correlations with social desirability than performance.

Perhaps a relatively more effective approach to creating diagnostic–prescriptive learning to learn assessments has been to use questionnaires that capitalize on some of the strengths of talk-alouds and checklists while reducing some of the pitfalls. However, it is important to note that since we are talking about cognitive, metacognitive, emotional, affective, and behavioral thoughts and actions, these are still self-report measures and are susceptible to students' level of self-knowledge and accurate reporting of that knowledge (e.g., responding in a socially desirable manner) as well as some of the problems discussed for talk-alouds and checklists. There are two leading measures of learning to learn processes and skills: the *Motivated Strategies for Learning Questionnaire* (MSLQ; Pintrich et al., 1991) and the *Learning and Study Strategies Inventory* (LASSI; Weinstein et al., 2002). Both questionnaire assessments address different areas of strategic learning but the MSLQ places greater emphasis on specific theoretical components of motivation and the LASSI is more broad spectrum including topics ranging from motivation to comprehension monitoring, generating and using study aids, and preparing for exams. The LASSI is a widely used instrument for learning to learn interventions and will be discussed in more detail as an example of a measure of strategic and self-regulated learning.

"The LASSI is a 10-scale, 80-item assessment of students' use of learning and study strategies related to skill, will, and self-regulation components of the Model of Strategic Learning" (Weinstein and Palmer, 2002). Students respond using a Likert-type scale ranging from 1 to 5, where 1 is not at all typical of me, 2 is not very typical of me, 3 is somewhat typical of me, 4 is fairly typical of me, and 5 is very much typical of me. The assessment items do not ask students about specific instances when they studied or tried to learn something but rather what is typical of them in different learning contexts, topics, and task types. The 10 scales on the LASSI are Anxiety, Attitude, Concentration, Information Processing, Motivation, Selecting Main Ideas, Self-Testing, Study Aids, Test Strategies, and Time Management. The factors measured by the LASSI have been found to contribute significantly to success in college and be amenable to improvement through educational interventions (see Weinstein and Acee, 2013). This is important for a diagnostic/prescriptive assessment. A number of variables that relate to learning success and that could be measured, such as certain types of personality factors, are not amenable to educational interventions in a high school or college setting. Although they can be quite diagnostic, they are not prescriptive in that they do not help identify areas of remediation or enhancement that can be targeted in an educational intervention. With regard to reliability, the Cronbach's alpha coefficients for all 10 scales range from a low of 0.73 to a high of 0.89 (Weinstein and Palmer, 2002). It is interesting to note that Weinstein and her colleagues developed a metacognition scale for the LASSI but it correlated at 0.7 and above with every other LASSI scale, suggesting that metacognition is foundational to many elements of strategic and self-regulated learning and

cannot be teased apart easily. However, the scale that focuses on self-testing does address a subset of metacognitive processes referred to as comprehension monitoring – checking our understanding during class or study sessions to see if we are really understanding the material.

The LASSI can be used as "… (a) a diagnostic measure to help identify areas in which students could benefit most from educational interventions; (b) a basis for planning individual prescriptions for both remediation and enrichment; (c) a means for instructors to use for examining individual students' scores and class trends to help make decisions about instruction, assignments, etc.; (d) an evaluation tool to assess the degree of success of strategic learning intervention courses or programs; and (e) an advising/counseling tool" to direct students to helpful resources or place them in a learning to learn class (Weinstein and Acee, 2013). Students can generate declarative (knowing about a variety of learning strategies), procedural (knowing how to effectively and efficiently use a variety of learning strategies), and conditional (knowing when and under what circumstances it may be useful to use particular learning strategies) knowledge and skills in each of the categories of the LASSI scales. Each form of knowledge can help students reach their learning goals more effectively and efficiently across a variety of learning environments. Students also need to know how to pick and choose learning strategies from among the various elements within the skill, will, and self-regulation components of the MSL to help them reach specific learning goals and objectives. For example, students experiencing high levels of anxiety about an upcoming math exam might need to use strategies to reduce their anxiety before they can effectively use information processing strategies to study for the exam. The next sections will highlight the individual LASSI scales and the component of the MSL that they are most related to conceptually. This discussion of the LASSI is taken directly from the *User's Manual* with permission from the authors and publisher (Weinstein and Palmer, 2002).

LASSI Scales Most Related to the Skill Component of Strategic Learning

The LASSI scales most related to the skill component of strategic learning are Information Processing, Selecting Main Ideas, and Test Strategies. These scales examine students' learning strategies, skills, and thought processes related to identifying, acquiring, and constructing meaning for important new information, ideas, and procedures, and how they prepare for and demonstrate their new knowledge on tests or other evaluative procedures.

The Information Processing Scale assesses how well students can use imagery, verbal and visual elaboration, organization strategies, and reasoning processes as learning strategies to help learn new information and skills and to build bridges between what they already know and what they are trying to learn and remember. Do students try to summarize or paraphrase their class reading assignments? Do they try to relate what is being presented in class to their prior knowledge? The Selecting Main Ideas Scale assesses students' skill at identifying important information for further study from less important information and supporting details. Can students identify the key points in a lecture? Can they decide what is important to underline in a textbook? The Test Strategies Scale assesses students' use of both test preparation and test taking strategies. Do they know how to study for tests in different types of courses? Do students review their answers to essay questions?

LASSI Scales Most Related to the Will Component of Strategic Learning

The LASSI scales related to the will component of strategic learning are Anxiety, Attitude, and Motivation. These scales measure the degree to which students worry about their academic performance, their receptivity to learning new information, their attitudes and interest in college, and their diligence, self-discipline, and willingness to exert the effort necessary to successfully complete academic requirements. The Anxiety Scale assesses the degree to which students worry about school and their academic performance. Do students worry so much that it is hard for them to concentrate? Are they easily discouraged by low grades? The Attitude Scale assesses students' attitudes and interests in college and achieving academic success. How clear are students about their own educational goals? Is school really important or worthwhile to them? The Motivation Scale assesses students' diligence, self-discipline, and willingness to exert the effort necessary to successfully complete academic requirements. Do they stay up to date in class assignments? Do students easily 'give up' in difficult classes?

LASSI Scales Most Related to the Self-regulation Component of Strategic Learning

The LASSI scales related to the self-regulation component of strategic learning are Concentration, Self-Testing, Study Aids, and Time Management. These scales measure how students manage, or self-regulate and control, the whole learning process through using their time effectively, focusing their attention and maintaining their concentration over time, checking to see if they have met the learning demands for a class, an assignment, or a test, and using study supports such as review sessions, tutors, or special features of a textbook. The Concentration Scale assesses students' ability to direct and maintain their attention on academic tasks. Are students easily distracted? Can they direct their attention to school tasks? The Self-Testing Scale assesses students' use of reviewing and comprehension monitoring techniques to determine their level of understanding of the information or task to be learned. Do the students review before a test? Do they stop periodically while reading to review the content? The Study Aids Scale assesses students' creation and use of support techniques, materials, or resources to help them learn and remember new information. Do students complete practice exercises? Do they create or use organizational aids? The Time Management Scale assesses students' use of time management principles and tactics for academic tasks. Are students well organized? Do they anticipate scheduling problems?

Once students and educators know the strengths and weaknesses of their students' learning to learn skills and strategies, the next step is to develop, adapt, use, and evaluate

interventions designed to address students' weaknesses and build on their strengths. In the next section, types of interventions will be described with a focus on a semester-long intervention for students who are particularly weak in a number of areas in the Model of Strategic Learning (MSL) and measured by the LASSI.

Learning to Learn Interventions

A number of different types of academic prescriptions and applications have been developed to enhance students' learning to learn skills, motivation, affect, and behavior (see Hodges and Agee, 2009). These research-based interventions have been primarily developed for college or university students but are currently being expanded to focus on K-12 education as well, particularly for high school students. Part of the difficulty teaching learning to learn strategies to younger students is the developmental progression in thinking that takes place as children age. Many of the strategies that have been studied require a level of cognitive ability beyond the scope of younger children. However, some researchers are directing their attention to precursors of more sophisticated adult learning to learn skills and processes, and this is an exciting area for both future research and application (Kaya and Kablan, 2013; Kitsantas et al., 2009).

Interventions developed to enhance college students' learning to learn strategies include workshops and short courses, tutoring, supplemental instruction (SI), and extended interventions (e.g., semester-long learning to learn courses, paired courses, and summer bridge programs).

Workshops and Short Courses

Workshops and short courses will usually target specific strategies and skills, such as goal setting, time management, elaborative note taking, learning from text, and comprehension monitoring. Their duration varies but usually ranges from 1 to 8 h. These interventions are often delivered by learning center staff, counselors, or content-area instructors with a background in, or related to, educational psychology. In some cases, these interventions are integrated within content-area courses. Although these interventions can be helpful, they are not as powerful as more extensive interventions (like a semester-long learning to learn course) because the content of the workshop is generally isolated from other core elements of strategic learning that may interact with the process being taught. For example, a workshop teaching reading strategies for mathematics textbooks may not be as effective if part of the problem is that the student has no goals or interest in learning mathematics. One of the first things this student would need to do is work on his or her motivation, for example, by learning and implementing goal setting and interest enhancement strategies.

Tutoring and SI

Tutoring is another delivery mode that has been researched as a means to help students develop and expand their repertoire of learning to learn strategies. Tutoring usually occurs in a one-to-one or small group setting and either focuses directly on teaching learning to learn or embeds the instruction in the help given students with the content they are having trouble understanding. It is a targeted intervention usually restricted to one content area, such as biology or psychology, so teaching students how to transfer what they are learning about how to learn to other courses is not a priority. Tutors can be students who excelled in the target course in a previous semester and are trained how to be an effective tutor, paraprofessionals who undergo a formal training program, or professional student support personnel who undergo more extensive training in tutoring and higher education. SI is a more elaborate and extended form of tutoring and can take a variety of forms. In its most basic form SI is an academic support program that uses peer-assisted supplementary class sessions to enhance student performance and retention in classes that historically have high failure and/or low retention rates. The peer leaders are usually students who succeeded in the course previously and they help current students by providing regular review sessions, getting students to work collaboratively with others in the class, discuss readings, and prepare for tests. Some SI leaders also incorporate how to study the content area while they help clarify and explain the material. SI can be an option in a course, required, or, in multiple-section courses, it can be a component of a subset of the sections. It has proved to be highly effective, particularly for high-risk courses. Although SI is an extended intervention that takes place across an entire semester, it focuses on a particular subject matter. It is a highly successful intervention but limited in its generalizability to other courses in different content areas. Of course, this is not the goal for SI. For researchers more interested in the acquisition of a range of learning to learn skills and strategies that can be applied to a variety of content areas and a number of different academic tasks, more extended and extensive interventions have been developed and investigated.

Extended Leaning to Learn Interventions

Extended learning to learn interventions include (1) semester-long courses in learning to learn (often called strategic learning, learning strategies, or learning frameworks courses); (2) paired courses, where a learning to learn course is paired with the same content-area course and the learning to learn strategies and skills being learned can be applied and reinforced in the content-area course; (3) summer bridge programs that incorporate an intensive and often condensed learning to learn component; and (4) implementing a metacurriculum that involves content-area instructors teaching students how to learn the content of their courses in addition to teaching the content itself.

Semester-Long Learning to Learn Courses

Semester-long learning to learn courses focus on a wide variety of learning strategies and skills from all of the components of the MSL (see Weinstein and Acee, 2013; Weinstein et al., 2000). In the United States, these courses are found in all types of tertiary education but are most often housed in 2-year academic and vocational training settings. Extended

interventions are designed to help students improve in areas where they are not strong (as measured by an instrument such as the LASSI) and excel in areas where they have existing strengths. Although these courses do not focus on any one specific academic subject area, they do use materials from a variety of majors, subject courses, and academic tasks to help students transfer their new knowledge and skills to their other concurrent and future classes. These courses can be enormously successful. For example, the effectiveness of a strategic learning course taught at the University of Texas at Austin that has been developed by Weinstein and her associates is evidenced by highly significant increases in general academic performance, reading comprehension, and retention to graduation. It is important to note that this is not simply a result of increased motivation by students who take the course. In fact, most students are forced into the course and both waiting list control groups and statistical control groups evidence much lower performance and retention.

Paired Courses

Paired courses is a related intervention where students participate in a learning to learn course as well as another academic course where the instructor gives the students opportunities to practice using their new knowledge and skills. The two instructors work together to integrate the two curricula and sometimes this includes sharing information across the semester on student progress. Usually, the paired course is one where students have traditionally had difficulty succeeding. This type of extended intervention capitalizes on the SI model but includes instruction in a wider variety of learning skills and strategies that can be used in other courses as well.

Summer Bridge Programs

Summer bridge programs are one other form of extended intervention. These can involve either a stand-alone course in learning to learn or paired courses. They are usually targeted to students who are identified to be at risk for low achievement, dropping out, or failure. The idea is to provide helpful strategies and skills before the students enter tertiary education. Often, summer bridge programs will also focus on adapting to the demands of college academically, personally, and socially to help students develop a realistic view of what college will be like for them, the resources available to help them, and the academic demands and rigor that will be required.

Current Research, Methodological Issues, and Directions for Future Research

Much of the current research in learning to learn has focused on improving student learning outcomes, primarily in college or tertiary settings. Researchers have demonstrated the effectiveness of teaching learning to learn strategies to students, often with quite dramatic results (see Hodges and Agee, 2009). These results have also been robust across content domains, individual classes, and years of college.

Given the importance of learning to learn for student achievement and retention to graduation, additional research is needed to address some of the methodological and conceptual issues in this area. First, there is a need for the development of consistent terms for the various aspects of learning to learn. Currently, each individual or group of researchers uses somewhat different terms to often describe very similar ideas and processes. Second, there is a need for the further development of models of learning to learn at the global level and at more task-specific levels. Third, more knowledge is needed about the nature of transfer of 'learning to learn' strategies. Fourth, measurement of 'learning to learn' strategies and processes needs to be refined. Current instruments like the *Learning and Study Strategies Questionnaire* and the *Motivated Strategies for Learning Questionnaire* are good general diagnostic screening measures, but more precise measurements of the components of 'learning to learn' and how they interact in a given traditional, blended, or online learning context are needed. Fifth, additional developmental work to create instructional paradigms to teach learning to learn in traditional, blended, and online learning contexts is needed.

'Learning to learn' is crucial for success in any learning context. As society moves toward a world where lifelong learning is a fundamental reality, the importance of understanding and using learning to learn strategies will only increase.

Legal Bases of Social Work

Michael Preston-Shoot, University of Bedfordshire, England

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article explores the relationship between law and social work. It navigates the importance of the relationship and the similarities and differences between the objectives of legal and social work practitioners. It critically reviews transnational conventions and how individual countries have legislated to safeguard and promote the welfare of children and adults at risk. It reflects on how far nation-states uphold human rights and the rule of law and evaluates how social work has been positioned and has performed in different legislative contexts.

Introduction

Why should social work concern itself with law and with the legal frameworks for practice? Why is applying law to social work identified as a key component of qualifying education across countries with either developed or developing social welfare provision, for example in Europe (Adams et al., 2001), Australia (Swain and Rice, 2009), Israel (Doron et al., 2010), and India (Menoa, 2002)?

Perhaps, most obviously, social work practice does not operate in a vacuum. It is located in a context, a country's history, culture, and politics (Tice and Long, 2009), which combine to shape its development of legal rules and its response to people's needs. Thus, social work resides within a macro context with degrees of debate about social policy. It engages both in a micro-context when it interacts with individuals and their families and communities, and in a mezzo- or organizational context when it participates in a process by which legal rules and social policy intentions are translated into operational procedures.

Less obviously but no less critically, social workers are themselves citizens whose lives, along with those with whom they work, are shaped significantly by what is (not) legislated, the content of and omissions from the legal rules. Their lives will be shaped by how legislation is interpreted and implemented through local procedures and practices, and by how authority is exercised by decision-makers. As citizens and as professional practitioners, social workers will be profoundly affected by the values which the legal rules uphold and promote (Preston-Shoot et al., 2001).

Moreover, social work has positioned law centre-stage. With human rights and social justice as principled commitments, and with promoting individual and social change to enhance people's well-being as a core focus (IFSW/IASSW, 2001), social work engages both ethics and law. However, despite its commitment to challenging national governments and social welfare organizations when policies and practices are oppressive, inhumane, and unethical (Hölscher and Berhane, 2008), its leadership on and advocacy for human rights and social change has not been unequivocal (Laird, 2007; Healy, 2008; Preston-Shoot, 2010).

Equally, social work education and practice has been slow to develop guidance on how practitioners and managers should respond when legal rules and professional ethical standards collide rather than converge. Social workers and legal practitioners have arguably also been slow to appreciate the contribution that each other's professionalism can make to their practice (Dickens, 2005; Zifcak, 2009).

Accordingly, this contribution locates social work within national legal rules and transnational conventions prior to identifying critical questions for practitioners, managers, and educators. These questions consider how countries approach the development of social work provision, and the promotion of equality and human rights. They explore critically how countries respond to social issues, including the balance struck between the needs of children and adults at risk with available resources. The contribution closes by reviewing the impact of national and transnational principles and legal rules on people's quality of life, and of social work as an independent, critical voice and practice on behalf of those who face disadvantage.

Transnational Declarations

Perhaps because national governments acknowledge the need to act collectively to guarantee human rights, the number of supranational conventions is growing. Some relate to specific continents, for example the European Convention on Human Rights and Fundamental Freedoms (ECHR) (1950), the European Social Charter (1961), the African Charter on Human and People's Rights (1968), the African Charter on the Rights and Welfare of the Child (1999), and the American Declaration on Human Rights (1969). Others are global in ambition, such as the Universal Declaration of Human Rights (1948), UN Convention on the Rights of the Child (UNCRC) (1989), the International Covenant on Economic, Social and Cultural Rights (1966), the International Convention on the Elimination of all forms of Racial Discrimination (1969), the Convention on the Elimination of all forms of Discrimination against Women (1979), the UN Convention on the Rights of Persons with Disabilities (2006), and the UN Standard Minimum Rules for the Administration of Juvenile Justice (1985).

Key principles, aligning closely with social work values, emphasize fair and humane treatment, social inclusion, promotion of health and well-being, equality, protection, dignity, and social justice. They advance a rights-based discourse and represent a powerful advocacy and

 http://dx.doi.org/10.1016/B978-0-08-097086-8.28050-1

empowerment tool for social groups and the social welfare professionals working with them (Doron and Apter, 2010). However, their reach and impact are nullified if ratification by individual countries does not subsequently translate into implementation of their principles and standards in national laws and policies (Nicklett and Perron, 2010). Explanations vary for failing to legislate nationally to embed the conventions in state jurisdictions but include a preference to express human rights through cultural and religious traditions (Skegg, 2005), resource austerity and opposition from government departments or third sector organizations (Tang, 2003).

The rights contained in transnational declarations remain soft (Tang, 2003) and limited in their effectiveness not just when they are not embedded in national jurisdictions but also when their recommendations and safeguards are nonbinding. Without sanctions for noncompliance (Mishra, 2005), the rights risk being declaratory and symbolic rather than a force for meaningful social change (Doron and Apter, 2010). Thus, despite the UN Standard Minimum Rules for the Administration of Juvenile Justice, not all states have created a separate system from adult criminal justice for young people or raised the age from which children can be prosecuted for offences. Similarly, the African Charter on Human and People's Rights creates a commission to promote such rights as to life, liberty, education, and the best attainable physical and mental health, but not a court capable of providing redress to individuals. Moreover, even when bodies such as the International Court of Justice are created, less than a third of states represented in the United Nations accept such jurisdiction (Bingham, 2011), while the UK government is probably not alone in behaving lukewarmly toward the European Court of Human Rights depending on the outcome of its judgments.

The UK's approach to unaccompanied asylum-seeking minors, the age of criminal responsibility for children, and corporal punishment, falls outside the UNCRC, for which it has been sharply criticized but has remained apparently unmoved (Braye and Preston-Shoot, 2009). This illustrates how adherence to UNCRC principles by national governments has been piecemeal and half-hearted (Nicklett and Perron, 2010). By contrast, unfavorable judgments in the European Court of Human Rights, which enforces the rights contained in the ECHR, have led to changes in legislation in the UK and other signatory states, with a direct impact on social work practice (e.g., Gaskin v UK [1986] 12 EHRR 36; Z v UK [2001] 2 FLR 612). Here then is an example of how individual citizens can hold national governments and their agents accountable for acts of abuse, harm, omission, and discrimination.

The picture of incomplete protection is reinforced by gaps within the framework of human rights, including the absence of an international convention on the rights of older people (Doron and Apter, 2010), and the failure to articulate what levels of social rights, or norms and standards of social provision, are feasible when considered against the resource capacity of individual nation-states (Mishra, 2005).

Holding Governments Accountable

With its espoused commitment to human rights and social justice (IFSW/IASSW, 2001), social work might be expected to engage with holding local and national governments accountable for how people's needs are met and their rights protected. Where countries as diverse as South Africa (Sachs, 2009) and the Czech Republic (Chytil and Popelková, 2000) have constitutions, close scrutiny reveals what rights and freedoms are upheld and the ease with which citizens may access constitutional courts. Where countries have developed or developing systems of human rights and the rule of law, as in the UK (Bingham, 2011) and Mongolia (Namdaldagva et al., 2010), detailed monitoring is required of how legal rules codify individual needs and rights, accord power to state organizations, and facilitate citizens to hold such agencies accountable for abuse of power through access to legal remedies. As Bingham (2011) argues, the price for complacency can be despotic democracy or elected dictatorship.

The Forum for a New World Governance (2011) offers one assessment of how individual countries perform on five domains, namely peace and security (including approach to refugees, asylum seekers, and violent crime), rule of law (including independence and effectiveness of the judiciary), human rights and participation (covering respect for civil rights and promotion of equality), sustainable development (embracing employment protection), and human development (including quality of life and promotion of well-being). On overall rankings Scandinavian countries occupy the first five places, with other results including New Zealand (6), Australia (9), Canada (12), France (15), the UK (18), the US (32), Israel (49), Croatia (50), South Africa (68), Mongolia (75) Thailand (85), and Vietnam (120).

This assessment contextualizes reports from social work and legal practitioners of abuses of power. These include the abrogation of civil liberties and human rights in the UK and the US (Bingham, 2011), the systematic violation of civil rights in Eritrea (Hölscher and Berhane, 2008), variable responses to crimes motivated by hate (Pollack, 2009), and the violation of human rights and social justice in West African states by sexual abuse, neglect of disabled children, child labor, and trafficking (Sossou and Yogtiba, 2009). In the UK, public authorities and legal systems use human rights positively to protect individuals and communities. Nonetheless, human rights could be protected more fully (EHRC, 2012), evidence uncovering failures to protect the rights of children and disabled people, abuse of vulnerable people in institutional care, and degrading treatment toward victims of human trafficking and unaccompanied asylum-seeking minors.

The index, in evaluating how countries promote the rule of law and human rights, captures how far national jurisdictions embrace social and economic rights alongside civil and political rights (Skegg, 2005; Sachs, 2009). It clearly reveals that ratification of international and regional conventions, and passing of national legislation, is no guarantee that children and adults at risk will be protected, perhaps because of a lack of state infrastructure, the influence of cultural norms, and poverty of resources (Sossou and Yogtiba, 2009). Even where a legislative and procedural perspective emphasizes dignity, respect, and inclusion, in countries such as Australia, Scandinavia, and the UK, it is not just resources which create a gulf between policy intentions and practice outcomes, but also professional attitudes whereby social work staff and agencies

fail to advocate for, and protect service users (Johnson and Marriott, 2009; Preston-Shoot, 2010).

National Social Welfare Legislation

Social work is located within country-specific legal rules which express a nation-state's social policy. Social work is therefore shaped by and should comment on the balance that is struck between empowerment and protection of individuals, families, and communities; voluntary engagement with or enforced control of people at risk, such as those who misuse drugs and alcohol; and upholding individual autonomy or acting in someone's best interests (Fasol and Fraccaroli, 2001). Legislative activity on social welfare issues may be reluctant or enthusiastic, partial or ambitious, ambivalent or assertive on human rights and equality, evidence informed or ideologically driven, and motivated by religious convictions or secular orientations. Legal rules may benefit or disenfranchise people with diverse social problems and will shape the relationship between public service providers and independent welfare or nongovernmental organizations (Klug, 2001). Social work is well placed to comment on the degree to which needs are met by current national legislation and welfare systems (Sasaki, 2010).

Social work acquires powers and duties, roles, and tasks, from legislation, for example in the UK and Finland (Hämäläinen and Niemalä, 2000). However, social workers should act collectively in their national context to comment upon the degree to which those in need or at risk have legal rights or entitlements to assistance (Erath et al., 2000) through a state's constitution or rule of law. Thus, how far are legal rules framed around notions of need, who is (not) deserving of assistance, or principles of social cohesion, citizenship, inclusion, and civil rights (Feu, 2000; Jovelin and Tully, 2000)? Critique is possible of how legal rules and social policy articulate or ignore the assistance required by those in need due to older age, poor health, poverty, homelessness, mental distress or incapacity, unemployment, and child abuse or neglect (Feu, 2000; Erath et al., 2000; Chytil and Popelková, 2000; Hämäläinen and Niemalä, 2000). Social work advocacy may be important as different nation-states, for example in Asia, struggle to frame a legislative response to rapid growing social, environmental, and economic challenges, such as racial discrimination (Oommen, 2002); drug abuse; population and ecological pressures; hate crime, child sexual exploitation, and human trafficking (Thi Thai Lan et al., 2010; Zaviršek and Herath, 2010; Namdaldagva et al., 2010). Similarly, detailed challenge may be necessary as states debate whether to extend beyond civil and political rights toward social, economic, and environmental rights, and as legal rules struggle with questions of distributive justice and relational justice – with how goods and services are made available and with how power is shared and meaningful participation guaranteed to citizens (Tice and Long, 2009).

Thus, for example, child care and child protection legislation has been enacted and, to varying degrees, given statutory roles to social workers, in West African states (Sossou and Yogtiba, 2009), Vietnam (Thi Thai Lan et al., 2010), Taiwan (Lin and Wang, 2010), Japan (Sasaki, 2010), Costa Rica (Tice and Long, 2009), and Nepal (Nikku, 2010). Equally, concern exists about the lack of protection for children at risk, for example in Malawi and Mongolia (Tice and Long, 2009) and in China (Scannapieco and Batchelor, 2012) where legislative support is limited and perhaps an impediment to the development of a public child welfare infrastructure. The position in respect of countries enacting legislation on child trafficking, and then giving social work a prominent role, is variable.

Similar variability can be found with respect to disabled people, older people, gender equality, and domestic violence, with positive legislative developments, for example, in Japan and Taiwan (Sasaki, 2010; Lin and Wang, 2010) but concerns about the adequacy of legal frameworks to protect older and disabled people in Portugal (Carvalho, 2012), Kenya, Ghana, and Zimbabwe (Mba, 2007), and across African states and the UK (Krug et al., 2002; Daichman, 2005; Ozanne, 2009; Braye et al., 2012).

However, social work's critique must also extend to consider whether the legal rules are accessible, intelligible, clear, and predictable (Bingham, 2011). Adult protection research in the UK has found that social workers and other professionals experience considerable difficulty in understanding the legislative requirements, for example on the interface between human rights and the sharing of confidential information, and in negotiating the boundaries between an individual's right to autonomy in their private and family life and their mental capacity (Perkins et al., 2007; Pinkney et al., 2008). The volume and complexity of the legislation does not necessarily serve the rule of law (Bingham, 2011) or facilitate the meeting of their needs.

Three cautionary notes should be sounded here. The first is about expecting too much of the law alone. Sachs (2009) advises skepticism of the law's claims but avoidance of cynicism about its possibilities. Put another way, helping people meet their needs and overcome disadvantage and oppression requires law and social work values, knowledge, and skills (Braye and Preston-Shoot, 1990). The second is that social work has not consistently engaged in legislative debates about social questions (van der Laan, 2000). The third is that the level of a country's economic development is a blunt predictor of the degree to which it commits to the development of the rule of law, human rights, and the protection of children and adults at risk (Nicklett and Perron, 2010; Forum for a New World Governance, 2011). Although less industrialized countries generally have lower levels of legislative activity than middle-income countries, the pattern is not uniform, as the 2011 governance index reveals for countries like Costa Rica and Namibia.

Implementing Legal Provisions

Previous sections charted the development of the law in theory. Here the focus is on the law in-between (Jenness and Grattet, 2005) – whether and how legal provisions are translated into operational procedures by organizations responsible for the discharge of statutory powers and duties. This is because legislation may be applied in ways not foreseen or intended by legislators (van der Laan, 2001). Lack of legal and organizational infrastructure, poverty of resources, poor planning, professional cultures, excessive workloads, lack of coordination

and personal attitudes among the workforce may explain this phenomenon (Braye and Preston-Shoot, 2009; Nicklett and Perron, 2010).

Implementation problems include mandatory reporting in Cyprus of domestic violence (Panayiotopoulos, 2011), the failure to protect children from being trafficked and enforce provisions for treating young offenders separately from adults in Nepal and the Philippines (CLRRD, 2002; Boele, 2005), and the availability of direct payments for adults requiring community care support in the UK (Braye and Preston-Shoot, 2009). In China, Scannapieco and Batchelor (2012) argue that child abuse is insufficiently addressed, with maltreatment inadequately defined in government policy, and often tolerated as a family matter.

Then there is the law in practice, how social workers, social welfare organizations, and other professionals implement legislative provisions. Examples of institutional abuse, where children have not been protected, for example in the UK, Sweden, Malawi, and Romania (Tice and Long, 2009), illustrate the challenges involved in ensuring that those responsible for safeguarding and promoting the welfare of young people know what the legal rules expect of them and have the values, knowledge, and skills to meet their professional responsibilities. Sometimes social workers have exposed these abuses and experienced considerable hostility from their organizational employers as a result; sometimes, however, concerns have not been escalated about known abuses and practice failings (Kline and Preston-Shoot, 2012). A similar picture emerges regarding adults in need or at risk (Preston-Shoot, 2010).

Regulating Social Work

Whether social work exercises vigilance and advocacy concerning how social welfare legislation is developed and implemented will depend, partly, on if it is recognized and supported nationally. Currently, a minority of African countries have social work education programs (Sossou and Yogtiba, 2009). In Asia, a variable picture emerges, with governments yet to formally recognize social work in Nepal (Nikku, 2010) and Vietnam (Thi Thai Lan et al., 2010) but Taiwan and Japan have systems of certification and examination in order for people to practise as social workers (Lin and Wang, 2010; Sasaki, 2010). In China, social work education programs have proliferated but, as a profession, social work has yet to become established, with its role and status recognized (Liu et al., 2012).

The position on social work regulation also varies. Across Europe, some states have developed or are evolving systems of regulation and protected title (Hämäläinen and Niemalä, 2000; Shardlow, 2001). In one review (Weiss-Gal and Welbourne, 2008), the UK, Spain, and South Africa had licensing procedures but Sweden, Chile, Hungary, Mexico, and India did not. Such regulation may reinforce notions of professionalism and accountability but does not guarantee ethical or lawful behavior (Preston-Shoot, 2010). While all the countries surveyed had distinctive social work education programs in higher education institutions, not all had a national ethical code and social workers enjoyed variable levels of prestige and status which impacted on their ability to exert influence on policy development. Similarly, social work has not established professional associations across all nation-states, which equally impacts on its ability to exert influence. Moreover, where such associations do exist, dependence on government funding or exposure to political pressure may weaken their autonomy and advocacy (Yu, 2006).

Curriculum

Whether social workers can engage in policy development and advocacy surrounding the legal rules, as well as in case-based tasks, will depend on the content of their qualifying education and continuing professional development. Law is increasingly being taught within social work education, for example in India (Menoa, 2002), Nepal (Nikku, 2010), Vietnam (Thi Thai Lan et al., 2010), and Taiwan (Lin and Wang, 2010). Law is well established in social work curricula in the UK, the US, Israel, and Australia (Braye et al., 2005; Doron et al., 2010; Swain and Rice, 2009).

Evidence about the outcomes of teaching and learning law in social work education is not extensive. However, there is some empirical evidence to suggest that social work students emerge from their qualifying studies more positive about using the law in practice and with greater confidence in their legal knowledge and practice skills (Doron et al., 2010; Preston-Shoot and McKimm, 2012a).

However, in a crowded curriculum, commentators from different countries have expressed concerns that insufficient attention is given to the relationship between law and social work, the socioeconomic and cultural factors that create inequality and disregard for human rights, and the development of knowledge and skills for working with children and adults at risk (Menoa, 2002; Sossou and Yogtiba, 2009; Nikku, 2010; Zaviršek and Herath, 2010; Preston-Shoot and McKimm, 2012b; Spajic-Vrkas, 2012). Social workers may also feel underprepared for actively engaging in political and social struggles, and for deploying advocacy skills in search of law reform (Sabater, 2001; Healy, 2007). Much, then, depends on whether the taught academic curriculum offers learning that focuses not just on the technical content of the legal rules (doing things right) but also on knowledge and skills required to negotiate the interface between law and professional values (doing right things) and between law, social work, and human rights (right thinking) (Braye and Preston-Shoot, 2009). Similarly, much also depends on whether what social workers learn in practice settings supports or undermines what they have been taught (Preston-Shoot and McKimm, 2012b).

One key element in the curriculum is learning about the similarities between law and social work in terms of values, objectives of securing people's rights and best interests, scrutiny of evidence, standards for decision-making and the exercise of authority, use of research, and advocacy (Hämäläinen and Niemalä, 2000; Preston-Shoot et al., 2001; Doron et al., 2010; Zifcak, 2009). Another key element is to develop a critique of both the legal rules and the systems that implement them, coupled with the development of skills to manage situations where law and professional values collide rather than converge, and where legal rules challenge traditional cultural norms (Healy, 2007; Preston-Shoot, 2010). Both elements need greater emphasis in curricula offered by social work education.

Concluding Discussion

Social workers, and their employing organizations, do make positive differences for children and adults at risk, often in challenging circumstances. They have challenged dehumanizing practices and empowered individuals and communities (Noyoo, 2004; Skegg, 2005). However, social work has sometimes failed to promote human rights and social justice, and to enhance the well-being of individuals, their families, and communities (IFSW/IASSW, 2001). This might be because in particular countries the legal rules and welfare frameworks do not exist or are under development, or do not define clearly what are the roles and tasks which social workers may assume. However, there are other possible explanations, including the tendency of social work to shy away from policy issues and from work with the most disadvantaged groups (Noyoo, 2004; Laird, 2007), and location within political situations which require considerable personal resilience and courage to practise according to the IFSW/IASSW statement (Yu, 2006; Healy, 2008; Hölscher and Berhane, 2008). Equally, social workers' professional autonomy may be circumscribed by the conditions of their employment (Weiss-Gal and Welbourne, 2008; Kline and Preston-Shoot, 2012). Their practice might be constrained by excessive bureaucracy and workloads (Chytil and Popelková, 2000; Oommen, 2002; Braye and Preston-Shoot, 2009; Panayiotopoulos, 2011) and/or by resource shortages (Hämäläinen, and Niemalä, 2000; Jovelin and Tully, 2000; Preston-Shoot, 2010).

Social workers must retain ways of exercising their independent voice despite these powerful organizational, structural, cultural, and political constraints, especially when employed by agencies which are reluctant to challenge received governmental wisdom and to uphold people's rights, dignity, and entitlements (Oommen, 2002; Preston-Shoot, 2010; Zaviršek and Herath, 2010). In such an environment the legal rules as expressed nationally and transnationally may provide important support but alone will be insufficient to prevent poor or abusive practice and to ensure the highest standards of ethical, research-informed, knowledge-driven, and skilled social work.

Legal Culture and Legal Consciousness

Susan S Silbey, School of Humanities, Arts, and Social Sciences, Massachusetts Institute of Technology, Cambridge, MA, USA

Abstract

Legal culture and legal consciousness are used analytically to identify the meanings of law that circulate in social relations, referring to what people do as well as say about law. The prefix *legal* characterizes an aspect of the general culture that is associated with law, legal institutions, legal actors, and their behaviors. Culture is used to refer to the system of communicative signs within human groups. Legal *culture* refers to an aggregate (macro or group) level phenomenon; legal *consciousness* usually refers to micro-level social action, specifically the ways in which individuals mobilize, invent, and interpret legal meanings and signs.

The phrases 'legal culture' and 'legal consciousness' are used analytically to identify the meanings of law that circulate in social relations. The prefix *legal* characterizes an aspect of the general culture that is associated with law, legal institutions, legal actors, and their behaviors. Legal *culture* refers to an aggregate (macro or group) level phenomenon; legal *consciousness* usually refers to micro-level social action, specifically the ways in which individuals mobilize, invent, and interpret legal meanings and signs.

Culture and consciousness are hotly debated and contested constructs created by scholars for diverse research purposes; the adoption of these terms specifically in legal scholarship has also been fraught with controversy (Nelken, 2012). The referents of these terms are unstable, both theoretically and empirically. This may be due to a long history in social science as well as common parlance, but it may also be, as Raymond Williams writes, because "culture is one of the two or three most complicated words in the English language" (Williams, 1983: p. 87). Some confusion derives from intermingling two common meanings of culture: as an analytic tool of social analysis referring to the communicative semiotic aspects of human action and as empirically observable ways of doing and thinking that are associated with a particular group or society. In the latter use, describing the distinctive customs, opinions, and practices of a group or society, the term is often used in the plural, as in the legal cultures of Japan and China or in reference to African or Latin cultures. In the former analytic sense, the word is used in the singular, as in legal culture, or the culture of academia. These distinctions need to be clearly specified in using these terms, lest confusion proliferate.

Despite often theoretically obstruse debate, many scholars find the concepts of legal culture and consciousness hard to avoid when they address aspects of law not confined to formal legal materials (such as doctrines, statutes, cases, constitutions) or offices and institutions (such as lawyers, judges, courts). Legal culture and consciousness are terms used to emphasize, for analytic purposes, ways in which formal legal institutions and everyday social relations intersect and share cognitive and linguistic resources.

The Concept of Culture in General

The concept of culture as an aspect of social life has been invoked in numerous ways. Referring primarily to learned behavior as distinct from that which is given by nature or biology, culture has been used to designate everything that is humanly produced (habits, beliefs, arts, and artifacts) and passed from one generation to another. In this formulation, culture is distinguished from nature and also distinguishes one society from another. A narrower conception of culture refers to those human institutions specifically devoted to the production of signs and meanings. In this more limited usage, cultural institutions include, for example, art, music, theater, fashion, literature, religion, media, and education. While the first definition is overly broad including just about all of human life, the second is too specific: the meanings produced and circulating through other institutions and 'noncultural' spheres of life are ignored or devalued.

Contemporary cultural analyses have moved beyond these extreme conceptions of culture as either everything human or as only that which calls itself culture to conceive of culture as a system of symbols and meanings and their associated social practices. This formulation of culture treats as inseparable signs and performances, meanings, and actions. It highlights by abstracting "the meaningful aspect of human action out of the flow of concrete interactions … [by disentangling], for the purpose of analysis, the semiotic influences on action from the other sorts of influences – demographic, geographical, biological, technological, economic, and so on – that they are necessarily mixed with in any concrete sequence of behavior"(Sewell, 2005: p. 160). This attention to linguistic and symbolic aspects of social action derives from work in anthropology (Levi-Strauss, 1963; Schneider, 1976; Turner, 1969; Geertz, 1973), but rejects any notion that culture is uniform, static, or ubiquitously shared that may have been suggested in those works. Moreover, this conception of culture goes beyond a focus on language alone.

By drawing from sociological theories of action and practice (Bourdieu, 1977, 1990; Giddens, 1984), culture is conceived as an arena or field of practical activity, competition, and struggle. Culture is not only a system of signs but is performed daily in all social interactions and settings. Swidler's (1986) formulation of culture as a 'repertoire' of 'strategies of action' is widely adopted as a succinct formulation of this conception. Here, culture is not a coherent, logical, and autonomous system of symbols but a diverse collection of semiotic resources that are deployed in the performance of action. Variation and conflict concerning the meaning and use of these symbols and resources is likely and expected. Although many of these

cultural resources are discrete, local, and intended for specific purposes, nonetheless, it is possible to observe patterns so that we are able to speak of a culture or cultural system.

"System and practice are complementary concepts: each presupposes the other … The employment of a symbol," Sewell (2005: p. 164) writes, "can be expected to accomplish a particular goal only because symbols have more or less determinate meanings – meanings specified by their systematically structured relations to other symbols. Hence practice implies a system. But it is equally true that the system has no existence apart from the succession of practices that instantiate, reproduce, or – most interestingly – transform it. Hence a system implies practice. System and practice constitute an indissoluble duality or dialectic: the important theoretical question is thus not whether culture should be conceptualized as practice or as a system of symbols and meanings, but how to conceptualize the articulation of system and practice."

The Concept of Legal Culture Introduced and Debated

Writing in 1975, Lawrence Friedman introduced the concept *legal* culture as a means of emphasizing the fact that law was best understood and described as a system, a product of social forces and itself a conduit of those same forces. Although law was, and is, commonly understood as "a set of rules or norms, written or unwritten, about right and wrong behavior, duties and rights," (1975: p. 2) according to Friedman, this conventional notion attributed too much independence and efficacy to the law on the books and acknowledged too little the power and predictability of law in action. To advance a social scientific study of law in action, Friedman adopted the model of a system – a set of structures that process inputs (demands and resources) from an environment to which it sends its outputs (functions) in an ongoing recursive feedback loop (e.g., *see* Luhmann, Niklas (1927–98)). He identified three central components of the legal system: (1) the social and legal forces that, in some way, press in and make 'the law'; (2) 'the law' itself – structures and rules; and (3) the impact of law on behavior in the outside world. "Where the law comes from and what it accomplishes – the first and third terms – are essentially the *social* study of law," he wrote (Friedman, 1975: p. 3). This relatively simple image spawned a robust scholarly community, in part because of the nuance and complexity left unsaid.

Although the social scientific study of law was, with minor but notable exceptions, marginalized in American law schools and social science departments, Friedman drew from a tradition with strong European roots. In jurisprudence, for example, Friedrich Karl von Savigny (1975[1831]), a nineteenth-century German statesman and jurist had described law as one of the most important expressions of the 'spirit of a people' (Volksgeist), a continuous thread in an evolving culture. Oliver Wendell Holmes (1881), the American judge and jurist writing from a very different, distinctly realist and pragmatic rather than romantic perspective, expressed a similar conviction that the law was a great anthropological document. Such notions of the cultural character and significance of law challenged positivist jurisprudence that defined law as an autonomous system of officially sanctioned and logically derived rules and procedures (e.g., *see* Legal Positivism).

Classical works of European sociology also placed law at the center of social life rather than at the margins. Emile Durkheim (1933[1902]), for example, argued that law had become an embodiment of the 'collective conscience' in societies with advanced divisions of labor, where interdependence and reciprocity prevailed. For Durkheim, "law is the example par excellence of the social fact. It is a visible symbol of all that is essentially social" (Hunt, 1978: p. 65). For Weber, modernity was characterized by the rise of formal legal and logical rationality and bureaucratic administration. This modern movement toward formal legal rationality generated tensions and contradictions, according to Weber (1947, 1954) between demands for predictability and equally valued demands for substantive justice. Both Durkheim and Weber offered similar analyses of the forms and functions of law as both expressions of broader social formations, in particular the transformations toward modernity, and as channels for developing social sensibilities, interests, and actions (*see* Durkheim, Émile (1858–1917); Weber, Max (1864–1920)).

Friedman chose the phrase legal culture to name the "social forces … constantly at work on the law," "those parts of general culture – customs, opinions, ways of doing and thinking – that bend social forces toward or away from the law" (1975: p. 15). As an analytic term, legal culture emphasized the role of taken-for-granted and familiar actions that operated on and within the interactions of the legal system and its environment. As a descriptive term, it identified a number of related phenomena: public knowledge of and attitudes toward the legal system as well as patterns of behavior with respect to the legal system. These included judgments about the law's fairness, legitimacy, and utility. To the extent that patterns of attitudes and behaviors are discernible within a population and vary from one group or state to another, it was possible, he said, to speak of the legal culture(s) of groups, organizations, or states (1975: p. 194). As an example of variations within legal cultures, Friedman distinguished the internal legal culture of professionals working *in* the system from the external legal culture of citizens interacting *with* the system. As the "ideas, values, expectations, and attitudes toward law and legal institutions, which some public or some part of the public holds," legal culture was meant to name a range of phenomena that would be, in principle, measurable (Friedman, 1997: p. 34). Although Friedman never elaborately theorized his concept of legal culture, reformulated it several times in different texts, and promoted it as an orienting concept rather than a set of quantifiable indicators, he remained convinced that the concept was useful as a way of "lining up a range of phenomena into one very general category" (1997: p. 33).

Following its introduction, researchers began using the concept of legal culture in a range of empirical projects including studies of children's knowledge of and attitudes to law (Tapp and Levine, 1974), rights consciousness among Americans (Scheingold, 1974), the practices of criminal courts (Nardulli et al., 1988; Eisenstein et al., 1988; but see Kritzer and Zemans, 1993), comparative analysis of different groups, and nation-states (Kidder and Hostetler, 1990; Sanders and Hamilton, 1992; Bierbrauer, 1994; Barzilai, 1997; French, 1998; Chanock, 2001). For those who attempt to measure variations in legal culture, the indicators include such diverse

phenomena as litigation rates and institutional infrastructures (Blankenburg, 1994, 1997); public opinion surveys (Hertogh, 2012); crime rates (Haley, 1978; Miyazawa, 1987), or assumptions about who should use the legal system and when.

Predictably, debates have arisen among researchers who have attempted to use the concept in empirical projects (Nelken, 1997, 2012). The most persistent divide and heated dispute seems to be among those who use culture as an analytic concept within a more developed sociological theory and those who view legal culture as concrete, measurable phenomena. Those who attempt to use the concept as a focus for comparative research more often move toward measurement and a more limited concept, although exceptions exist (Kurkchiyan, 2012). For some of these researchers, when the concept of legal culture is used with insufficient specificity, the distinction between all of culture and legal culture is unclear, and what constitutes the legal seems too often assumed and undefined (Blankenburg, 1997). Some researchers insist that legal culture is that which is produced and studied most effectively among professional legal actors, while others insist that such a narrow definition belies the theoretical utility of the concept of legal culture as a way of marking the inescapable connection between law and everyday life, just that feedback loop that Friedman posited in his notion of a legal system.

Cotterrell has produced one of the most sustained critiques of the concept (1997). He claims that "everything about law's institutions and conceptual character needs to be understood in relation to the social conditions which have given rise to it. In this sense law is indeed an expression of culture" (1984: p. 26). Nonetheless, Cotterrell is unwilling to accept a concept of legal culture that makes it indistinguishable from other forms of social control or normative ordering. Somewhere between a "thoroughgoing legal pluralism" (p. 42) in which "law can be distinguished from other social norms only in vague terms" and a too narrow, too simple conception of state law, Cotterrell seeks a middle ground that recognizes the cultural influences on and from law but yet retains a recognition of the distinctiveness of legal forms and doctrines. He urges a notion of legal ideology as an alternative concept that emphasizes the essential connection to legal doctrine, although this too is actively debated by other legal scholars (Nelken, 1997, 2012; Friedman, 1997). Silbey (2012) illustrates the utility of the concept of legal culture, and its association with formal legal materials rather than simply common social norms through a close reading of a particular urban practice: placing space holders in shoveled out parking spots on snowy city streets. This practice is performed and understood by city dwellers only because it draws upon and is debated within widely circulating interpretations of historic and contemporary concepts found in legal doctrine.

To some extent, the debates among socio-legal scholars reproduce the controversies among anthropologists and sociologists concerning the concept of culture generally. The most important issues are less empirical than theoretical because the measurement problems that fuel debate derive from the theoretical arguments: how is legal culture evident and measurable and yet diffuse and abstract; what is the relative importance of causal explanation as against description and interpretive understanding in producing a social scientific study of law; how central is formal legal doctrine in understanding participation in, support for, and consequences of law. Contemporary research on legal consciousness has dealt directly with these questions.

Legal Consciousness

If research on legal culture focuses attention on the myriad ways in which law exists within society generally, not just in formal legal institutions and the work of official legal actors, the study of legal consciousness traces the ways in which law is experienced and interpreted by specific individuals as they engage, avoid, or resist the law and legal meanings. This empirical attention to popular understandings of law reformulates some of the theoretical debates expressed in the study of legal culture.

Legal Consciousness as Epiphenomena and Structural Residues

Some scholars regard legal consciousness as a by-product of the operations of social structures rather than the formative agent in shaping structures and history. Structural anthropology, for instance, describes social actors located in complex webs of patterned social relationships that determine their perceptions and actions. Similarly, some Marxist structuralism treats ideas, including cultural symbols and narratives, as a superstructural residue of material conditions that serve the interests of elites. Following this perspective, legal consciousness is an epiphenomenon because a particular social and economic structure is understood to produce a corresponding legal order with appropriately determined legal subjects.

In most structural accounts, individuals seem to lack agency, portrayed as the bearers rather than authors of social relations. Work in this tradition often describes how the needs of capitalist production and reproduction mold legal behavior and consciousness. Studies focus on the production and practice of law, its accommodation to class interests, and the inequities that result. Some research from this structural perspective complicates the proposed relationship between law and structure by suggesting that the legal order develops in response to conflicts and inconsistencies generated by the capitalist mode of production rather than as a direct instrument of particular class interests. "To legitimize the inconsistencies and irrationalities born of the contradictions of the economy, the legal order constitutes myths, creates institutions of repression, and tries to harmonize exploitation with freedom, expropriation with choice, inherently unequal contractual agreements with an ideology of free will" (Chambliss and Seidman, 1982: p. 70).

An alternative view within the structural tradition looks at legal consciousness as one of the ways in which organizations and institutions produce the means of authorizing, sustaining, and reproducing themselves. By focusing on the legitimating functions of law, research describes the ways in which law helps people see their worlds, private and public, as both natural and right. Balbus (1973), for example, argues that certain features of liberal law, such as the highly prized claims to formal equality and what will be described below as procedural justice, serve to buttress and legitimate the

inequality of the existing economic order. The formal equality instantiated in due process rights provides "a stable and apparently neutral framework from which bourgeois class interests in accumulation and profit maximization can flourish" because due process and formal equality help convince "the 'propertyless' that they have the legal right and, hence, the real opportunity of rising into the bourgeoisie" (Balbus, 1973: p. 6). Some of this literature has focused on 'false consciousness,' or the inability of subjects, especially less educated members of the working class, to perceive their true interests or recognize opposing interests. This body of research harkens back to the contradictions in modern law, mentioned above and identified by Weber, Durkheim, and Marx. With subtle variations, these structural accounts cast law and legal consciousness as products rather than producers of social relations (e.g., *see* Structuralism; Marxist Theory in Law).

However, there are some structural and Marxist theorists who do not treat cultural symbols as superstructural residues and persons without agency. Althusser (1971), for example, suggested that cultural symbols, or ideologies, are themselves material practices and are relatively autonomous; hence culture and ideology are more than just residues. In this framework, the distinction between structure and consciousness is overdrawn. Rather than by-products of material practices, culture and consciousness actively participate in the production of material practices and social realities. During the past three or four decades, a burgeoning community of scholars working within the structural tradition "have carved out a conception of culture as a realm of creativity that escapes from the otherwise pervasive determination of social action by economic or social structures" (Sewell, 2005: p. 159). E.P. Thompson's account of the creation and enforcement of the 1723 Black Act introducing capital punishments for a variety of offenses in which feudal tenants and propertyless classes challenged the closing of English common lands, *Whigs and Hunters*, depicts the rule of law emerging from bitter struggles over access to hunting, contested common rights, as well as high crime and espionage. Rather than a simple mask for the rule of a particular class, Thompson describes the law emerging from the active struggles between the opposing sides. [It is not] "to say that the rulers had need of law, in order to oppress the ruled, while those who were ruled had need of none. What was often at issue was not property, supported by law, against no-property; it was alternative definitions of property-rights: for the landowner, enclosure – for the cottager, common rights; for the forest officialdom, 'preserved grounds' for the deer; for the foresters, the right to take turfs. For as long as it remained possible, the ruled – if they could find a purse and a lawyer – would actually fight for their rights by means of law; occasionally the copyholders, resting upon the precedents of sixteenth century law, could actually win a case. When it ceased to be possible to continue to fight at law, men still felt a sense of legal wrong: the propertied had obtained their power by illegitimate means" (Thompson, 1975: p. 261).

Legal Consciousness as Individual Attitudes and Opinions

In another common formulation, the role of individual agency is centrally assumed, if not always explicitly articulated and theorized. Here, scholars conceptualize consciousness as the ideas and attitudes of individuals that, when taken together, determine the form and texture of social life. For the most part, these studies are not distinctly different from studies of legal culture relying on surveys of individual attitudes, opinions, and actions. A legacy of the liberal tradition in political and legal theory, this conception of consciousness (and culture) suggests that social groups of all sizes and types (e.g., families, peer groups, corporations, and communities) emerge out of the aggregated actions of individuals but do not specify the mechanisms (processes or structures) of aggregation. According to this approach, sometimes referred to as methodological individualism, "political society is … an association of self determining individuals who concert their will and collect their power in the state for mutually self-interested ends" (Wolff, 1969: p. 5). Here, individual consciousness consists of both reason and desire. According to liberal ideology, desire, which also remains unexplained for the most part, is "the moving, active, or primary part of the self … What distinguishes men [sic] from one another is not that they understand the world differently, but that they desire different things, even when they share the same understanding" (Unger 1981[1975]: pp. 39,40). In common parlance, this is often referred to as expressions of different values, or in economics utilities, those values assumed to be innate differences, nature not nurture.

Relying on this attitudinal conception of legal consciousness, researchers have attempted to document the variation in beliefs, attitudes, and actions of individuals as a means of explaining the shape of legal institutions and practices, assessing the degree to which the rule of law is part of the socialization and habits of a population (Stalans and Kinsey, 1994), and predicting the emergence of stable liberal legal regimes within states undergoing transitions from authoritarian or colonial rule (e.g., Gibson and Gouws, 1997). Lind and Tyler (1988), for example, have documented Americans' attachment to ideas of fairness and due process and to what they call procedural justice (cf Thibaut and Walker, 1975). The research suggests that people commonly evaluate their legal experiences in terms of the processes and forms of interaction rather than the outcomes of those interactions. Attitudes about the law correlate strongly with judgments about the fairness of the procedures used by legal authorities rather than with substantive principles, winning or losing in that process. Lind and Tyler describe deep, broad-based normative consensus among Americans (e.g., *see* Compliance and Legal Authority).

In contrast, a study of legal attitudes among Europeans observes considerable variability in citizens' commitments to, and alienation from, law and legal values rather than consensus (Gibson and Caldeira, 1997). For example, respondents in Greece report high alienation from legal institutions, limited support for the rule of law, and a slight tendency to value order over liberty, while Danish respondents report very low alienation and strong support for liberty and the rule of law. Although Gibson and Caldeira find international variation among the European states, they also find strong variation within nation-states. Studies in nations transitioning from communist or other forms of authoritarian rule to democracy also report notable intra-nation as well as international variation, some of which is attributed to different stages of cognitive development, variations in past experience

and familiarity with legal processes, and generally with national cultures and styles (Kourilsky-Augeven, 1997).

Constitutive Theories of Legal Culture and Consciousness

Constitutive analyses work to resolve the debates concerning determinism, structure, and agency in studies of culture and legal consciousness. Research from a constitutive perspective emphasizes the role of consciousness or cultural practice as communicating factors between individual agency and social structure rather than expressions of one or the other. Defining legal consciousness as participation in the processes of social construction, research has focused on the ways in which local concrete action accumulates into systemic institutions and structures (Ewick and Silbey, 1998). In other words, research adopting a constitutive perspective works to show how the signs, symbols, and invocations relating to law form a mutually reinforcing system so that the articulated opinions or interpretations make sense to speakers and audience by reference to commonly circulating meanings and relations to other signs – the system or structure of culture. Similarly, the legal culture or system of signs does not exist independently of these individual invocations and articulated opinions and performed actions. "In legal consciousness research, the push and pull of legal ideas lie at the heart of modern explanations of the texture of law in our everyday existence. On one side is the pull of law in constructing and constraining individual action and decisions. The law imposes constraints in the form of elaborate regulations, codes … On the other side, individuals' own interpretations of law provide the push, shaping the new versions of legality. In this approach, law is not passive, but rather a dynamic force. By enacting legality in daily life, ordinary people give flesh and meaning to what is otherwise an 'abstract but binding form'" (Marshall and Barclay, 2003: pp. 617–618, citing Habermas, 1996: p. 318). "By inviting legal scholarship to focus on everyday life, rather than on legal doctrine," scholars "seek to bring into view, if not give primacy to, the lively normative resources of the everyday. These, no doubt, are resources powerfully shaped by law; but they are also resources on which law itself deeply depends" (Sarat and Kearns, 1993: p. 56).

Working within a Gramscian framework (e.g., *see* Gramsci, Antonio), these analysts describe how the taken-for-granted aspects of social relations, including the legal aspects, are produced, enacted, and reproduced. They document situations in which local processes recursively reproduce macro social structures and institutions and, at the same time, provide openings for creativity in reshaping those structures (e.g., Hebdige, 1979; Hall and Jefferson, 1975). In particular these constitutive/cultural analyses of legal consciousness describe the processes by which law contributes to the articulation of meanings and values in daily life (Henry, 1983). Attention is directed to the local contests over signification within diverse and competing discourses that take place in most aspects of ordinary life including families (Merry, 1990; Yngvesson, 1993), religious communities (Greenhouse, 1986), medical care (Heimer, 1999), engineering (Espeland, 1998), gender, race, or age discrimination (Bumiller, 1988), managing handicapped identities (Engel, 1991; Engel and Munger, 2003), or poverty and public welfare (Sarat, 1990; Munger, 1999) (e.g., *see* Law and Everyday Life). In these analyses, researchers observe both the orchestration of the local contest and the systematic outcome, in this way mediating micro and macro perspectives and identifying the mechanisms for aggregating individual actions and preferences. Within this framework, consciousness is understood to be part of a reciprocal process in which the meanings given by individuals to their world become patterned, stabilized, and objectified. These meanings, once institutionalized, become part of the material and discursive systems that limit and constrain future meaning-making. In this constitutive conception of legal consciousness, law does more than reflect or encode what is otherwise normatively constructed. Law enables, as well as constrains the possibilities of social interaction. "The commonplace operation of law in daily life makes us all legal agents insofar as we actively make law, even when no legal agent is involved" (Ewick and Silbey, 1998: p. 20).

In one study, Conley and O'Barr observed litigants in small claims courts to determine how ordinary "people identify and analyze legal problems, how they decide when and in what form to bring a problem to the legal system, and how they respond to the demands that the system makes of them" (1990: p. ix). The authors observed two distinct discursive styles. One style is rule oriented, adopted primarily by experienced players who see law as system for assessing and distributing responsibility; this style is valued by the judges and court personnel. The second style focuses on and emphasizes relationships, sequences of events, and the temporal unfolding of a narrative; this style is preferred by minority and group litigants as well as women and poorer citizens. Although having one's day in court is an American ritual, highly prized as an essential human right, many citizens end up frustrated, the researchers claim, because legal authorities prefer and often demand something other than a heart-rending narration of pain or an impassioned moral claim.

In a study of the legal consciousness of ordinary Americans, Ewick and Silbey (1998) synthesize diverse results of earlier studies with new data. They construct three accounts of law that encompass the range of cultural materials with which people produce and experience legality as a structure of social action. Drawing upon different cultural images (e.g., a bureaucracy, a game, pragmatic coping strategies such as 'making do'), each story describes a familiar way of acting and thinking with respect to the law. The stories incorporate alternative normative bases for legal authority, varying constraints that define action as legal, varying resources for legal capacities, and varying temporal and spatial locations for law. In one account, the law is remote, impartial, and objective, something to be invoked for solemn and collective purposes that transcend the messiness and partiality of individual lives. The law itself resides in times and spaces separate from everyday places and, while enacted by legal functionaries, exists apart from the words or deeds of particular persons. In a second account, legality is understood to be a game of skill, resource, and negotiation where persons can legitimately seek their own interests against others. Law in this rendering appears as a defined arena for strategic interactions, sometimes

engaged playfully and sometimes with dead seriousness, but always simultaneously alongside and within everyday life. A third story describes the law as an arbitrary power against which people feel virtually incapacitated. Often the only way to deflect legal power is to employ various subterfuges and evasions. These minor forms of resistance typically leave the law unchallenged and unchanged. Their employment and effectiveness is premised, however, upon a potentially subversive recognition of the structure and organization of legality in everyday life.

Ewick and Silbey demonstrate the connection between the micro phenomenon of legal consciousness and the macro institutions of law by showing how the multiple forms of legal consciousness expressed in the three stories of law, together as an ensemble, sustain legality as a durable structure of social action. Although the dual depictions of law as God-like (remote, transcendent, objective and magisterial) and game-like (legitimate, rule-bound, and resource-dependent pursuit of self-interest) seem to challenge one another, they are actually complementary. Although each view emphasizes different normative values and provides a different account of the social organization of law, as an ensemble they cover the range of conventional experiences of legality. Any particular experience can find expression within the heterogeneity of the whole. The law is neither rendered irrelevant for everyday life (by virtue of being remote) nor subsumed by it (by virtue of being familiar).

The schemas Ewick and Silbey identified organized the varieties of legal consciousness that had been described in other research. They confirmed the observations of deep normative consensus with regard to norms of procedural fairness (e.g., Lind and Tyler, 1988) while also observing tactical, sometimes cynical, sometimes earnest, employment of law's devices for a variety of personal or organizational interests that so much of the literature describes. They also documented the resistance to legal processes that Bumiller (1988), Greenhouse (1986), Sarat (1990), had been describing in a wide range of social fields and actions. The combination of extensive data collection (for generalizability) with intensive conversations (for rich textual accounts) was able to reproduce many of the results of the existing literature, at the same time developing a theoretical synthesis. More recent studies have challenged some of the methods (Garcia-Villegas, 2003), but have also confirmed the description of legality as multiply stranded cultural schemas (Cowan, 2004; Fleury-Steiner, 2003, 2004; Hoffman, 2003; Hull, 2003; Kostiner, 2003; Marshall, 2003, 2005; Nielsen, 2000, 2004; Pelisse, 2004; Quinn, 2000; Sagay, 2003; Steiner, 2001).

These constitutive studies reject the dualisms in recurrent debates about the relative roles of structure and agency in shaping the world and focus instead on the role of consciousness (participation in social interaction) in (re) producing the social world (e.g., *see* Law as Constitutive). Moreover, these constitutive analyses of culture and consciousness specify how myriad discrete actions accumulate into institutional forms through processes of reification in which the contingent human production of social life is effaced by attending to its continuous, durable features. This attention to systematic aspects makes the social interactions and practices appear to be independent of just that human action of which it is composed. Thus, studies of legal culture and consciousness try to emphasize the daily, locally repeated enactment or practice of social structure. Some cultural accounts, however, go so far as to reject explicitly any distinction between structure and agency, insisting that the analytic distinction itself contributes to the ongoing processes of reification constituting social reality. Finally, in these constitutive studies of legal culture and consciousness, law is understood to be part of a complex totality in which "it constitutes as well is constituted, shapes as well as is shaped" (Kairys, 1982: p. 5).

Recent Advances in Research on Legal Consciousness

Contemporary studies of legal consciousness trace the understandings of law that circulate through social relations attempting to show how consciousness is "shaped by class, education, geography, and occupational position" (Cooper, 1995: p. 510). Researchers attempt to map the variations in legal consciousness by associating distinct interpretations and actions with different sociological and demographic markers or organizational locations. The legal consciousness of people who share social characteristics of identity or experience is expected to influence their interpretations of institutions and processes including the law (Marshall and Barclay, 2003, Nielsen, 2004; Engel and Munger, 2003). Almost all the research describes the double bind of experiencing constraints in the attempt to enact human agency; the studies specifically emphasize the frustrations and contradictions of empowering oneself by deploying the law's powers. Although dozens of studies confirm that the legal consciousness of ordinary citizens is not a unitary phenomenon, few studies have been able to produce compelling associations between legal consciousness and "particular types of laws, particular social hierarchies, and the experiences of different groups with the law" (Nielsen, 2000: pp. 1055, 1086). Silbey (2005) identifies the limits of the research agenda in misunderstandings of contemporary popular cultural production, an overreliance on surface indicators, and a confusion between theoretical concepts and empirical indicators.

Research seeking to capture the authentic voices of ordinary people belies the suffusion of everyday life by professional, marketed cultural production. Poll results have become a form of politically manipulated cultural representation; rather than a snapshot of the public at any moment in time, public opinion polling has become a means of representing the public (to the public) as supportive of the interests and policies of particular elites. Importantly, because legal culture and consciousness were developed as concepts to analyze the law without using the law's own assumptions and language, we need to recognize that the ability to seduce the public through mediated messages has been a direct product of social scientific knowledge about human desire and cognition. In the effort to construct an account of the ways in which law suffuses and perhaps dominates everyday life, it would be foolish to deny real, experiential, material differences in social spaces and lives, extraordinary variations in life expectations and conditions. Nonetheless, the use of the concepts of legal culture and consciousness are used by scholars not to document whether the conditions of our lives

vary, but whether the cultural terms with which we understand and communicate, and with which we constitute our lives, can be correlated with legal concepts and doctrines, as well as social locations.

Legal Education

Abstract

This article examines a specific form of education designed to serve both professional formation and liberal education, namely legal education. There are five sections: the first section discusses the origin and historical evolution of legal education; the next section describes the unique goals of legal education and competing interests of different stakeholders; the subsequent section presents an analysis of formative influences and drivers of change common to modern legal professions; this is followed by a section on educational continuum covering an explanation of the different phases of legal education; and the article concludes with the latest developments and influences shaping the future, namely managerialism, audit, diversity, and access.

Legal education, in any systematic sense, is a relatively new phenomenon in most jurisdictions. In ancient Greece and Rome there was some formal training in advocacy (moral and legal) supporting the establishment of a professional class of person with legal expertise but this class was not a profession as such, and early forms of legal education were delivered primarily through observation and training acquired by serving as an apprentice to a legal consultant (*jurisprudent*) rather than through formal academic study. Legal texts were for many centuries quite rare that meant that the art of rhetoric inevitably formed the 'core' of early legal education. Gradually, however, as texts on both law and custom became more common, and records started to be kept of court decisions, this dominant oral tradition was supplanted with a new written tradition created by full-time law teachers dedicated to establishing and communicating a literature on, about, and for law. Whether this literature was written to serve the goals of the academy or of the professional bodies has never been clear and to the present day the ultimate goals of legal education have been strongly contested by its various stakeholders.

The Establishment of Organized Legal Education

Legal education may have started out in classical times by asking universal questions linking legal rules, morals, and justice and only much later were these elements separated, with some discarded altogether. Very early legalists in the ancient world were certainly not parochial in their outlook and did not draw sharp distinctions between law and morality, nor did they fail to consider the relationship with other professions and disciplines. If one draws a distinction between legal *education* and *training* it could be said that with the passage of time the latter has steadily displaced the former with the result that, until recently, the boundaries of legal thought have been shrinking and the legal mind has become more introverted and absorbed with technical ephemeral rules rather than fundamental values. Roman law, canon law, and international law – the *ius commune* – was the focal point of legal study in the medieval universities on the continent of Europe and these legal sources formed the basis of a common transnational legal language facilitating trade between commercial classes. The English common law was an exception to this trend and although to some extent influenced by this *ius commune*, its impact in England was greatly reduced by the early development of an indigenous and sophisticated legal culture relatively insulated from Roman law.

The subsequent focus on national legal systems correlates with the rise of nation-states and liberal legal professions. Legal education in medieval England was provided by the Inns of Court that organized highly vocational apprenticeships involving both shadowing practitioners and practical exercises – and of course dining – within a closed, and almost monastic, community (Brand, 1999; Baker, 1990). The historic impetus for legal education therefore came from a divided profession that bequeathed a persistent legacy differentiating English legal education from university-based legal education found elsewhere. With the advent of printing, legal texts started to supplant, but not replace, these informal methods of socialization. University education in English law did not commence until Sir William Blackstone started to give his famous lectures at Oxford in the 1750s, but these were not so much for fledgling lawyers following a degree course as stand-alone lectures for would-be justices of the peace and gentlemen. It was not until the nineteenth century, with pioneers such as John Austin, Jeremy Bentham, and Sir Henry Maine, that university legal education was established at University College London and beyond, including the Council of Legal Education that was set up in 1852 (see Cocks, 1983, 1988). The Society of Legal Scholars, along with other bodies, further promoted the resources and status of law teaching and law teachers throughout the twentieth century in the United Kingdom and Ireland (Cownie and Cocks, 2009), while in the United States legal education is generally seen to have begun with the foundation of Harvard Law School in 1817, with subsequent development assisted and monitored by the Association of American Law Schools (Sutherland, 1967; Stevens, 1983). In England a golden age in which legal scholarship seriously engaged with larger issues of politics, policy, history, and society, such as found north of the border with the Scottish Enlightenment, had to wait for the great reformer Jeremy Bentham and, a century later, a scholarly and US-influenced 'renaissance' – associated with interdisciplinary movements such as law and society, critical legal studies, feminist legal studies – that ultimately claimed victory with the contested assertion "we are all realists and contextualists now" (Sugarman, 2011). At the

start of the twenty-first century, aided by the Internet and occupying virtual space, new supranational associations have emerged alongside more established regional bodies such as the Australasian Law Teachers Association (1977) and the European Law Faculties Association (1995): today the International Association of Law Schools (2005) and the International Association of Legal Ethics (2010) also promote legal education and scholarship across regional and global stages and over time could supersede the role of national bodies that to date have concentrated on more parochial interests of academic lawyers and practitioners. It is possible, following these latest institutional initiatives, we shall witness a return to the original, more universal questions that prevailed at the inception of legal education.

The Aims of Legal Education

Toward the close of the last century, several national reviews of legal education were set up to report on the state of legal education (Ormrod, 1971; Arthurs, 1984; Pearce, 1987; MacCrate, 1992; Franken, 1995; ACLEC, 1996). From these national reviews it is apparent that throughout the world legal education has increasingly diverse aims serving concurrently both academic and professional goals (Cownie, 2010). The precise mix balancing scholarship and practice varies between, and within, particular jurisdictions. And even within particular law schools heated debates about theory, substance, and method are found. Scholarly approaches have become pluralistic and fall into a number of subcategories: doctrinal ('black letter'); sociolegal; contextual; critical; jurisprudential; interdisciplinary ('law and …'); comparative; clinical; and skills oriented (see Twining, 1994). At the most general level almost all would agree that legal education should introduce students to what it means to "think like a lawyer" (Ormrod, 1971, p. 102). Law is an intellectual discipline with distinctive concepts, institutions, and methods of reasoning, and a primary responsibility of all law schools is to create, develop, and transmit this 'core' knowledge. In England and Wales, as elsewhere, the professional bodies take an active interest in defining this core but their involvement is often resented, or resisted, by the academy that asserts jurisdiction over the academic or 'initial' stage (see Section The 'Initial' Stage). The ACLEC Report sought to balance the interests of various stakeholders by concentrating on articulating an 'outcome statement' which specified the broad skills, knowledge, and values law students should possess by the time they graduate without dictating to law teachers precisely how their students should be taught (ACLEC, 1996, p. 72). Debates over the 'core' continue (e.g., Bradney, 2003) and a major evidence-based review of legal education and training requirements is currently under way in England and Wales, sponsored by the professional bodies but carried out by academics, and due to report in December 2012. This latest review aims "to ensure that the future system of legal education and training will be effective and efficient in preparing legal service providers to meet the needs of consumers" (LETR, 2012).

Interdisciplinary approaches, initially outside or on the periphery of the curriculum, have become increasingly part of the mainstream but the risk now is that of curriculum overload and superficial learning. Anglo-American legal education has embraced 'sociolegal studies' and the study of 'law and society,' but law schools in continental Europe have for a long time made nonlaw subjects, such as legal history, economics, philosophy, or sociology, compulsory for undergraduate law students. In the civil law, world legal education continues to be dominated by the study of codes that can be traced back to Roman law. Codes provide the focal point for formal instruction that tends to discourage or displace critical reflection but also within the common law systems doctrinal analysis still prevails although it is now generally accepted that law students should also be exposed to ideas about the context of law. Australia and New Zealand adopt yet another model which involves the majority of law students enrolling on 'double degrees' that provide more than a 'taste' of other disciplines; they actually ground law students in a wide range of other academic disciplines so that by the time of graduation they can think not only 'like a lawyer' but are skilled in, rather than knowledgeable about, reasoning associated with other sciences and humanities.

By the time of their graduation, law students are expected to have laid the foundation for a law-related career but not necessarily one within the legal profession. Although many, if no longer a majority of, law students in England and Wales still aspire to qualify as either a solicitor or barrister, this has never been true in continental Europe, the United States, or Japan where the emphasis has always been on producing lawyers who will disperse into a range of occupations in the public and private sectors both inside and outside the legal profession. Increasingly it is being recognized that law schools not only prepare students for a career in law but rather they enable people who can handle legal sources to cope with change in a wide variety of work environments which could be described as the 'legal services industry.' 'Globalization,' new regulatory frameworks and technology, and interdisciplinary tendencies common to all modern professions are transforming this industry (Flood, 2011). Legal education continues to teach students how to 'think like a lawyer,' but today this thinking requires much more than a passive understanding of primary sources, principles, and concepts and must include a critical awareness of what is happening outside the world of law. Because so much law has a built-in obsolescence, it is vital that law students possess the skills and confidence to interpret new rules and situations (Economides and Smallcombe, 1991, p. 23). University legal education must therefore, inter alia, provide a solid foundation for training at the vocational stage, and what happens subsequently during continuing professional development as well as a wider contextual framework for understanding the uncertainty that lies ahead.

Trends in Legal Education

In demographic terms university legal education has been steadily expanding in most jurisdictions after the Second World War creating a mismatch between the supply of law graduates and their demand from prospective employers, at least those from within the legal profession. Most lawyers today are middle-class university graduates although they are not

necessarily law graduates, male, or white. Methods of delivering legal education are constantly evolving but a university degree, which acts as a qualifying examination recognized by the profession, has replaced apprenticeship that for centuries was the normal entry route to a legal career. Women have become increasingly visible in law schools and the profession, and this numerical presence is also challenging traditional male-dominated attitudes toward both the law and legal work. Within common law jurisdictions it is possible to enter the profession having studied another degree, and indeed some law firms express a clear preference for those with nonlaw or mixed degrees (Economides, 1999, p. 400). The professions have always sought to control entry, partly to maintain standards and protect what they see as a finite amount of legal work that can be shared (Abel, 1999). On the other hand, because universities (and to some extent government policy on higher education) decide who enters law school – and in most countries these have been expanding in both size and number – law students continue to flood the market. In Japan, which produces over 40 000 law graduates a year, recent reforms have increased the total number of places on the professional training course to still only around 1000 places. What some may describe as the overproduction of law graduates who fail to gain full professional qualifications has also brought about new forms of legal service delivery through so-called 'paralegals,' while at the same time encouraging experimentation with new access policies opening up entry to mature students and those from poorer backgrounds and ethnic minorities.

The increase in the numbers of those entering law school has not always been matched by a corresponding increase in resources resulting in adverse staff–student ratios or an imbalance in the social and ethnic composition of the law student population. In order to cope with this expansion in numbers, new teaching methods have evolved whereby students participate in more independent, active learning and teachers are under continual pressure to explore the potential of computer-assisted learning (CAL). Distance learning in legal education remains uncommon, although is not unknown, and could have significant implications not only for citizens' access to legal education but also for citizens' access to legal services more generally. The use of simulated learning environments, particularly at the vocational stage, is also spreading and these new forms of pedagogy hold considerable potential when it comes to introducing future lawyers to the risks and realities of legal practice. Progress with the notion of "Community legal education" (Cooper and Trubek, 1997, p. 233) could be accelerated with increasing access to the Internet and the development of expert systems in law which threaten the power base of the legal profession and its exclusive control over legal knowledge and expertise (Susskind, 1998, 2008).

Law schools tend to deploy a variety of methods to deliver teaching and national traditions and available resources determine these. Perhaps as a consequence of increased communication and awareness of different approaches there is convergence resulting from the exchange of ideas and experimentation. The casebook approach pioneered by Christopher Columbus Langdell at Harvard over a century ago and the 'Socratic method' in which students explain the logic of legal argument through a question and answer session conducted in a large classroom have been exported to other common law countries. Most undergraduate law teaching is delivered through a combination of formal lectures backed up by tutorials, workshops, and/or seminars. Postgraduate legal studies are more library and seminar based. Class sizes are what distinguish the common law from the civilian legal systems, with the latter typically requiring lecturers in core subjects to perform before audiences that can reach thousands rather than mere hundreds. Common law systems select students prior to entry while in many civil law systems law students are sifted at the end of their first year. Teaching legal skills has now become an important part of the informal law curriculum in Anglo-American law schools that have moved beyond mooting (mock trials) to include client-interviewing and clinical approaches that sometimes involve advising or representing live clients (Evans, 2011). However, the fact that European Union law – the new *ius commune* – is now part of the mainstream of the curriculum means that both civilian and common law methodologies are understood by law students throughout Europe (East and West) and that European law students can observe in the jurisprudence of courts in Luxembourg and Strasbourg the synthesis of these hitherto contrasting legal methodologies.

A further recent trend in legal education common to many modern law schools concerns the revival of interest in the ethics and morality of law. In the United States, the Watergate scandal led to compulsory courses in law schools in professional responsibility while in many continental legal systems 'deontology' is taught but usually in a highly formal uncritical manner which does not depart far from the code of professional conduct. For most of the past two centuries positivism has prevailed in the teaching of law with law students being taught to focus almost exclusively on studying legal rules divorced from their moral, political, or social context. Contextual and critical tendencies in legal scholarship challenged legal formalism since the 1970s, but more recently there have been attempts to (re)introduce into the undergraduate curriculum ethical perspectives in order to enrich and deepen the education of law students (Economides, 1998; Boon, 2010). By exposing law students to ethics and values, the aim is to promote a more responsible and less cynical approach to both legal study and practice and instill a sense of professionalism (Sullivan et al., 2007). Evidence from several jurisdictions in both the common law and civilian legal systems suggests that the modern law school inculcates egotistical cynicism rather than an altruistic sense of public duty or any strong commitment to justice (Cooper and Trubek, 1997, 1999; Economides, 1998, 1999; Junqueira, 1999; Erlanger et al., 1996; Granfield, 1992). The need to strengthen the teaching of legal ethics arises not only at the initial stage of legal education but is also necessary at other stages of the educational continuum (Economides and Rogers, 2009).

The Educational Continuum

Legal education should be seen as part of 'lifelong learning' and need not be confined to what happens inside law schools or preparation for legal practice. The term 'law-related education' (LRE) usually refers to legal education in schools as

opposed to 'public legal education' (PLE) for adults, outside of school (Cassidy, 2000; Plenet). The fact that law schools are expected to deliver lawyers ready for practice at or soon after graduation, often, results in narrow, cramped, and overcrowded curricula with an unhealthy obsession with examination grades. This obsession with grades (which determine entry and status within the job market) arguably undermines the educational experience at any given point along the educational continuum and substitutes competitiveness for collegiality (Thornton, 2012). It also inhibits intellectual freedom by forcing the law student to memorize rules rather than explore ideas, with the result that legal education tends toward 'training for hierarchy' (Kennedy, 1982). While the education of lawyers clearly falls into distinct phases, it is perhaps preferable to regard the acquisition of legal skills and knowledge as part of ongoing processes that are continually refined throughout a legal career, and in this way reduce some of the pressure and expectations invested in particular *rites de passage* such as graduation and professional qualification. Ideally each stage should prepare the student for what follows next without being too prescriptive about the content or methods deployed at any particular stage.

The 'Initial' Stage

Legal education normally commences with an undergraduate degree although in some countries law may be taught in secondary schools along with instruction in civics or citizenship. In the United States most law schools require graduate entry and this is also the case in India and Pakistan. The undergraduate law degree – in which the foundations of legal knowledge are laid – is thus the normal initial or academic stage of legal education although most countries permit a measure of flexibility with regard to entry (and exit) to professional qualification. Postgraduate degrees serve to prepare for specialist areas of legal work, a career in academic law or cleanse an undistinguished first degree, and here students may follow a taught Master's course or read for a higher degree leading to an MPhil or PhD.

In the Anglo-American system, and many other countries in the common law world, students are expected to pass examinations in four or five subjects at the end of each year. It is also increasingly common for law schools themselves to be ranked according to their research and teaching quality, such rankings appearing in league tables organized and publicized by government or leading newspapers. The US News and World Report, for example, grades law schools in the United States, and in the United Kingdom the Higher Education Funding Council (HEFCE) administers the assessment of research quality through the Research Excellence Framework (REF), the results of which are fed into league tables organized by national newspapers. Examinations also feature in many continental European countries but here the university law degree invariably takes much longer, and in Germany the norm is 5 years (although this currently is under review) and concludes with a single comprehensive examination (the First State Examination) at the end of those 5 years (Korioth, 2006–07). Other European countries combine the system of yearly examinations in each course with a comprehensive examination at the end of the 5-year period of study (Lonbay, 1990, 2010a,b). One of the costs of the examination system is compartmentalized thinking in which students are unable to think across subject boundaries and for this reason it has become common to introduce general topics such as 'Public Law' and 'Private Law' which are spread over 2 years. Apart from the written examination most law schools offer students the opportunity to write a long essay or dissertation, sometimes in lieu of written examination, and continental law schools in Italy and France make use of oral examinations and a thesis to be written in the students' final year. In English law schools the *viva voce* examination is usually confined to resolving problematic or borderline results but increasing use is made of various forms of continual assessment. Students can sometimes also gain credit for working on law reviews, but this remains quite rare outside the United States.

The 'Vocational' Stage

In England and Wales, lawyers qualify as barristers or solicitors by taking either the Bar Vocational Course (BVC) or the Legal Practice Course (LPC) (see Economides and Smallcombe, 1991). Both courses have introduced a new skills element now taken at various franchised institutions including some university law schools. Simulated learning in virtual learning environments is being pioneered for vocational courses in both the United Kingdom and Australia (Maharg, 2007). Following the Courts and Legal Services Act 1990, which blurred the distinction between barristers and solicitors by allowing certain of the latter to gain higher courts rights of audience, the arguments in favor of common training for both branches have become much stronger (see ACLEC, 1996: Chapter 5; Lonbay, 2012, pp. 484–485). Currently barristers' training is focused on the four Inns of Court (Lincoln's Inn, Inner Temple, Middle Temple, and Gray's Inn) and falls under the jurisdiction of the Bar Standards Board (BSB), while solicitors' training is now governed by the Solicitors Regulation Authority (SRA), with the new Legal Services Board (LSB) overseeing the work of these frontline regulators following the Legal Services Act 2007. University graduates may obtain partial or total exemption from the first part, depending on their degrees, provided these satisfy the Joint Announcement on Qualifying Law Degrees. To qualify as a barrister, one must pass the BVC and serve a period of apprenticeship (pupilage) that involves 6 months in chambers attached to a barrister. The pupil barrister cannot practice unsupervised until she or he has been a pupil for 1 year. A major obstacle for students coming from poorer backgrounds has been finding a place in chambers but the profession has initiated reforms to try and assist the fair distribution of the limited training places that become available. In order to qualify as a solicitor one must pass the LPC and get a training contract in which one serves an apprenticeship as a trainee solicitor, normally attached to a firm of solicitors, for 2 years. Scotland and Ireland have similar arrangements although both jurisdictions have progressed farther with the notion of common training. Judicial training, which usually follows a successful career at the Bar, is now overseen by the Judicial Studies Board while employed lawyers, for example in the Crown Prosecution Service, are subject to further training in-house. Vocational legal education in recent years has been dominated by the large city firms which have invested heavily in in-house

training (and toyed with the idea of setting up their own vocational course provider), while many small firms in the provinces and rural areas, even though willing, have been unable to afford to take on trainee solicitors. Common training exists in the United States in that passing the state bar examination (which does vary) both grants admission to the Bar and qualifies one for all categories of legal work.

In civil law countries specialization takes place following graduation. In Japan, Spain, and France there are special national schools to train judges, entry to which is highly competitive and based on performance in an examination, while in Germany and Scandinavia law graduates intending to pursue a judicial career also take further vocational examinations and are then attached to a court while serving a probationary period at the end of which tenure for life is granted. Those wishing to qualify as lawyers follow training geared to particular forms of legal practice. In France, the choice is among qualifying as an advocate, an *avoué*, or a notary. In Germany, law graduates wishing to practice follow a program of practical training as a *Referenda* in diverse legal settings across the public and private sectors at the end of which they must pass the state bar examination (*Assessorexamen*) (see further Lonbay, 1990).

Continuing Professional Development

Most, if not all, modern legal professions either encourage or offer practitioners some form of post-qualification practical training in order to refresh their knowledge of substantive law while informing them of procedural and other developments that concern the business and management side of legal practice. Increasingly, however, Continuing Professional Development (CPD) is compulsory. England and Wales have led the field: the Law Society was the first to introduce mandatory CPD in 1985 and the Bar followed in 1997 (see ACLEC, 1997). In the United States CPD, there known as Continuing Legal Education (CLE), is now mandatory in the vast majority of states with some, for example, New York and Washington State, going further to require ethics as a subset of overall CLE credits earned within a reporting period (American Bar Association, 2012). Similarly in Australia, all states now require general mandatory CPD, with some such as Victoria and Queensland establishing a CPD core that must include ethics, advocacy, or practice management. New Zealand is following suit by making CPD mandatory from 2012. Over the past decade, continental Europe has also been coming on board steadily with 18 European countries now requiring CPD (CCBE, 2011). All 13 of the remaining European states that are yet to implement a mandatory regime offer various continuing training opportunities organized through professional associations, with Austria, Cyprus, Hungary, Latvia, and Malta all actively contemplating introducing mandatory CPD.

The Future of Legal Education

Future trends are difficult to discern, but it seems probable that legal education will become more international and virtual in character with law libraries possibly disappearing altogether as technology and online legal resources are more common, not only among law students but also members of the wider public. Law schools, as with legal professions, are increasingly subjected to managerialism and quality audits that question the traditional ideals of a liberal legal education. Graduate attributes that embrace skills needed in the workplace are challenging if not displacing the traditional role of law schools in developing legal reasoning through communicating the art of 'thinking like a lawyer.' As legal work evolves in a rapidly changing market for legal services so also are the expectations placed upon legal education which will need to produce minds that are reflexive, flexible, and innovative. The modern law school will continue its core functions of educating lawyers and legal scholars and producing research that creates the knowledge base for this education. But increasingly, a third function – outreach – is likely to manifest itself as law schools invest in the dissemination of legal knowledge and skill that serve the wider community (Coper, 2010). In conclusion, it may be predicted that legal education will become increasingly 'common,' and in at least three distinct ways. First, within jurisdictions, following current regulatory reform of the legal services market that blurs both inter- and intraprofessional boundaries, elements of advocacy and ethics training might be shared by trainee solicitors and barristers that eventually may lead to a complete fusion of vocational training and, in England and Wales, a merger of the LPC and BVC. Secondly, at federal and transnational levels, we are likely to witness greater convergence in the structures if not substance of legal educational frameworks so that, within Europe, North America, and Australasia, common approaches and prescriptions are adopted that mean legal standards and qualifications shift from state to regional, if not global, levels. Where one has trained is no longer going to be so closely tied to where one practices law as 'common training' among like-minded jurisdictions disregards geography. Finally, if current outreach initiatives meet with any success, legal education will become far more common in the sense of 'ordinary,' no longer the exclusive preserve of a closed professional elite or the middle classes, but an ever more inclusive and empowering experience that truly serves the legal needs of ordinary citizens.

Legal Formalism

Daniel A Farber, School of Law, University of California, Berkeley, CA, USA

This article is a revision of the previous edition article by D. Kennedy, volume 13, pp. 8634–8638, © 2001, Elsevier Ltd.

Abstract

Legal formalists seek certainty and clarity in law. Formalism can take several jurisprudential forms: a preference for bright-line rules over more flexible legal standards, belief that legal decisions never require recourse to nonlegal materials, or belief that every legal decision has a single right answer. In the United States, formalism was a dominant view between the Civil War and the New Deal, but then disappeared until the 1980s, when it reemerged in the hands of conservative jurists advocating originalism in constitutional law and textualism in statutory interpretation.

Legal formalism is a familiar idea to lawyers, judges, and legal historians. Yet providing a rigorous definition of legal formalism is difficult, and on examination it turns out to have several different dimensions. If nothing else, the term connotes an effort to reduce or eliminate the role of policy judgments in judicial decision making, but this effort can take multiple forms. The history of legal formalism in the United States also is more complex than suggested by a traditional story of post-Civil War rise and post-New Deal fall. Among other complications to this story, formalism has had a revival of sorts in recent years, particularly in the hands of conservative lawyers and judges. Although this article focuses on the robust debates over legal formalism within the United States, similar developments have occurred in other common law jurisdictions.

The author begins by considering the meaning of legal formalism. Like 'judicial activism' and 'judicial restraint,' it is a term often used for praise or condemnation, but its exact meaning can be elusive (Kennedy, 2001). Formalism remains something like the official ideology in civil code countries, but has a much more varied history in the United States (Merryman and Perez-Perdomo, 2007). The history of formalism in American law falls into two distinct periods. One period straddles the turn of the twentieth century, running from the end of post-Civil War Reconstruction in the 1870s to the New Deal in the 1930s, and the other beginning in the final quarter of the twentieth century and continuing (so far) into the first quarter of the twenty-first. These two formalist periods are discussed in separate sections below. Finally, the author considers the somewhat complex relationship between formalism, judicial behavior, and political ideology.

What Is Legal Formalism?

Legal formalism takes different forms, making the concept multidimensional (Schauer, 1988; Bix, 1999). It may focus on the utility of clear rules as opposed to more amorphous legal standards such as reasonableness. Another variant of formalism attempts to protect the authority of legal texts against efforts to broaden the interpretative context or import ideas about fairness or social policy into interpretation. A third variant of formalism emphasizes the aspiration of the legal system to closure, making it possible to decide cases without adverting to consideration outside of the law itself (Kennedy, 2001). These three types of formalism require separate discussion.

The first type of formalism can be called rule formalism. Legal scholars distinguish between rules that provide bright-lines versus more flexible standards (Kennedy, 1976). The standard example is a numerical speed limit versus a prohibition on driving unreasonably fast. Rules have obvious advantages in terms of providing clear notice and objective standards for decision makers (Schauer, 1988, 1991). Rule formalism states a preference for rules over standards. A disadvantage of rules, however, is that they can never precisely fit the circumstances of each case. For example, without some kind of standard-based exception, a numerical speed limit would make it illegal to travel faster to the hospital in a medical emergency. Standards may provide less notice but have the advantage of being better tailored to produce fair outcomes in individual cases.

A second type of formalism emphasizes the authoritative status of governing legal texts (Scalia and Garner, 2012). Again, there are clear advantages and disadvantages. Texts provide a confined field for legal interpretation, as opposed to approaches allowing consideration of a broader range of legal sources such as legislative history or later judicial interpretations. This may provide clearer notice of legal mandates and might limit the range of disagreement compared to approaches that feature a broader range of sources or reliance on public policy or equitable considerations. The disadvantages are that the text may be misleading if read in isolation from the surrounding context and may lead to undesirable decisions if social policy and equity are excluded from consideration (Llewellyn, 1960).

A third type of formalism emphasizes the autonomy of law, ruling out any considerations that are not based in identifiably 'legal' materials, and suggesting that in principle every legal problem has a right answer. The central idea is that law is a closed system. This idea may be associated with proponents of some forms of legal positivism but is rejected by other legal positivists who see a role for policy considerations in resolving gaps in existing law (Hart, 1994). Moreover, some nonpositivist thinkers also view law as a closed system (Dworkin, 1978).

These three types of formalism are often attractive to the same thinkers, but they are logically distinct. For instance, although the other versions of formalism may share their proponents' aspiration to limit the influence of nonlegal factors, support for rule formalism and textualism may be based on pragmatic justifications rather than a belief in formalism as a jurisprudential position. A rule formalist might believe that the content of the rules should be determined entirely on the basis of policy considerations. Conversely, a jurisprudential formalist could believe that relevant legal materials are not limited to particular texts such as statutes or Constitutions, that texts must be interpreted on the basis of context, and that law often takes the form of standards whose application can only be determined by considering the facts of individual cases.

The ideal type of formalist would combine all these approaches, believing that law is (or should be) a closed system of rules that can be understood and applied through interpretation of authoritative legal texts. Civil code systems in Europe and elsewhere aspire to satisfy all three types of formalism, although perhaps with less success than civil lawyers might like to admit (Merryman and Perez-Perdomo, 2007). As seen in the following section, there was also a period in American law during which, at least according to some legal historians, this ideal type of formalism held sway.

The Rise and Fall of Classical Formalism

By most accounts, the heyday of American legal formalism was the long period of industrialization beginning with the end of Reconstruction (1876) and ending with the New Deal (1933–36). Historians view judicial opinions prior to this era as being more pragmatic and more willing to advert to policy considerations rather than rooting decisions entirely in authoritative legal texts (Gilmore, 1977; Llewellyn, 1960). After the Civil War, however, there was a move toward more rigorous reliance on texts and deduction from general legal principles.

In the classic period of legal formalism, courts disclaimed agency in their rulings, sometimes portraying their roles in more mechanical terms as measuring a situation against legal yardsticks. The role of law was seen as policing clear lines of demarcation among various law-making bodies and between them and private citizens (Kennedy, 1980). Nineteenth-century formalism is often thought to have been allied with business interests, providing protection against regulatory efforts or potential ameliorative changes in the common law (Grey, 1983). But historians generally paint a more complex picture of the relationship between nineteenth-century law and business interests (Friedman, 1973).

Nineteenth-century formalism also saw the law as complete, in the sense of supplying the necessary grounds for deciding legal questions without reference to external systems of morality or policy (Gilmore, 1977). For instance, a leading exponent of formalism famously declared issues of practicality irrelevant to contract law (Grey, 1983). Formalists aspired to a kind of geometric logic in which general premises would generate specific conclusions through deduction (Grey, 1983), although it is not clear whether any formalists actually believed that in practice the law attained this level of logical rigor.

As with many historical periods, the ability to perceive the nature of legal thought during this classical period is obscured by the efforts of succeeding periods to portray negatively prior thinking in order to make the case for new approaches. A full understanding of law from the period of approximately 1870–1930 would surely be more complex than the picture sketched above.

The turn of the twentieth century saw the beginning of a reaction to formalism, starting with work by Oliver Wendell Holmes and culminating in the movement known as legal realism (Pound, 1917; Cardozo, 1921; Gilmore, 1977). Legal realists took a variety of positions but shared a disdain for the formalist view of law as an impersonal neutral process (Kalman, 2011). Instead, they stressed that judicial decisions were intimately related to the judge's values and worldview (Frank, 1949). Following World War II, legal scholars were repelled by the abuse of the legal system under totalitarian regimes and began to place renewed emphasis on the rule of law (Bix, 1999). The result was a domesticated form of legal realism known as the legal process school, which conceived of law as a purposive endeavor requiring sensitivity to context and flexibility in interpretation. Legal process theory in its turn was challenged by the Law and Economics movement, which shared the legal process interest in social policy but called upon the use of economics to resolve policy issues (Posner, 1990). At roughly the same time, the Critical Legal Studies movement revived legal realism with an admixture of postmodernist theory (Kennedy, 1976; Gordon, 1984). What Critical Legal Studies and Law and Economics shared was a rejection of the idea of law as an autonomous enterprise that could be detached from broader policy disputes. In that sense, they were both the antithesis of formalism.

The Formalist Revival

In the post-World War II era, formalism appeared a thing of the past, with the term acquiring a pejorative connotation (Friedman, 1973). Critical Legal Studies and the Law and Economics movements seemed to mark a definitive rejection of the aspiration to policy-free legal decision making. Just when legal formalism seemed extinct in American legal thought, however, it began a revival.

This revival was partly based in the legal academy but received important support from a cohort of lawyers and judges associated with the Reagan Administration (Avery and McLaughlin, 2013). As discussed later, there is no necessary logical connection between formalism and conservative politics, but much of the support for reviving formalism in the United States did come from conservative quarters, paralleling the favorable reception of formalism among conservative jurists in the earlier formalist period.

The revival of formalism was largely but not entirely directed toward public law. Late twentieth-century formalists called for a rejection of evolutionary visions of constitutional law and a return to the understandings of the original framers of the Constitution of the United States. In statutory

interpretation, they called for strict reliance on the text of statutes, undiluted by attention to legislative history or other indicators of legislative intent. Formalists also addressed private law, however, arguing in favor of clear rules to bound tort liability and reasserting the importance of written contract terms as against commercial context or policy considerations.

Originalism in Constitutional Law

Perhaps the most important focal point of the formalist revival, however, was constitutional law. Conservatives rebelled against the concept of a 'living Constitution' and instead demanded a return to the original understanding of the Constitution by its Framers (Scalia, 1998). Originalism rested on a cluster of arguments. First, originalists argued, the Constitution's authority derived from its adoption by a supermajority, so that any interpretation contrary to their views lacked this legitimizing foundation. On the other hand, when judges carried out the views of this supermajority, they could claim a democratic pedigree even for rulings contrary to the views of current majorities (Bork, 1997).

Second, according to originalists, interpretation based on the original understanding was consistent with the methods used to interpret other legal documents such as contracts and wills (Scalia and Garner, 2012). Thus, originalism was faithful to the nature of the Constitution as a legally operative rather than purely political document. It is also, according to originalists, consistent with the 'writeness' of the Constitution, which implies a desire to fix rules rather than leaving them open for revision under the guise of interpretation (Scalia and Garner, 2012).

Third, originalists claimed that their approach would provide a principled basis for litigation, eliminating or at least sharply limiting judicial discretion. Other approaches were too formless to constrain judges from simply imposing their own policy views at the expense of the democratic process. In the view of originalists, such judicial policy making happened all too often especially in cases involving the rights of criminal defendants, religious freedom, abortion, and federal power. They viewed these decisions as lacking any foundation in historical evidence of the Framers' understanding of the Constitution (Bork, 1997).

Originalism initially took the form of reliance on the intentions of the Framers (Bork, 1997). Although this approach still has its adherents, it confronted significant criticisms because of its tension with formalist premises. In formal terms, it is the text of the Constitution that is legally operative, rather than mental states of the Framers. Moreover, the intentions of the various Framers may have been different and even inconsistent with each other. Reliance on expectations about how the Constitution would be applied was an especially slippery basis for interpretation, since those expectations may have been based on factual assumptions that might not hold today or that current society might have viewed as false even then (Berman, 2009).

In response to these concerns, many originalists switched their focus from expectations or intentions to understandings or 'semantic meaning' (Scalia and Garner, 2012; Berman, 2009). Put another way, they de-emphasized the authors of the Constitution in favor of its audience, seeking to identify Constitutional meaning with the interpretation of a reasonable reader of the time. This move to audience understandings has the advantage of operationalizing originalism and providing a recipe of sorts for its application. But it also opens an array of questions about the background knowledge of the reasonable reader and the methods of interpretation that the reader would have applied. Typical questions might be whether the reasonable reader was familiar with Blackstone or Locke, whether the reader should be presumed to apply methods of legal interpretation current at the time, whether the reader would be familiar with documents such as the Federal Papers, and whether the reader had clearly formulated views of constitutional structure and purpose beyond those apparent in the text itself.

Regardless of its particular form, originalism received a barrage of criticism. Critics argued that originalism failed as an effort to root judicial review in the prior democratic adoption of the Constitution. To begin with, critics contended, the adoption of the Constitution itself had suspect democratic credentials. At the time the Constitution or the major Reconstruction amendments were adopted, women did not vote, and blacks were rarely able to do so. Property qualifications were standard in the earlier period as well. And it remains unclear, even apart from these considerations, that a restriction on the current democratic majority can gain legitimacy solely from the facts of its enactment by an earlier, long-dead majority – the well-known 'dead hand' issue (Berman, 2009; Farber and Sherry, 2001).

Another line of attack focused on the originalist contention that their methodology simply applied usual methods of legal interpretation to the Constitution. Some critics questioned this description of legal interpretation. In particular, they questioned whether originalism corresponded to the methods of interpretation used by courts during the period when the Constitution was adopted. Others observed that the Constitution is not the typical legal document and might call for different methods of interpretation (Rakove, 1997).

Critics also attacked the originalist claim of reducing judicial discretion and thereby depoliticizing constitutional law. Historians were startled by the implication that historical events have readily ascertainable interpretations or that contemporary meanings of constitutional texts were clear cut. They also questioned whether lawyers and judges possessed the training and historical knowledge needed for expert judgment about long-ago periods of time. Meanwhile, critics also argued that originalism is indeterminate on the critical question of the level of generality; for instance, in a case involving racial segregation, it is unclear whether judges should be seeking the original understanding about whether segregated schools violate the equal protection clause or the original understanding of the general concept of equality embedded in the clause (Berman, 2009; Farber and Sherry, 2001).

Finally, critics argued that if originalism were consistently applied, it would have unacceptable consequences. Modern Supreme Court decisions banned racial segregation, provided legal protection to advocacy by dissidents, limited discrimination against women, and allowed federal regulation of matters such as employment discrimination, environmental pollution, and organized crime. Critics portrayed originalism as a threat to reimpose an archaic legal order to the detriment of

racial and gender equality and of civil liberties (Farber and Sherry, 2004).

Textualism in Statutory Interpretation

Paralleling the effort to establish originalism in Constitutional law was a campaign for textualism as a basis for statutory interpretation. By the 1970s, the standard judicial approach to statutory interpretation involved consideration of statutory text, purpose, and legislative history (Frickey et al., 2006). Textualists argued with particular force against reliance on legislative history, and for reliance on the statutory text alone. They questioned the credibility of legislative history materials as reflections of the views of legislators. Rather than representing the intent of the legislators, textualists argued that legislative history materials reflected only the views of committees, individual prominent legislators, or even staff members. Consequently, reliance on legislative history in effect delegated power to control interpretation of a statute to a subset of the legislative branch, violating separation of powers principles (Scalia, 1998).

Textualists also argued that recourse to legislative history and speculation about legislative purposes misunderstood the nature of the legislative process. They contended that legislation is inevitably the product of compromise, especially in the US system where so many potential veto points have to be surmounted and minorities thus have multiple opportunities to kill legislation. Such compromises might not be apparent in the legislative history and might indeed be deliberately hidden from publicity (Manning, 2005).

As with originalism, supporters of textualism argued that their approach would constrain judicial discretion and help depoliticize statutory interpretation. Sprawling legislative histories of major legislation provide too many opportunities for judges to cherry-pick snippets supporting their desired outcome. Purposes can be characterized in different ways, making attributions of purpose inherently manipulable. In contrast, the statutory text is a delimited object meant to be understood by the legal community, with any potential ambiguities resolvable by well-known canons of interpretation such as interpretation of ambiguous criminal statutes in favor of the accused (Scalia, 1998; Scalia and Garner, 2012).

Like originalism, textualism gave rise to fierce scholarly debate. Defenders of the use of legislative history argued that it is more credible than textualists admit, because there are likely to be sanctions against committees or sponsors who misrepresent the content of legislation. In addition, many legislators rely on committee reports rather than directly accessing statutory language, so the committee report may be a better gauge of the intentions of Congress. In addition, critics of textualism argue that reliance on legislative history in statutory interpretation does not involve delegation of law-making power to subunits of the legislative branch because legislative history is used to illuminate binding legal texts rather than having any independent force of law (Frickey et al., 2006).

Critics also suggest that textualists oversimplify the legislative process. Positive political theory suggests that legislators are far from chaotic, making it less implausible to attribute purposes to legislation. Moreover, although some legislative provisions are compromises between competing interest groups, others may reflect coherent legislative purposes sought by a unified, dominant coalition. Careful attention to the legislative record combined with an understanding of the key hurdles for particular bills may allow identification of the key actors and reconstruction of their understandings of the legislation (Rodriguez and Weingast, 2003).

Critics of textualism also argue that during the framing period, courts employed flexible methods of statutory interpretation employing ideas of statutory purpose and equity. They point to examples of eighteenth-century courts interpreting statutes to cover significantly less than their texts would suggest, or in some cases significantly more (Eskridge, 2001). Textualists respond that this form of interpretation predated a better understanding of the system of separation of powers inaugurated by the Constitution, and that courts soon began to employ less flexible methods of interpretation (Manning, 2001).

Like critics of originalism, critics of textualism also argue that its determinacy is substantially overrated. In interpreting a statute, a textualist must choose a segment of text to interpret (the whole statute, the narrow provision at issue, or something in between). The textualist also has a choice of different resources to use in interpreting language, including multiple dictionaries that may have varied definitions of terms. In construing ambiguities, the textualist has recourse to a stable of interpretative canons that often conflict in their implications in particular cases (Frickey et al., 2006). Thus, textualism may not be successful in cabining discretion, at least if the critics are correct.

Formalism and Precedent

Formalists employing originalism or textualism also must confront another problem. In many cases, a court does not operate on a clean slate, but instead confronts one or more precedential opinions, which often will not rests on these formalist theories. The formalist judge may then be faced with following precedents that the judge views as incorrect or rejecting wholesale an established body of precedent. If the judge decides not to overturn precedent, the question arises of how broadly to interpret the precedent. Few formalist judges are willing to completely ignore precedent. But accepting nonformalist past rulings can also result in a patchwork of rulings based on inconsistent grounds (Farber and Sherry, 2008).

The Formalist Revival in Private Law

Formalism has also had a revival in private law. In contract law, for example, post-World War II doctrine and scholarship stressed contextual interpretation in order to give effect to the intentions of the parties, including broad consideration of trade usage, past dealings between the parties, and the negotiations over the contract. Courts were called upon to fill contractual gaps on the basis of reasonableness (Llewellyn, 1931). Since the 1980s, however, there has been a countermovement among scholars to give more weight to the text of the agreement and to limit consideration of context or determinations of reasonableness. This

countermovement is based on doubts about whether courts can accurately determine the intentions of the parties and on the desirability of providing certainty regarding the meaning of commercial agreements (Schwartz and Scott, 2010).

Similarly, in tort law, post-World War II scholars and judges tended to view torts as a mechanism to deal with the social costs of accidents. This perspective supported a broadening of liability and a move away from reliance on clear rules toward more general standards based on reasonableness. More recently, however, there has been a renewed effort to provide clear limits on tort liability by delimiting a defined set of potential victims who are recipients of the duty of due care (Goldberg, 2010).

Rules versus Standards

The rise of originalism and textualism was paralleled by a more general defense of rules as against standards by scholars, including now-Justice Antonin Scalia (Scalia, 1989; Alexander and Sherwin, 2001). The argument stresses certain functions of law that may be best achieved by rules. First, to the extent that laws are intended to guide behavior, rules may give clearer guidance than standards about society's expectations. The implicit comparison is between a standard and a single clearly stated rule. Translating the substance of a standard into rules, however, might require a complicated code that may be opaque to many individuals.

A second formalist argument for rules is that they better serve the dispute-resolution purpose of law (Alexander and Sherwin, 2001). If a rule is clear, all parties should be able to agree on the resolution of the dispute. On the other hand, a standard will be much more subject to dispute. Worse, application of the standard may depend on normative judgments based on concepts such as reasonableness or good faith, and the parties are likely to have different moral judgments about the situations (Scalia, 1989; Weinrib, 1988).

Finally, to the extent society aspires to the rule of law rather than the rule of persons, rules may be more readily subject to objective interpretation rather than depending on the perspective and values of the judge. It is for this reason that some formalists have suggested that the rule of law and the law of rules are identical.

The Two Eras of Formalism

There is an obvious kinship between the two eras of formalism in their goals and in at least some of their methods. Modern formalists, however, do not commonly portray themselves as seeking to return to a lost golden era of late nineteenth-century law. The reason may be that the legal realists so successfully lambasted classical formalism as to discredit it as a source of inspiration.

Like classical legal formalism, the revival of formalism in American legal thought was linked with conservative ideology, in particular with the conservative revival of the Reagan years (Greene, 2009; Avery and McLaughlin, 2013). This historical connection with conservative politics raises the question whether formalism and conservatism share a deep conceptual connection. It also raises the question of whether formalism in fact constraints judges or merely provides a rhetorical framework for decisions that are driven by other factors. The author considers those issues below.

Formalism, Ideology, and Judicial Behavior

Despite the correlation between formalist and conservative views, the relationship is surely not universal. For example, Richard Posner, a leading conservative scholar and jurist, is profoundly antiformalist (Posner, 1990). On the other hand, some progressive legal scholars such as Jack Balkin have embraced originalism (Balkin, 2011), and the most notable contemporary liberal legal philosopher endorsed a version of the formalist view of legal closure (Dworkin, 1978).

These examples indicate that the link between formalist approaches and specific legal outcomes may not be powerful. If both conservatives and liberals can embrace originalism without any sense of discomfort, this suggests that originalism may not be experienced as requiring changes of position regarding issues such as affirmative action, abortion, or states' rights. If this is correct, it may have negative implications for the formalist aspiration to constrain decision making and reduce the influence of 'nonlegal' factors such as political ideology or judicial background.

The success of formalism as a normative system is best assessed through empirical evidence. There is a limited but growing empirical literature in this area. The extant evidence, discussed in this section, reinforces doubts about the potential for formalist methodologies to shape outcomes in judicial decision making.

Despite all the debates over textualism and statutory interpretation, scholars know relatively little about the practical impact of various theories of interpretation. A good test would involve presenting randomly selected cases to two judges who are similar in most other respects but have sharply different theories of interpretation. A natural experiment is provided by a study of two judges on the same court, Judges Posner and Easterbrook, who at the time of the study had sat together on over 800 reported decisions by three-judge panels of the United States Court of Appeals for the Seventh Circuit (Farber, 2001). Posner is a leading advocate of pragmatism, while Easterbrook is equally well known for his support of formalism. In other respects, the two judges are very similar: both are conservative, both were professors at the University of Chicago Law School, and both are highly cited. As it turns out, the two judges voted differently in only 1% of these roughly 800 cases. This was substantially below the average level of disagreement among Seventh Circuit judges, and was also below the average rate for courts of appeals generally. Moreover, a careful examination of the statutory cases in which the two judges disagreed confirms that their theoretical disputes were not outcome determinative. Because Posner and Easterbrook have shown particularly serious interests in theories of interpretation (compared to most judges), the apparently slight level of impact on outcomes seems especially surprising. While far from definitive, this study suggests strongly that any link between theories of interpretation and judicial decisions

may be tenuous. If true, that would have negative implications for the aspiration of textualists to constrain judicial behavior, and instead would support more legal realist views that emphasize judicial ideology and worldview.

Other studies also suggest that formalist methods have at most modest effects on judicial outcomes. Using data derived from briefs filed by litigants over 8 years, researchers tested the influence of arguments about text and intent on the decisions of US Supreme Court Justices (Howard and Segal, 2002). They found that judges supported textual or intentional arguments when they were made by parties in their own ideological camp but not otherwise. Their analysis indicated that ideology was a more powerful influence on decision making than adherence to originalism. Questions about the constraining effect of originalism were also raised by a study of a federal appellate court, which found that reliance on originalism by liberal judges actually increased the likelihood of a liberal result (Czarnezki and Benesh, 2009). A more recent study of originalism suggested that it may also be unsuccessful in constraining judicial behavior. Although originalism may figure increasingly in judicial opinions, the study suggested that substantial flexibility is provided by the complexities of the historical record and by the methodological options available within originalist theories (Cross, 2013). This flexibility allows judges to deploy originalism, whether as a rationalization or as a sincere justification, on more than one side of controversial issues such as Second Amendment protection for guns.

In terms of the closure thesis, the advent of modern databases of judicial opinions has allowed some systematic study of the impact of the formalist revival on the types of materials referenced by judges. The evidence to date indicates that citations to formalist sources may have increased but that courts continue to rely on a wide variety of sources beyond statutory and constitutional text or historical documents such as the Federalist Papers (Zeppos, 1992; Krishnakumar, 2010; Schacter, 1998).

In terms of rules versus standards, empirical evidence seems to be lacking on whether in application formal legal mandates based on rules provide more predictability or a better public understanding of legal requirements than mandates based on standards. The answer is less obvious than it might seem, in part because what appears to be a rule (it is illegal to drive over the speed limit) may in application be a standard (drivers will be ticketed if they drive too much over the speed limit).

Legal formalism tends to be a subject on which legal philosophers, historians, and judges take sides. The subject would benefit from more dispassionate investigation, and in particular from more empirical investigation of formalist and antiformalist claims. Despite what some observers might have thought a half century ago, however, there is no sign that formalism is likely to disappear or that the vigorous debates over its validity are likely to fade.

This article is a revision of the previous edition article by R. MacCoun, volume 13, pp. 8641–8646, © 2001, Elsevier Ltd.

Abstract

This article reviews trends in public opinion toward laws, legal authorities, and the functioning of the legal system, and the psychological and sociological bases for those opinions. Section Public Evaluations of the Legal System: An Overview examines the general favorability of public evaluations of the legal system. Section Sources and Mechanisms of Influence on Public Views examines mechanisms of influence on public opinion. Section Underlying Dimensions of Public Evaluations of the Legal System documents the highly multidimensional nature of citizen evaluations of legal issues.

This article reviews trends in public opinion toward laws, legal authorities, and the functioning of the legal system, and the psychological and sociological bases for those opinions. Section Public Evaluations of the Legal System: An Overview examines the general favorability of public evaluations of the legal system. Citizens in many nations tend to rate the police favorably, but there are notable exceptions, both within nations (e.g., African Americans in the United States) and across nations (e.g., East Germany in the 1980s). Judges are viewed favorably, but in some nations there is a persistent view that criminal sentences are too lenient. Section Sources and Mechanisms of Influence on Public Views examines mechanisms of influence on public opinion. Direct experience with legal authorities is important, but because such experience is fairly limited for many citizens, the mass media play a significant and frequently distortive role in shaping public views. Cognitive mechanisms, such as hindsight bias, can also skew public perceptions and evaluations. Section Underlying Dimensions of Public Evaluations of the Legal System documents the highly multidimensional nature of citizen evaluations of legal issues. These dimensions include outcome satisfaction, distributive justice, procedural justice, retributive justice, fear of crime, fear of legal sanctions, and legitimacy. Research has identified distinct criteria that influence each dimension.

Two guiding principles of Western democratic thought are that effective government requires the consent of the governed, and public consent requires the fair and just rule of law. Thus, research on public opinion toward the law and the legal system has preoccupied mainstream social science for much of its history, reappearing in various guises, including the 'free press vs fair trial' debate, seemingly paradoxical links between actual crime and fear of crime, public disdain for 'judicial leniency,' and theories of perceptual deterrence.

This short review will of necessity be selective in its coverage. With respect to substantive legal issues, it will emphasize criminal justice, providing only passing references to tort litigation and no coverage of public opinion in the domains of contract law, family law, intellectual property law, and so on. With respect to methodology, it will emphasize quantitative public opinion surveys, statistical modeling of field data, and laboratory experiments, neglecting the rich but idiosyncratic literature using qualitative interviews and qualitative analyses of textual sources. Finally, the article – like the English-language empirical literature – gives disproportionate emphasis to North American and British research, although some lines of cross-cultural research are noted.

Public Evaluations of the Legal System: An Overview

Evaluating the Police

In the aggregate, Americans and Europeans evaluate the police favorably. A majority of Americans report that the police have high or very high honesty and ethical standards (Bureau of Justice Statistics, 2011). Such confidence is not to be taken for granted. For example, in 2011, most European Union citizens expressed a high level of trust in the police (between 60 and 90%), while the average was much lower in nine Eastern European countries (e.g., around 40% for the Czech Republic, Romania, Slovenia, Slovakia, and Bulgaria; Eurobarometer©, European Union, 2012). Within the United States, African Americans consistently report more negative views of police conduct than the white majority; they are about twice as likely to report low confidence in the police or to express the view that the police have low ethical standards.

Evaluating Attorneys

Most adults know, or at least recognize, a few of the multitude of 'lawyer jokes' long in circulation (see Galanter, 1998). We rarely tell jokes about physicians, whom we hold in high regard, or molesters, whom we loathe. This suggests that we are ambivalent about lawyers; we decry their ruthless mercenary adversarialism – except when they are representing us in a conflict. Thibaut and Walker (1975) asked Americans to imagine various hypothetical conflicts and various mechanisms for resolving them – including two-party mediation, third-party investigation and resolution by a neutral inquisitor, and a third-party decision based on investigation and arguments presented by advocates for each side. Importantly, the descriptions were stripped of labels like 'lawyer' or 'judge' and other overt references to actual legal systems.

A strong majority identified the adversarial system as the fairest mechanism. Subsequent studies (see Lind and Tyler, 1988) have replicated this finding in European nations with inquisitorial systems, suggesting that it is not an artifact of American socialization or familiarity with adversarial justice. However, respondents in Asian countries tend to divide their support between the adversarial model and two-party mediation.

Evaluating the Courts

Americans – of all ethnicities – are more than three times as likely to rate the honesty and ethical standards of judges as high or very high (47%) than low or very low (14%) (Bureau of Justice Statistics, 2011). But this high regard does not translate into satisfaction with judges' decisions. For several decades in the twentieth century, American public opinion polls showed consistent majority support for the view that the courts are too lenient in their treatment of criminal defendants (Bureau of Justice Statistics, 2011). Interestingly, African Americans are only slightly less likely to endorse this view, and the gap between racial groups has been closing.

Taken at face value, these statistics imply that the courts are either 'out of touch' with public views or intentionally ignoring them. There is some basis for the latter interpretation, of course; Western systems of rights and protections evolved in large part to protect individuals from group tyranny. But a number of clever experiments reveal that these citizen complaints are largely based on distorted perceptions of the justice system and its caseload (see Roberts and Stalans, 1998). Citizens who view courts as lenient in the abstract have been found to recommend criminal sentences that fall *below* statutory mandatory minimum sentences or the discretionary sentences of judges. And citizens' views in actual cases become significantly more lenient when they read lengthy trial descriptions rather than short trial summaries.

While there is consistent evidence that Americans hold much more favorable opinions of the jury system than of the courts more generally (Harris Poll, 2008; Hans, 1993) and specifically prefer trial by jury to trial by judge (MacCoun and Tyler, 1998), there is evidence that race strongly influences this preference. Rose et al. (2008) find that non-Hispanic whites have a strong and consistent preference for juries, African Americans and 'English-dominant' Hispanics have a less pronounced preference for juries, and Spanish speakers and noncitizens have a clear preference for judges.

Sources and Mechanisms of Influence on Public Views

Direct Experience

The procedural justice literature documents the importance of direct personal experience in shaping the public's views of law and legal authorities. Most citizens have had direct contact with the police, some have had contact with lawyers, fewer have participated in trials, and only a minority has direct experience with the penal system. There is evidence that the custodial aspect of the criminal justice system has a negative effect on political participation for those who do come into contact with it, even controlling for criminal propensity or socioeconomic status (Weaver and Lerman, 2010).

For many citizens, jury service is their major (or only) direct experience with the court system. Diamond (1993) has reviewed survey evidence on the effects of jury service on public attitudes, finding that a majority of jurors provide positive evaluations of the jury system, and of the legal system, after their service. Most jurors say their attitudes became more favorable than they were before their service, and attitudes are more favorable among those who are selected for a jury than among those who report but are not seated.

Mass Media Effects

Citizens without direct contact with the legal system must base their views on other sources. But even those with direct experience are routinely bombarded with indirect, vicarious information. There is an enormous literature demonstrating that the mass media provide and promote distorted views of not only crime but also the criminal justice process and the outcomes of the justice system (e.g., Roberts and Stalans, 1998; Warr, 1994). The presumed causal chain is ACTUAL EVENTS → MEDIA FILTERING AND DISTORTION → BIASED PUBLIC BELIEFS AND OPINIONS, with these public views feeding back to the media via consumer choices.

The first part of the chain is well supported. Numerous content analyses over several decades show a consistent pattern: media coverage provides a highly skewed picture of crime and the legal system, and this is true of newspapers, television news, 'reality-based' police shows, and fictional portrayals on television and in movies. In the criminal domain, reported offenses are disproportionately violent, defendants are disproportionately African American, police officers are disproportionately European American, victims are disproportionately female, and offenses disproportionately involve strangers (see Warr, 1994). In the personal injury domain, reported lawsuits are much more likely than the typical or average lawsuit to result in a jury trial and to produce a plaintiff victory, while reported state court jury awards are 14 times larger than the average award and 34 times the size of the median award (Bailis and MacCoun, 1996).

There is also evidence for the second half of the causal chain. The prejudicial effects of pretrial publicity on criminal juror judgments are well documented (see Steblay et al., 1999). And numerous studies indicate that citizens' views of court leniency are shaped by the mass media (see Warr, 1994). Citizens tend to overestimate the severity of typical crimes and criminals (relative to official statistics), and these misperceptions reliably predict the propensity to see the courts as excessively lenient; citizens given newspaper accounts of trials supported harsher criminal sentences than citizens who read actual court documents from the same cases (see Roberts and Stalans, 1998).

Hindsight Bias

Hindsight bias is the *ex post* tendency to overestimate the *ex ante* likelihood of an outcome, relative to what one would have actually guessed before the event. Because most legal judgments are made *ex post*, they are vulnerable to this bias, as

documented in a variety of experimental studies (Rachlinski, 1998). Hindsight bias also influences citizens' *ex post* reactions to newsworthy legal decisions. Trial evidence appears more incriminating to people who believe a defendant has been convicted than for those who believe the defendant was acquitted (Bodenhausen, 1990).

A pernicious example of this phenomenon was the elite and popular reaction to the acquittal of actor–athlete O.J. Simpson at his criminal homicide trial in the United States. Because nine of the 12 jurors were African American, a large number of commentators, including the lead prosecutor, 'explained' the verdict as a case of 'racial nullification' – the notion that African Americans are more lenient when judging other African Americans. In an October 1995 Gallup poll, 48% of whites vs 18% of African Americans said they had 'less confidence' that 'jurors can reach a verdict in a trial without letting their racial attitudes affect their judgment' (Moore and Saad, 1995). In fact, the jury literature provides little support for 'racial nullification' as a general phenomenon (Kerr et al., 1995). The reasons for the acquittal will never be known with certainty, but it seems clear that pronouncements of 'racial nullification' reflected hindsight bias. Despite widespread knowledge of the composition of the jury, surveys during the trial showed that few trial attorneys and citizens expected an acquittal; indeed, the *Sporting Index* reported that most American gamblers were betting on a conviction (*Los Angeles Times*, 1995).

Underlying Dimensions of Public Evaluations of the Legal System

The history of theory and research on lay justice judgments involves a continuous branching process in which simple, unidimensional models have given way to more complex multidimensional models (see Tyler et al., 1997).

Outcome Satisfaction, Relative Deprivation, and Distributive Justice

Economics, behaviorist psychology, the social exchange tradition of sociology, and the public choice tradition of political science share a common emphasis on the explanatory power of outcomes and incentives. The mass media and the legal literature tend to perpetuate the view that outcomes – especially monetary outcomes – drive legal behavior, legal judgments, and evaluations of the legal system. An early refinement of this view was relative deprivation theory (see Tyler et al., 1997) – the notion that what matters to citizens are relative outcomes (mine vs yours or theirs) rather than absolute outcomes. As a predictive theory, the relative deprivation approach has had only mixed success, in large part because the theory *overpredicts* resentment and rebellion. One problem is that the theory fails to predict which of many possible comparison standards the citizen will use; citizens do not invariably choose the source that provides the most invidious comparisons. Another weakness is the failure to predict whether outcome discrepancies will be seen as justified or not.

Descriptive (rather than normative) theories of distributive justice address this latter gap. In the 1970s, the most influential model was equity theory (e.g., Walster and Walster, 1975), which models justice judgments as a function of the relative ratio of inputs to outcomes for each actor in a relationship. Indeed, in reactions to job-related conflicts, citizens in Eastern and Central Europe (Bulgaria, Hungary, Poland, and Russia) are at least as likely to apply this equity standard as are citizens in traditional Western market democracies (France, Spain, and the United States) (Cohn et al., 2000). But it has become clear that this model works less well in nonmarket contexts and relationships (Fiske, 1992). Across various settings, studies have found support for allocation by equality, by need, or by more complex multidimensional decision rules (see Mellers and Baron, 1993). In addition, judgments of distributive justice (and their behavioral consequences) vary by social level of analysis; for example, perceiving that one's group has received unfair outcomes is more likely than purely individual deprivation to motivate anger and political action (see Tyler et al., 1997).

Citizens' judgments about monetary outcomes – punitive damage awards, child support awards, and regulatory fines – can appear incoherently volatile, but there is more coherence than meets the eye. Citizens tend to agree on relative magnitudes across case characteristics (i.e., the slopes of the predictor variables) but vary considerably in their sense of absolute magnitudes (i.e., the y-intercept terms). Much of the latter variation is explainable by differences in distributive justice beliefs, but some is due to the inherent difficulty of mapping subjective judgments onto the dollar metric (Ellman et al., 2012).

Procedural Justice

Outcomes are clearly linked to public evaluations of justice, but there is growing evidence that scholars have overestimated the importance of this linkage. Thibaut and Walker's (1975) influential experimental research program provided considerable evidence that the processes by which outcomes are reached matter profoundly to citizens. Since the 1970s, this 'fair process effect' has been replicated across a wide variety of nations (in North America, Europe, and Asia), domains (criminal justice settings, tort litigation, private organizations, and the political sphere), and dependent variables (satisfaction with the legal system, acceptance of third-party decisions, compliance with legal authorities, and decisions to file lawsuits) (see Lind and Tyler, 1988; MacCoun, 2005; Tyler et al., 1997). In a surprising number of studies, procedural justice judgments emerge as stronger independent predictors than either objective or subjective measures of the outcomes that citizens received.

Thibaut and Walker (1975) contended that procedures matter to citizens because fair procedures produce fair outcomes. The key parameters of their model were decision control and process control; the latter is important because it is rarely possible to resolve conflicts without relinquishing some decision control. The predominant determinant of process control in the Thibaut–Walker program was 'voice' – the opportunity to control the presentation of one's arguments to a third-party decision maker. Even among tort litigants, popularly portrayed by the media as greedy plaintiffs and stingy defendants, the 'opportunity to tell my story' is the

most commonly cited goal of both sides. Indeed, this voice motive helps to explain why alternative dispute resolution (ADR) mechanisms have generally failed to streamline court trial dockets; because ADR provides a relatively cheap way to 'tell my story,' it diverts more cases from private settlement than from trial (see MacCoun, 2005).

Thibaut and Walker's control-based account of voice effects has fared less well. Lind and Tyler (1988) have provided the most empirically successful account of voice effects. Their group value theory argues that voice effects are 'relational' rather than instrumental; they reflect citizens' motivation to achieve a favorable and secure social identity. In numerous studies, relational concerns – the sense that authorities acted with benevolent and impartial motives, and that one was treated with dignity and respect – emerge as more important determinants than either outcome evaluations or perceptions of control (Lind and Tyler, 1988; Tyler, 1990; Tyler et al., 1997). Within the United States, these relational factors are found in judgments across gender, ethnic, educational, and occupational categories, and these findings have been replicated in Europe and even in more collectivist Asian societies (Tyler et al., 1997).

There are moderators and boundary conditions on the model. Procedural justice effects are weaker for citizens who identify strongly with a subordinate group but weakly with a superordinate group (e.g., minority 'separatists' as opposed to 'assimilationists'). Another is that procedures matter more when citizens lack clear objective criteria for evaluating outcomes (van den Bos et al., 1997).

Nevertheless, fair process effects are so robust that scholars fear they pose a threat of 'false consciousness' – the notion that authorities can use the appearance of fair procedure (dignity, respect, and voice) as an inexpensive way to co-opt citizens and to distract them from outcomes that by normative criteria might be considered substantively unfair or biased (e.g., MacCoun et al., 1992). For example, an insurance executive requested a meeting with two procedural justice researchers to ask how he might increase the formality of meetings between clients and insurance adjustors, in order to reduce the rate of contested claims.

Retributive Justice

It is important to note that citizens' departures from pure economic self-interest are not merely warm, sentimental, and benevolent. The behavioral game theory literature has provided ample evidence that people will often forgo personal gain in a spiteful attempt to harm others, and it is tempting to interpret the strong retributive streak in American public opinion in a similar way. From the 1980s through the 2000s, the United States experienced a dramatic escalation in the size of its prison and jail populations (Glaze, 2011), especially relative to those of other industrialized nations. Between 1985 and 1996, the prison population more than doubled, yet the percentage of Americans who felt that their courts were 'not harsh enough' only dropped from 84 to 78% (Bureau of Justice Statistics, 2011).

Public misperception of crime rates is surely a partial explanation, but several lines of evidence implicate retributive motives, rather than an instrumental attempt at crime control. For example, many citizens overtly endorse a deterrence rationale for the death penalty, believing that 'it will prevent crimes.' Yet most do not change their views when asked how they would feel if there were unequivocal evidence that execution provided no marginal deterrence above and beyond life imprisonment (Ellsworth and Gross, 1994). Moreover, there is evidence that even those who endorse deterrence apply a 'just deserts' framework of proportionality to justify punishment – suggesting that people believe crimes like murder deserve the most severe punishment, but not necessarily the death penalty (Carlsmith et al., 2002) (*see* Death Penalty).

Fear of Crime

It is a cliché among academicians that fear of crime bears no relation to actual crime rates. In fact, between 1973 and 1987, American fear ratings moved in tandem with the violent crime rate (Warr, 1994). But perceptions of crime trends are not very accurate; a growing minority (from 4% in 1993 to 35% in 1998) recognize that US crime fell in the late 1990s, but since then, an increasing number (from 34% in 2000 to 68% in 2011) contend that 'there is more crime in the US than a year ago' (Bureau of Justice Statistics, 2011).

In many surveys, the elderly and women express the most fear of crime; these patterns are called 'paradoxical' (because young males are the group at greatest risk of victimization) but only under the peculiar notion that fear should solely reflect relative statistical risk. It appears that these patterns reflect not only differences in the way women and the elderly conceptualize the question (Ferraro, 1995; Warr, 1994), but also the influence of media depictions that exaggerate the incidence of crime (Warr, 2000) and the proportion of crimes in which the victims are white females (Chiricos et al., 1997). That fear of crime is an expedient tool for garnering political support further complicates the issue (Warr, 2000; Chevigny, 2003).

But the fear literature is plagued by inconsistent findings, perhaps due to a frequent reliance on crude, single-item 'fear' measures (e.g., 'How safe do you feel being alone in your neighborhood at night?') that may not measure the experience of fear (i.e., events in the amygdala and autonomic nervous system) and that surely tap other constructs, like perceived risk, attitudes toward the police and the courts, attitudes toward stereotypic offender groups (youth, males, and ethnic minorities), and so on. For example, Quillian and Pager (2001) found that the percentage of black males in a neighborhood was significantly associated with the perception of crime rates – even controlling for the actual crime rate and other neighborhood characteristics. Local racial composition is also a significant influence on the perception of crime victimization risk (Quillian and Pager, 2010).

Fear of Legal Sanctions

The general public tends to exaggerate the risks of arrest and punishment for many crimes, relative to actual risks and to the more accurate risk perceptions of active criminal offenders; indeed, citizens in states that have decriminalized marijuana are only slightly less likely to believe that possession of small quantities is punishable by incarceration (MacCoun et al., 2009). These facts are consistent with either a deterrence

interpretation (a perceived legal risk deters crime) or a learning interpretation (offenders learn that legal risks are low). But quasi-experimental studies of legal interventions and panel self-report surveys suggest that the certainty of sanctions does deter crime, and that the effects of sanction severity are weak and unreliable (Paternoster, 1987) (*see* Deterrence).

Legitimacy

In a series of experiments, Robinson and Darley (1997) identified numerous discrepancies between the Model Penal Code and lay intuitions about legal liability. They hypothesize that congruence between lay views and the formal law enhances both legitimacy and compliance. Tyler's (1990) panel survey of Chicago citizens suggested that those who perceived laws and legal authorities to be fair were less likely to report having committed criminal offenses when surveyed at a later point in time. A reanalysis of data from the Milwaukee Domestic Violence Experiment found that the perceived unfairness of police interventions was a stronger predictor of subsequent domestic violence than was the initial decision to arrest or not to arrest the offender (Paternoster et al., 1997).

Conclusion

Public opinion research on legal issues has benefitted enormously from the increasing use of advanced multivariate analyses, panel surveys tracking individuals' views over time, and factorial experiments. But there are far too few cross-national studies. The bulk of the English language literature describes the views of North American and British citizens in the late twentieth century. Thus, we still know far too little about how people judge laws and legal authorities outside of common law systems in wealthy, advanced industrial nations. We do not know whether these Anglo-American views reflect fundamental psychological principles or simply the particular context in which they were expressed.

Abstract

Legal personality is the compendium of rights and duties that enable an actor to function in a legal system. A legal actor may be a human being, an organized entity, or even an object, or an office. Legal personalities need not all have the same content. The existence and content of any given legal personality may be a matter of both theoretical and historical controversy. At one extreme some theorists hold that legal personality inheres in certain individuals and entities. At the other extreme theorists maintain that large personality is a matter of a grant of personality from the sovereign authority. In practice all systems reflect aspects of both theories. While the debate over legal personality has deep roots in Western culture, the most prominent example in recent centuries of disputed legal personality is that of the business corporation. The history of the legal personality of the business corporation demonstrates not only the tension between the theoretical approaches to legal personality but also the ways in which the debate reflects larger politics, instrumental needs within a culture, and the malleability of jurisprudential concepts.

In order to be able to participate in any legal or political system an actor must have a legal personality, that is, a set of rights and duties recognized by that system. In theory a legal system may be premised on the belief that certain actors have an inherent legal personality, or that legal personality is entirely a matter of the grant of rights and placement of duties by the sovereign, or that some actors have inherent legal personalities and some are granted a personality. In practice, however, every legal system both recognizes rights and duties in certain actors and insists that certain legal personalities are a matter of positive law. As a historical matter, the content of an actor's legal personality has waxed and waned depending on the legal system in question, instrumental questions about the utility of legal personality, and cultural presuppositions about who and what might have the benefit of rights or the burden of duties. Especially because a legal actor may be neither human nor animate, as when a corporate body has a legal personality, discussions of both the legitimacy and the content of the actor's legal personality may become quite controversial. Thus, the jurisprudential basis for an actor's legal personality is a matter of theoretical and historical concern.

Every legal system must decide which individuals and collectivities, whether formally or informally constituted, or anything else, have legal personalities and what the content of those legal personalities might be. Some legal systems assume that certain actors have rights within the system based on inherent features of the actors, such as their humanity. Every legal system also grants certain actors not assumed to be able to act within the system the right, sometimes limited, to pursue their legal aims. This ascription of rights and duties upon an entity not presumed to be able to act within the system is its legal personality. Some legal systems, notably those premised on natural law (*see* Natural Law), but certainly not limited to such systems, have recognized that some actors have inherent legal personalities. In systems of positive law (*see* Legal Positivism), however, no quantum of rights inheres in any actor, at least in theory. Nonetheless, the history of legal personality is replete with examples of legal systems recognizing inherent rights in individuals, groups, and entities, whether their right to participate in the system is presupposed or granted as a matter of positive law.

The most prominent twentieth-century example of an entity granted legal personality is the business corporation, though the history and theory of legal personality long antedate the business corporation. Religious, charitable, and governmental bodies are among the entities that have historically been granted legal personalities, especially insofar as legal systems have recognized distinctions between the rights of an office as distinct from the rights of the person occupying the office. Moreover, in legal systems characterized by hierarchies of actors not all human beings have been assumed to have full legal personalities. Therefore, women (*see* Gender and the Law), children (*see* Children and Law), slaves (*see* Slaves and Slavery, History of), and foreigners, among others, have had to have their legal personality defined. Recently, the possibility of ascribing legal personality to animals and other entities has entered jurisprudential debates, largely in the hope that in doing so the legal system would necessarily find that they have rights that might be vindicated.

Legal Personality, Inherent Rights, and Positive Law

Two theoretical difficulties attend the concept of legal personality. The first is the class or classes of entities, which have personality in the eyes of the law. The second is whether legal personality inheres in any entity and what the content of inherent legal personality might be. Systems premised in natural law of some variety, for example, assume both that individual human beings have an irreducible quantum of legal personality and that the content of that personality provides each individual with a certain level of protection and dignity. Such systems need not, however, treat all human beings as having equivalent legal personality. An aristocrat and a slave may each possess a legal personality, but they need not be equal. Nor do political systems have to limit their vision to an

individualist conception of personality. Theories of organic polities, for example, those premised in republican (*see* Republicanism: Philosophical Aspects) or communitarian ideologies, maintain that group identity is fundamental to social organization and should be recognized at law. Even societies with a largely individualist politics recognize the legitimacy of some group activity. Legal personality may therefore be presumed to inhere in collectivities within society, such as tribes, governments, churches, and even offices, such as governmental or religious offices. The difficulty in any such system is, of course, that human beings are required to discover both who and what might have a legal personality and then to discover the content of that personality.

Systems of positive law appear to solve the problem of legal personality present in systems, which maintain beliefs in inherent legal personality. Under positive law legal personality does not inhere in anything or anybody but is rather the result of a grant by the sovereign authority. Hence, legal personality is a fiction created by the sovereign for instrumental purposes. The sovereign may decide to grant the right to act within the legal system to a person, to a class of persons, or to groups of people, constituted either formally or informally within the social structure. Indeed, the sovereign may grant the right to act to inanimate objects or to entities, which are themselves the creation of the sovereign, such as corporate or subsidiary political entities. The difficulty presented by systems of positive law is, however, one of rights consciousness within a culture. That is, cultural conceptions of the dignity of human beings, either individually or collectively, the naturalness of human associations, or even conceptions of the inherent rights of, for example, animals, may war with the sovereign's willingness to grant legal personality, no matter how minimal.

In practice virtually no system is either purely one in which legal personality inheres in people or things or in which the sovereign jealously guards the prerogative of the grant of personality. Systems premised on an understanding of inherent legal personality find themselves constantly revising the classes of individuals and entities covered and constantly discovering new aspects of their legal personalities. Moreover, sovereigns within such systems also indulge in the power to grant legal personality. Systems of positive law regularly discover that they must recognize aspects of legal personality that are not spelled out within the grant of personality. Couched sometimes as inferences from the grant and sometimes as necessary components of any grant of personality, these redefinitions of legal personality depend upon changing cultural, especially changing political and economic, circumstances for their content, even though the content of the changes must be recognized by some arm of the sovereign, for example, the courts. The history of legal personality demonstrates, moreover, that conceptions of legal personality have not neatly evolved from concepts of inherent personality to positive grants of personality. Instead, concepts of legal personality both depend upon and in turn influence surrounding circumstance.

Legal Personality in Jurisprudential History

The conflict between inherent and fictive conceptions of legal personality has a long history. Among the first instances in which the distinction between inherent and fictive legal personalities arose in Western culture came during the thirteenth century during the papacy of Innocent IV. The Pope, attempting to consolidate the power of the Church and to harmonize society under its auspices, used the concept to delegitimate the authority of institutions inferior to the Church. As the Church was the agent of God, all collective human activity was subordinate to it. Thus, other institutions were inferior to the Church and owed their existence not to their independent authority but existed at the behest of the Church or by its grace. They were, therefore, legal fictions. The Church was not alone in its attempt to subordinate other human institutions by fictionalizing their existence.

The early modern state and its successors have also tried to centralize power by subordinating other human institutions in the name of sovereignty. For example, guilds could only be legitimate to the extent that they acknowledged their derivative status. Similarly, corporate bodies could maintain corporate status only by virtue of charters. Under the Bubble Act collective corporate activity in England could be prosecuted unless done under charter, though such prosecutions were evidently quite rare. In the United States the power of cities, towns, and other local entities derives from the individual states. Indeed, even the sovereign authority of the states and the other sovereignty recognized within the United States, that of the Indian nations, have their own tortured histories. The reason they are tortured, of course, is that modern political consciousness accepts Innocent's positivist precept, that authority to act within a legal system depends on a grant from the sovereign authority, turning the concept of a sovereign existing within another sovereign into a first rank problem of political logic.

By way of contrast, the concept that legal personality is inherent stems both from aspects of natural law and political conceptions of an organic society. The religious traditions that informed natural law suggested that individuals possessed a minimum of dignity that others, the sovereign included, were bound to respect. Failure to respect human dignity imperiled one's soul. The history of the law of slavery is, for example, in many ways dependent on the distinction between the recognition of a slave's human dignity and the consideration of the slave's status as mere property. Parallel considerations animating organic politics legitimate recognition of groups and group activity. Some political theorists have long argued that social groups and collective activity are fundamental aspects of human life and therefore the recognition by a legal system of collective identity and the legal right of collective activity is not a function of sovereign grace but rather a function of the human condition. Such recognition has taken a variety of forms throughout history. Recognition of social and political class divided parliamentary bodies in England and France, whereas, at least in the pre-Civil War United States, one's loyalty to a state, defined formally as a geographic matter and informally as a matter of culture and politics, in part grounded the legitimacy of the federal system. Belief in the inherent legitimacy of group activity has informed spirited intellectual and political activity, such as Frederic Maitland's late nineteenth- and early twentieth-century desire to undermine certain individualist premises in the common law and to personify at law labor unions in an attempt to protect concerted activity by the working class in England.

In modern jurisprudence, however, no form of collective activity has caused more ink to be spilled in the debate over the nature of legal personality than the business corporation. Nowhere was the debate over the meaning of corporate personality as keenly debated in such a concentrated period as in the United States from the end of the second decade of the nineteenth century through the first third of the twentieth century. No mere academic dispute, the debate over corporate personality was framed by the twin considerations of society's power to promote and regulate economic activity on the one hand and the nature of collective activity, in this case entrepreneurial activity, on the other.

While English and American discussions of corporate personality existed before the nineteenth century, both in the common law and elsewhere, the first definitive exploration of the American position came in the Supreme Court's decision in *Dartmouth College vs Woodward*, 17 US 518 (1819). In that case Chief Justice John Marshall wrote that a corporation "is an artificial being, invisible, intangible, … possess[ing] only those properties which the charter of its creation confers upon it, either expressly, or as incidental to its very existence. These are such as are supposed best calculated to effect the object for which it was created." The declaration of the Chief Justice appeared to put the United States squarely in the camp of positive law insofar as corporate personality was concerned. Considering that elsewhere in American jurisprudence the legal personality of white male property-owning citizens was assumed, it is, however, quite clear that neither a belief in inherent legal personality nor a purely positivist vision animated overall American legal thought. Indeed, even within the realm of corporate personality both the case generally and Marshall's own opinion left room for both visions.

Despite the clear import of Marshall's language, the case held that the sovereign could not unilaterally alter the charter of its own creation when that creation was a private entity, which the college was. Even within the realm of positive law, therefore, Innocent's vision was subtly altered. The sovereign could, of course, reserve the power to alter charters it granted, and the chartering states quickly proceeded in that direction by legislative act. Nevertheless, even without recourse to the legislature, Marshall had left open the potential expansion of corporate personality by recognition of the necessary incidents of corporate existence.

Dartmouth itself was, of course, an educational and not a business institution. In the United States, however, the expansion of the economy and the entrepreneurial fervor of the citizenry meant that individuals looking for vehicles under which to organize their capital for business purposes quickly adopted the corporate form as their preferred mode. States, eager to accommodate, granted corporate charters in ever greater numbers. As the corporate form grew to be the natural mode for organizing capital, Marshall's supposition that corporations were 'artificial being[s]' grew ever more suspect. Rather than beings created by the state, they seemed creations of entrepreneurs. These creations, moreover, did not have simply the rights granted by the sovereign, but had whatever properties necessary to accomplish their object. Business existed in environments that required properties of great flexibility in order to operate and to achieve their object. They needed, among many other things for example, the right to own property, both real and personal, including intellectual property; they needed the right to operate across jurisdictional lines in order to better exploit markets for their products; they needed to be able to exploit resources in different jurisdictions, be they natural resources, pools of labor, sources of power or transport, or even pockets of capital. In addition to finding the elementary aspects of legal personality, such as the right to sue and to be sued, courts began to find other rights incidental to corporate existence. What is equally interesting is the tension between the legislature, which had the right to set the terms of a corporation's legal personality, and the courts, upon which fell the interpretive burden of discovering rights, which were incidental and through their discovery legitimating those rights. To be sure, legislatures often resisted granting certain rights and American courts moved in fits and starts in recognizing incidental rights, but the direction was clear. Marshall's qualification was, therefore, one of the ways in which the American jurisprudential image of the corporation reversed itself.

Well before the end of the nineteenth century, corporations asserted and courts recognized their changing legal personality. Though the object was clear, the protection of the property interests of the owners of corporations, the corporation's malleable legal personality was deployed as a jurisprudential weapon. At the time of the Dartmouth College judgment, corporations were rare, the state's imprimatur was thought to be useful in aggregating capital for risky and large ventures, and legislative consideration of corporate charters was real. A fictional understanding of the corporation's legal personality made sense, both to the state and to the individuals who sought a charter. By the last quarter of the nineteenth century, however, none of those conditions obtained. Corporations, especially business corporations, were common. Organizing entrepreneurial activity under corporate auspices was increasingly the norm. Capital markets had advanced to the point where the state's grant was largely irrelevant to the capacity to obtain capital and, as important, the state's stamp of approval was no longer felt to be necessary. Regulation of the behavior of corporations through their charters was largely nominal and the granting of charters was becoming an administrative rather than a legislative process. Indeed, the politics of regulation, always present, grew more contentious as the century progressed, especially as corporate activity made state and local regulation problematic. Regulation of behavior, regardless of legal form, increasingly became the norm and owners of corporations, in turn, sought to protect their property through new conceptions of corporate legal personality.

American legal treatises concerned with corporate law at first edged in the direction of abandoning the conception of the corporation as an entity with a legal personality of its own and instead made a brief attempt to see the corporation as the aggregation of the property of individuals and protected as would be the individual property of those individuals. Decades of jurisprudence dealing with corporate personality, the separation of owner and entity powerfully reinforced by the limited liability of corporate shareholders, and the willingness of courts to find an ever greater sphere of corporate rights suggested a different path. By the end of the century American jurisprudence, while still paying verbal homage to Marshall's understanding, had, in fact, begun to assume that many aspects

of a corporation's legal personality were inherent. Ironically, the American jurisprudence of corporate personality, which proved to be politically conservative, fed on many aspects of progressive jurisprudence. Maitland's writings on personification of the corporation, for example, though designed to help the aspirations of English labor as part of a larger jurisprudential vision, abetted an understanding of the naturalness of corporate rights in the United States. Indeed, the use of the term legal person to describe the corporation carried with it strong implications of a legal personality the equivalent of other persons.

In American jurisprudence the debate over the personification of the corporation exhausted itself in the years immediately prior to the World War II. In part the business corporation had achieved a legal personality sufficient for its needs and the needs of its owners. Further dispute on the reality and inherent content of a corporation's legal personality seemed irrelevant. Corporations existed and their legal rights and duties gave them sufficient flexibility to operate, flourish, and protect themselves. Simultaneously, attacks on general conceptions of rights by legal realists and others in favor of concepts of legal interests that society ought to recognize turned out to be just as hospitable to corporations in an environment that valued economic productivity more highly than much else. Nonetheless, the instrumental value of asserting an inherent legal personality was far from lost. In the last 1980s, for example, the United States Supreme Court recognized free speech rights of corporate bodies premised on the First Amendment of the Constitution, going so far as to characterize as 'extreme' the position that corporations have only the rights granted to them by states.

Legal personality, as the history of corporate personality demonstrates, is a jurisprudential tool with an independent significance. Without a legal personality, no person, entity, or thing may actively participate in a legal system. Once having obtained a legal personality, either by the assertion of an inherent personality and the recognition of that personality by the appropriate political bodies, or by the grant of personality from the sovereign, the content of the personality is plastic but the capacity to participate, even if limited, is clear. By right of participation, the avenue to enlarging the content of that personality opens itself up to assertions of right and instrumental value.

Legal Pluralism

John Griffiths, University of Groningen, Groningen, The Netherlands

Abstract

'Legal pluralism' refers to the coexistence of more than one regulatory order in a society. The term can be used in two ways. Juridical legal pluralism refers to the recognition by state law of the 'customary law' of particular groups, as in the case of colonial legal pluralism. Empirical legal pluralism refers to the situation in which the behavior of an actor is in fact subject to more than one set of rules. This article deals with the history of the empirical concept of legal pluralism, theoretical controversy it has engendered, and its use in various areas of empirical research.

The concept of legal pluralism refers in the most general sense to the "coexistence of different normative orders within one socio-political space" (Benda-Beckmann, 1997: p. 1). While recognition of the phenomenon has a longer history (e.g., Ehrlich, 1913; Gurvitch, 1935), its modern name only became common currency in the late 1960s and early 1970s: *legal pluralism* (Schiller, 1965; Hooker, 1975); *rechtspluralismus* (Benda-Beckmann, 1970), *pluralisme juridique* (Gilissen, 1971).

The concept plays a key role in modern sociology and anthropology of law and, to a lesser degree, in related disciplines such as the economic analysis of law (e.g., Ellickson, 1991) and (legal) history (e.g., Thompson, 1991; Arthurs, 1985). It is the most important contribution that anthropology of law has made to legal theory, demanding attention to unresolved questions concerning the concept of 'law,' the sources of law, and the relationship of 'law' to the nation-state (e.g., Ingber, 1971; Twining, 2009; Woodman, 1996). It can also be used in legal analysis, for example, in comparative law and conflict of laws (e.g., Michaels, 2009), in connection with the role of 'customary law' in legal development (e.g., Sheleff, 1999) and of the 'cultural defense' in criminal law (e.g., Renteln, 2004). In recent years, it has become a feature of studies of globalization and a new *lex mercatoria* ('global legal pluralism' – Michaels, 2009).

Juridical and Empirical Legal Pluralism

The concept of legal pluralism has two related but distinct meanings, depending on whether it is being used for purposes of legal analysis or of social scientific description and empirical theory (Griffiths, 1986). 'Juridical' legal pluralism refers to a possible characteristic of formal 'law' (of the state or some similar institution): a way in which a legal order that is in principle unitary can deal with cultural and other sorts of diversity in its population by providing (or recognizing) distinct rules and procedures for specific groups – indigenous peoples, ethnic and religious groups, local communities, merchants and other economic groups, etc. (Vanderlinden, 1971). In the case of juridical legal pluralism, there are different legal rules for different actors and situations, but (in principle) only one legal rule for a given actor in a particular situation. As F. von Benda-Beckmann (1997: pp. 1–2) points out, it was largely lawyers – scholars of Indonesian 'adat law' (of whom the most important is Vollenhoven, 1918–1933), and of African law (e.g., Allott, 1960, 1970; Morris and Read, 1972) – who laid the foundation for the later work of other lawyers (e.g., Vanderlinden, 1971; Hooker, 1975) – who in turn brought the term 'legal pluralism' into currency and made it available for anthropologists and others to use, albeit in a quite different sense.

That quite different sense is 'empirical' legal pluralism, which refers to a social state of affairs in which the behavior of an actor is subject to different and possibly conflicting behavioral expectations (e.g., when the rules that obtain among the participants in a particular economic activity differ from those of state law). Twining (2010) refers to this conception of legal pluralism as 'social fact' legal pluralism. Legal pluralism in this sense is not normative but descriptive. Seen as 'people's law,' it can be the subject of social romanticism, but there is nothing necessarily 'good' about it. As K. von Benda-Beckmann (2001: p. 40) has observed: "Taking legal pluralism seriously … is not the same as endorsing every [local] rule …. To take it seriously is to acknowledge that it is there, that it affects people's behaviour, and that it also affects the way legislation is implemented."

The remainder of this article is largely devoted to legal pluralism in the sense most relevant for the social sciences: the empirical sense.

History of the Concept

Legal pluralism has presumably always existed in all societies of any complexity. But recognition of the phenomenon as something deserving of specific attention required the rise of the modern nation-state and the notion that the state is the source of all law, properly so-called, and that law prevails over all other forms of regulation (see Ingber, 1971; see for the history of the concept of legal pluralism, Bergh, 1986; Rouland, 1988; Woodman, 1998; Michaels, 2009).

When Western European expansion began to take the form of colonization, this 'Westphalian' conception of law (Twining, 2009) confronted the existence of indigenous peoples with lawlike rules and institutions that could not simply be ignored. Largely for reasons of administrative convenience (e.g., 'indirect rule') and the 'ethical' concerns of enlightened lawyers like van Vollenhoven (1918–1933), the modern

conception of juridical legal pluralism as a form of governance was born. Colonial law incorporated by reference (some parts of) the preexisting 'laws and customs' of subjected peoples, rejecting others as 'repugnant' to morality and public order. Colonial legal pluralism brought forth a considerable body of law (legislation, case law, and legal doctrine) and an extensive legal literature (e.g., Morris and Read, 1972; Hooker, 1975).

The intellectual roots of the empirical conception of legal pluralism now prevalent in sociology and anthropology of law can be traced back to Ehrlich (1913) who insisted that the 'rules for behavior' that actually govern social interaction are the norms that constitute the 'inner order of the associations' of which a society consists – its 'living law' – whereas the law of the state consists of 'rules for decisions' addressed to courts and other legal decision makers, and often quite remote from everyday social practice. In his day, Ehrlich had little influence on either legal theory or sociology and anthropology. Gurvitch's (1935) pluralist theory of the sources of positive law – similar to Ehrlich in its insistence on "l'existence d'innombrables centres générateurs du droit, de foyers autonomes du droit [such as unions and factories, churches, decentralized public services, and so forth]" – met a similar fate.

But after the Second World War and the demise of Western colonialism, the gradual emancipation of anthropology from its focus on the colonial situation led to a fresh start in which 'legal pluralism' served as the rallying cry for a new approach to the study of law in society. Vanderlinden's essay '*Le pluralisme juridique: essai de synthèse*' marked the transition from preoccupation with the relationship between colonial law and local customary law to the realization that legal pluralism in the empirical sense is also characteristic of modern, industrialized societies. Vanderlinden first defined legal pluralism as "L'existence, au sein d'une société déterminée, de mécanismes juridiques différents s'appliquant à des situations identiques" (1971: p. 19). He later argued that it can better be defined with reference to the situation of the actor whose behavior is "governed by multiple and various regulatory orders" (1989: p. 153).

The conceptual apparatus required for further theoretical and empirical development was not complete with an encompassing conception of 'law' and an actor-centered conception of 'legal pluralism.' Discussions of the subject tended to assume that the entities that produce and enforce 'law' are 'corporate groups' such as the state, the Roman Catholic Church, business corporations, or politically organized 'tribes.' It was Moore (1973) who argued that the social locus of 'law' should be defined not in organizational but in processual terms: the generation and maintenance of rules of behavior. The social entities that do this she called 'semiautonomous social fields' and, however cumbersome the name she gave them (compare Homans', 1950, for an equivalent term, 'human group'), Moore's conception has proven highly influential in the subsequent history of the empirical conception of legal pluralism (cf Merry, 1988: p. 878).

Armed with such ideas about the nature of 'law in society,' legal pluralism came to seem ubiquitous: careful empirical study revealed it in the business world (Moore, 1973; Macaulay, 1963; Bernstein, 1992), in industrial and bureaucratic organizations (Macaulay, 1986), among rural neighbors (Ellickson, 1991), and so forth. Recently, the supranational arena (the European Union, international organizations, international trade, and economic globalization) has come to be recognized as an important locus of legal pluralism (see Michaels, 2009; Snyder, 1999).

In the 1970s, scholarly interest in legal pluralism became institutionalized. The most important international scholarly journal devoted to the field – the *Journal of Legal Pluralism* – was founded in 1969 as *African Law Studies*, reflecting in its name the still dominant influence of the juridical approach to (post) colonial law. By 1981, the empirical approach had become dominant, and the name was changed to reflect this. In 1978, the Commission on Folk Law and Legal Pluralism of the International Union of Anthropological and Ethnological Sciences was founded. It organizes regular international symposia, publishes books and proceedings, and since 2013 is the publisher (in cooperation with Taylor & Francis) of the *Journal of Legal Pluralism*.

The whole range of approaches to be found in the social sciences have their champions in the literature on legal pluralism: for example, feminism (e.g., Griffiths, 1997), Marxism (e.g., Fitzpatrick, 1980; Snyder, 1981b), and systems theory (e.g., Teubner, 1997). Most writing on legal pluralism has been done by Western scholars, but Chiba (1989) is a notable exception.

Theoretical Controversy

The juridical conception of legal pluralism – denoting a particular arrangement within a legal order (in particular, state law) – is generally accepted and has never been the subject of significant disagreement. The empirical conception, by contrast, has given rise to some controversy, in particular concerning the question whether 'law' can be said to exist separately from the state (or whether state 'law' and other 'laws' are fundamentally different) and whether it is possible to define 'law' in a purely empirical way (that is, without normative assumptions). See Tamanaha (1993, 2000), Roberts (1998), Woodman (1998), F von Benda-Beckmann (2002); Twining (2010). J. Griffiths (2005) has argued that the 'taxonomic' approach to the definition of law (as one type of the genus 'social control') is the root of the problem of an empirical concept of law and proposes to conceptualize 'law,' for social scientific purposes, not as a distinct type, but rather as a dimension of continuous variation in the degree of differentiation in social control.

Use of the Empirical Concept in Theory and Research

Legal Eclecticism

Colonial legal pluralism was characterized by the 'choice of law' approach: either state law or customary law applied to a given case, and if customary law was applicable, then it was either the law of group A or that of group B. Scholars working with the empirical conception of legal pluralism soon came to appreciate that actors with access to multiple sources of law construct relationships, conduct disputes, and form complex social institutions such as 'family,' 'property,' and 'international trade' eclectically, fashioning a patchwork composed of

bits and pieces of local and mercantile law, religious law, state law, and international law. Thus, property and inheritance relationships in Minangkabau combine elements of Indonesian law, local adat law, and Islamic law (cf Benda-Beckman, 1979) and the social security arrangements that people in developing countries construct for themselves include elements of state law and of customary and religious laws, and if they migrate to a Western country its formal social security arrangements get included in the mixture (Benda-Beckman et al., 1988). Similar legal eclecticism can be observed in the examples of legal pluralism in 'modern' and 'Western' settings mentioned in Section History of the Concept above.

Dispute Processes (Litigation and Adjudication)

One of the most active areas of empirical research and theory in which legal pluralism has played a central role concerns dispute processes. Legal pluralism is an important factor in understanding what people have disputes about, how disputes emerge in social life, what choices are made about how to deal with them, how they progress, what ultimately happens with them, and how the disposition of a particular dispute affects the way other people deal with similar problems. At all stages of a dispute, the existence of alternative norms, procedures, and institutions profoundly influences what happens. Exemplary studies are Santos (1977) on informal law and disputing in a Brazilian squatter settlement, Abel (1979) on patterns of court use in a situation of legal pluralism, Todd (1978) on disputing relationships and social status in a Bavarian village, Ellickson (1991) on cattle-trespass disputes between neighbors in rural California. K. von Benda-Beckmann (1984) has shown how 'forum-shopping' litigants make differential use of state and nonstate laws in different phases of a dispute, so that the execution of a court judgment, for example, may be regulated in practice by nonstate norms.

Abel (1974), Galanter (1981), and J. Griffiths (1983) have integrated the perspective of legal pluralism into general formulations of litigation theory.

Social Working

Research in both Western and non-Western settings has shown repeatedly that legal pluralism and the eclectic use of plural legal resources can be key to understanding the effects of the rules of state law (see, e.g., Collier, 1976). Until recently, for example, proponents of 'law and development' tended to see legal pluralism as an obstacle to efforts of the state to promote economic development. However, the common idea that the relationship between local law and state law is that the former generally frustrates the effectiveness of the latter is too simple (cf Tamanaha et al., 2012). As Moore (1973: p. 721) observed long ago, "the various processes that make informally generated rules effective are often also the immediate forces that dictate the mode of compliance or non-compliance to state-made legal rules" (for a striking example see Kagan and Skolnick, 1993 for the case of rules regulating smoking). State law often adapts and builds upon forms of regulation that have earlier emerged in, and are enforced by, local social fields. The Dutch experience with the regulation of medical practice surrounding death (Griffiths, 2000) is a good example of the process by which such self-regulation (in this case, by the medical profession) can be adopted as 'law' by legal institutions, but remain dependent on the social field of doctors for its interpretation and application in medical practice.

J. Griffiths has integrated the perspective of legal pluralism into a general theory of the 'social working' of legal rules, of which the key proposition is that "[I]t is not the legislator who determines when a legal rule will be followed in social interaction. It is society that determines when and to what extent it is regulated by law. And it does this in a highly self-regulated way" (Griffiths, 2003: p. 66).

Common Property

In a famous article dealing with the problem of the 'population explosion,' Hardin (1968) invoked the 'tragedy of the commons,' the supposed failure of the old institution of village commons to prevent overgrazing and consequent land degradation, although it would have been in the interest of everyone to limit grazing to the carrying capacity of the land. Hardin's Hobbesian argument was sound; collective goods such as common property, clean air, or a stable population cannot be maintained without regulation. But his reliance on the example of the village commons was misplaced, since in that case use-rights were recognized and effectively maintained over long periods. His mistake lay in confusing common property with 'open (that is, unregulated) access' and overlooking nonstate regulation and enforcement (cf Feeny et al., 1990).

In recent years, much attention has been paid to the maintenance, by nonstate regulation of access, of collective goods such as irrigation systems (e.g., Roth, 2011), hunting and fishery resources (e.g., Ginkel, 1989; Bavinck, 1996), and so forth (see generally Acheson, 2011).

Interaction of State and Nonstate Laws and Institutions

A fifth area of interest concerns the ways in which a situation of legal pluralism affects the various legal orders involved. A well-known example is the 'creation of customary law': the fact that when local law is 'recognized' by state law (as in the case of colonial legal pluralism), it must be ascertained and applied by noncustomary tribunals. In the process, a great deal of transformation takes place, so that the 'customary law' applied in state courts may have only a distant relationship to its supposed sources (Snyder, 1981a; Woodman, 1988). Although it has received less attention, the opposite transformation – the 'creation of state law' in 'indigenous' interactions – seems to be at least as important (cf Benda-Beckmann, 1989; Griffiths, 1999).

A related phenomenon is the effect on local political authority when it is incorporated into a (post)colonial system of government. Such incorporation brings with it notorious errors in the identification of indigenous authorities, the witting or unwitting attribution to them of various nonindigenous powers, the manipulation of indigenous processes of succession to high office, and so forth. The fundamental bases of legitimacy tend to be corrupted and indigenous mechanisms of control over political authority eroded. This is a central

theme in a number of studies of local political authority (e.g., Holleman, 1969; Owusu, 1970).

On the other hand, the relationship between state law and other 'regulatory orders' (to use Vanderlinden's expression) is not necessarily just one of reciprocal confusion and frustration. The literature on effective 'governance' (e.g., of fisheries and coastal systems) increasingly recognizes the potential importance of 'interactive governance,' in which the state enhances governability by working in tandem rather than at cross-purposes with other sources of binding rules (see Jentoft, 2011).

In South Africa, where section 211 of the Constitution recognizes customary law and 'traditional leadership' so long as they are consistent with the Constitution and with legislation that specifically deals with customary law, recent years have seen fascinating legal developments in the way the state and the courts deal with customary law. In the *Shilubana* case (2008 (9) BCLR 914 (CC)), the South African Constitutional Court held that the authorities of a 'traditional community' are empowered to make changes in its customary law, in particular to bring it into conformity with the requirements of the Constitution (the case involved a change in the eligibility rules for succession to the position of Chief, so that a woman could succeed). *En passant* the Court observed that the common law rules for identifying legally binding 'custom' do not apply to customary law in South Africa; customary law is 'living law' of the community concerned and current practice is more important to the legal status of an alleged rule than its historical pedigree. The Court's judgment refers extensively to earlier decisions.

Surveys

Useful surveys of the literature on legal pluralism include Schiller (1965), Merry (1988), Rouland (1988), Woodman (1998), Michaels (2009), and Twining (2010).

Legal Positivism

Brian Z Tamanaha, Washington University in St. Louis, St. Louis, MO, USA

Published by Elsevier Ltd.

Abstract

Legal positivism is the label attached to a widely accepted, although hotly disputed, theory about the nature of law. This article describes how legal positivism developed by way of contrast to natural law theories of law. The core elements of the legal positivist view are then set out, with a discussion of the main disputes among legal positivists and the main criticisms of legal positivism. The final section discusses the relationship between legal positivism and social scientific approaches to law.

Legal positivism is the label attached to a widely accepted, although hotly disputed, theory about the nature of law. Within jurisprudence, legal positivism is most often discussed by way of contrast to natural law theories of law. The contest between these rival traditions has long dominated the discussion in legal philosophy, although there are signs that the debate may have run its course. Because legal positivism originated as a reaction to natural law theories about law, the best way to understand legal positivism is through this debate. The following section will describe the nature of the debate; the section thereafter will set out the core elements of legal positivism; and the final section will discuss the reaction to, and significance of, legal positivism, from the standpoint of social scientific approaches to law.

The Debate between Legal Positivism and Natural Law

Ironically, Hobbes, who is widely credited to be the early progenitor of legal positivism, built his positivistic theory of law on a natural law base (Bobbio, 1993; Fuller, 1940). According to Hobbes, the necessity for peace and order is the fundamental precept of natural law. Given that the state of nature is, in his immortal phrase, "solitary, poore, nasty, brutish, and short", people join together and give over law-making and enforcing power to a Sovereign for the purpose of maintaining peace and order (Hobbes, 1946: Chaps. XIV, XV). Thereafter, law consists of the commands of the Sovereign. Although the Sovereign is to be guided by reason in the establishment of law, even unjust commands are valid laws; to suggest otherwise would invite the disorder that will result if people were allowed to apply their own judgment to evaluate the law. Under Hobbes' formulation, while natural law provides the initial foundation for positive law, once that foundation is established, natural law becomes irrelevant. It does not provide a continuing standard or test for the validity of the law (*see* Natural Law; Justice and Law; Injustice: Legal Aspects).

This conclusion raises the issue that has long set legal positivists and natural law theorists at odds. Thomas Aquinas, citing Augustine, asserted that "A law that is not just, seems to be no law at all" (Q. 96, A. 4, Obj. 3). "Consequently every human law has just so much of the nature of law, as it is derived from the law of nature. But if in any point it deflects from the law of nature, it is no longer a law but a perversion of law" (Q. 95, A. 2, Obj. 4). A similar statement was made by William Blackstone. "[N]o human laws are of any validity, if contrary to this [law of nature]" (Boorstin, 1996: p. 49). More recently, Lon Fuller asserted that there is a minimum moral element to law, without which it is "not simply bad law, but not law at all" (Boorstin, 1999: p. 197).

Legal positivists are adamantly opposed to this position. Austin, who produced the first widely influential articulation of the legal positivist position, wrote a scathing response to Blackstone. "Now, to say that human laws which conflict with the Divine law are not binding, that is to say, are not laws, is to talk stark nonsense. The most pernicious laws, and therefore those which are most opposed to the will of God, have been and continually are enforced as laws by judicial tribunals" (Austin, 1995: p. 158). "The existence of law is one thing; its merit or demerit is another." What law *is*, and what law *ought* to be, legal positivists insist, are separate questions. This is known as the separation thesis.

Aside from the general confusion it engenders, the failure to maintain the separation between *is* and *ought* raises two particular political concerns for legal positivists (Hart, 1958: pp. 597–598). The first concern involves a person who concludes, based on his or her understanding of natural law, that a particular immoral law is invalid and, therefore, can be freely disregarded. An example of this is the radical antiabortionist who invokes natural law to justify shooting doctors who perform abortions on the grounds that laws allowing abortion are invalid because they condone the killing of innocent lives. The second concern is that the identification of law with morality will lead people to be less critical of the law, their vigilance softened by the seductive assumption that the law *is* what it *ought* to be. Many legal positivists believe that the fact that a norm has valid legal status does not of itself give rise to an obligation to abide by the law (Schauer, 1996). Keeping apart law and morality in this fashion allows us to more critically evaluate the law from a moral standpoint. These two concerns, while not contradictory, point in opposite directions: the first worries about people choosing to disregard the law on the grounds that it is invalid, while the second worries about people slavishly following the law because they assume it is necessarily morally worthy.

The second concern, more so than the first, animates many legal positivists in their dispute with natural law theorists, and their concern is not a purely abstract one. In the aftermath of World War II, some legal theorists blamed the legal positivist

separation of law and morality for the failure of the German legal establishment to resist atrocities committed by the Nazi government through law (Hart, 1958: pp. 615–621; Rommen, 1998). The view that 'law is law' regardless of its immorality, according to Gustav Radbruch, led the German legal profession to be completely subservient to state legal power. The legal positivist response – besides pointing out the lack of empirical support for the asserted causal connection – is that the separation of law from morality has the effect of *reducing* the prestige of law, thereby exposing it to greater moral critique. Under this view, the fact that a pronouncement is valid law carries little weight, and an immoral law should be resisted. If the German legal establishment failed to resist immoral laws, therefore, it was not the fault of legal positivism.

The longstanding debate between legal positivists and natural law theorists is a narrow one. Legal positivists argue that a law can count as valid law, even when it is immoral. Nevertheless, they immediately assert that a valid law or legal system can and should be evaluated from a moral standpoint, and not considered obligatory if found wanting. Many natural law theorists, on their part, have asserted that consistency with natural law is a condition of the validity of positive law. An immoral law is, therefore, not 'law' at all, and carries no obligation (except perhaps when a greater good might be served by adherence to a bad law). However, anything that qualifies as law pursuant to this understanding automatically generates an obligation to comply because it has already met a moral test. Whichever direction one approaches from, in the end, both sides agree that an immoral positive law generally does not give rise to an obligation to obey.

After generations of disagreement, there are a few signs of a rapprochement. John Finnis, the most influential modern exponent of natural law theory, argued that Aquinas was actually an early legal positivist, in the sense that he recognized that immoral laws were still in fact 'laws,' albeit deviant or deficient forms of law (Finnis, 1980, 1996). A leading legal positivist, Neil MacCormick (1992), has acknowledged that there are certain respects in which law or legality contains moral qualities, although this does not vitiate the separation thesis. If natural law theorists, like Finnis, are willing to acknowledge that an immoral law is still 'law' in positive law terms – a point that a number of natural law theorists have not actually contested – the original basis for the dispute dissipates (although a different opposition arises in relation to Dworkin, addressed shortly).

To be sure, not everyone agrees that the debate is over, but the bulk of the discussion of late has shifted to other matters, away from the issue of legal validity. One aspect of this classical debate remains unresolved, however. Although it has attracted relatively little attention, it is of continuing relevance and bears mention. The primary focus of the debate has been on whether immoral laws are invalid; the reverse question this raises is whether natural law principles have the status of law even if not affirmatively recognized by positive law. If the answer is yes, then the Nuremberg Trials, and more recently the trials of the German border guards prosecuted for shooting people attempting to escape former East Germany, involved the application of preexisting natural law principles with direct legal effect. If the answer is no, then these trials can be condemned as impositions of power by the ultimate victors in a political battle. Furthermore, if the answer is no, a strong argument can be made that these trials themselves violated the natural law prohibition against the *ex post facto* imposition of law, criminalizing and punishing behavior that was not illegal at the time it was committed. The issue of the legitimacy and legality of these kinds of actions, with serious unresolved moral as well as practical implications, will continue to arise as long as there are attempts to subsequently hold government officials legally responsible for conduct that was not illegal under the positive law when they engaged in their actions.

The Core Elements of Legal Positivism

As with every theoretical tradition, there are many varieties of legal positivism. Of late, as the dispute between legal positivism and natural law has moderated, internal divisions within legal positivism have taken center stage in the theoretical discussion. The nuances of the internal debate need not be explored. It takes place within shared parameters that characterize most legal positivists, and these parameters are what matter. There have been two dominant versions of legal positivism in the twentieth century, the first by Hans Kelsen and the second by H.L.A. Hart. The essential difference between the theories lies in their orientation (Bix, 1996: Chap. 6). Kelsen constructed an abstract system of norms (Kelsen, 1967), whereas Hart built on social practices. The focus in this discussion will be on Hart's version, which has proven more influential (at least outside the European Continent), but a few words will be said about Kelsen's approach.

Kelsen's 'pure theory of law' focused exclusively on law as a system of norms – separate from issues of justice (natural law) and from how people actually behave in connection with law (sociological jurisprudence) (Kelsen, 1961). Law is a normative system that contains its own rules for the creation and application of norms, and prescribes coercive sanctions for violations of its norms. It is a hierarchical system in which higher norms govern the content and creation of lower norms, and unity of the legal order rests upon a basic norm or *Grundnorm*. Initially, Kelsen asserted that the basic norm that grounds the unity of the system must be *presupposed* – it cannot be enacted because that would require a higher authority, which threatens an infinite regress – but in later writings, he suggested that the idea of the basic norm is a *fiction* (Paulson, 1992). His theory merged the law and the state: "One of the distinctive results of the pure theory of law is its recognition that the coercive order which constitutes the political community we call a state, is a legal order" (Kelsen, 1961: p. 64). Although Kelsen has devoted supporters, the daunting complexity of his pure theory of law, combined with questions about whether his late shift in view gutted what made his theory unique, has limited the broader influence of his version of legal positivism.

Hart's *The Concept of Law* (1961) is the single most important legal positivist text, and probably the most influential book in the field of jurisprudence in the second half of the twentieth century. Hart's project was to produce "a theory of what law is which is both general and descriptive" (Hart, 1994: p. 239). His theory was 'general' in the sense that he intended

to clarify the nature of law as a social phenomenon found in many different cultures and societies, by way of contrast to a 'particular' jurisprudence, which is focused on a specific legal system. His text was 'descriptive' in the sense that he eschewed evaluative analysis, limiting himself to describing practices and clarifying concepts related to law. He characterized his standpoint as that of an external observer describing the ways participants engage in and understand law from an internal point of view. To emphasize his orientation, Hart described his book as "an essay in descriptive sociology" (Hart, 1961: p. v).

According to Hart, a legal system consists of the union of what he called primary and secondary rules. Primary rules are the rules that govern relations within society. Secondary rules are the rules legal officials follow to identify, apply, and change the primary rules. Hart labeled the core secondary rules the 'rules of recognition,' "which specify some feature or features possession of which by a suggested rule is taken as conclusive affirmative indication that it is a rule of the group to be supported by the social pressure it exerts" (Hart, 1961: p. 92). Norms created in accordance with the rules of recognition thereby obtain legal status. According to Hart, the emergence of secondary rules is what separates prelegal (or primitive) societies from societies with law. Although simple societies with only primary rules can exist, they are static and inefficient in responding to new situations or bringing about the desired change. The availability of secondary rules cures these defects.

In his dual division, secondary rules identify primary rules; the remaining question is how to identify secondary rules. Hart's answer to this – in contrast to Kelsen's *Grundnorm* as the ultimate source of all other norms – is that the rules of recognition can be identified by observing the *actual social practices* of legal officials when they identify law. The existence and nature of the rules of recognition in a given legal system is thus 'a matter of fact.' Law is whatever legal officials recognize as law in their social practices, with no content restrictions on what that might be.

Hart concluded that there are two minimum conditions necessary and sufficient for the existence of a legal system. The first condition is that the primary rules must be generally *obeyed* by the populace (it is not essential that the populace normatively embrace the primary rules, although that is ideally the case). It does not make much sense to say that a legal system exists if the bulk of the populace generally disregards it. The second condition is that the legal officials normatively accept the secondary rules as critical standards for their behavior. Hart added this requirement to distinguish law from mere habits of obedience, and from the 'Gunman Writ Law,' which was the impression left by John Austin's command theory of law. Hart felt that the coercive view of law failed to recognize that law contains a normative aspect. This normative aspect, according to Hart, can be recognized if one takes into consideration the internal point of view of legal officials. Seen from the internal perspective, legal officials *accept* the secondary rules as "common standards of official behavior and appraise critically their own and each other's deviations as lapses" (Hart, 1961: p. 113). Consistent with his nonevaluative stance, Hart specifies that officials must accept the secondary rules without suggesting whether this acceptance is merited (which can only be determined by examining particular legal regimes). When the primary rules are generally obeyed by the populace and the secondary rules are accepted by the legal officials, a legal system will exist.

With its simplicity, clarity, elegance, and scope, Hart's reconstruction revitalized legal positivism and spawned an enormous response, in support and against. Most legal positivists (in the Hartian tradition) adhere to two core theses about the nature of law: the Separation Thesis and the Social Sources Thesis. The Separation Thesis holds that there is no necessary relation between law and morality (Coleman, 1982, 1996). The genesis of this thesis has already been identified in the earlier described insistence of legal positivists that the fact of legality alone does not carry with it the imprimatur of moral rectitude. It is important to see that this is a limited, negative thesis, a denial of the natural law position, rather than an affirmative statement of the typical relationship between law and morality. Legal positivists do not contend that there are no connections between law and morality, only that there is no *necessary* connection. They recognize that the "law of every modern state shows at a thousand points the influence of both the accepted social morality and wider moral ideals" (Hart, 1961: p. 199). This influence comes in a myriad of ways. Law and legal norms often reflect (or claim to reflect) the morality of their community. Legal norms often expressly refer to and incorporate moral principles like justice, fairness, reasonableness, and due process. Law often has positive moral consequences, especially in maintaining order in society. Law also participates in the moral education of members of the community. Recognition of these important connections between law and morality is consistent with the Separation Thesis. Stated at the most abstract level, the Separation Thesis claims only that a legal system can be imagined to exist in which morality is not a condition of legality. At a more practical level, the Separation Thesis insists that it is not necessarily the case that a moral norm automatically becomes a legal norm, and that it is not necessarily the case that an immoral law is devoid of legal validity.

The Social Sources Thesis holds that what is or is not valid law in a given system is a social fact, as determined in accordance with the rules of recognition. By observing the practices of the legal officials within a legal system, it will be possible to identify the criteria applied by the legal officials to determine valid law. In many legal systems, these practices include treating legislative enactments and judicial precedents as valid sources of law.

Although legal positivists share these two theses, there is a substantial internal divergence among legal positivists about what they stand for and allow or disallow. Much of the internal disagreement has been generated by efforts by Hart and other legal positivists to respond to the sustained critique of legal positivism by Ronald Dworkin. This complex internal and external debate cannot be recounted here, although its core themes can be articulated summarily.

Dworkin has attacked Hart at several different levels and points (Dworkin, 1977, 1985, 1986). He denies the very possibility or value of general, purely descriptive jurisprudence. Dworkin insists that jurisprudence itself is an aspect or extension of the law of a particular legal system and must, therefore, be conducted from the particular, internal perspective, which is inherently evaluative in orientation. Dworkin denies the Separation Thesis by arguing that law and morality are

inextricably intertwined, with moral principles providing an integral backdrop for the interpretation and application of legal rules. Law incorporates a large body of the community's moral principles; with the inclusion of these background principles, he claims, law always provides a single correct answer to legal problems. Dworkin further argues that the social practice aspect of Hart's rules of recognition fails to accurately describe our own legal system, which expressly incorporates moral norms (like fairness) in a manner that renders the identification of the primary rules dependent on difficult and controversial questions about the truth of moral norms. He identifies two specific problems with Hart's notion of rules of recognition. First, rules of recognition are incapable of identifying all of the many and varied moral norms and principles incorporated into the law. Second, Dworkin insists that legal positivists, consistent with the requirements of their own theory of law, cannot accommodate the incorporation of such norms and principles for this reason: making law contingent upon the resolution of complex moral questions (as Dworkin says does occur) would defeat legal positivists' claims that the identification and meaning of legal rules can be determined in ways that avoid uncertainty and provide guidance to the populace.

This is an abbreviated recitation of Dworkin's criticisms of Hart and legal positivism, but it suffices for these purposes. Some of the issues separating Hart and Dworkin can be resolved, or at least avoided, by recognizing that Hart was focused on the legal system as a whole, while Dworkin focused primarily on judging, and that general and particular jurisprudence are two different enterprises which need not necessarily conflict. The most significant controversy relates to the extent to which rules of recognition can refer to open-ended moral questions to determine the content of law (rather than just social practices). Hart insists that there are no restrictions on rules of recognition that prohibit a particular legal system from turning the identification of law on the resolution of moral issues, as long as that is what the actual social practice in a given system requires. Hart labels his view 'soft positivism' (or 'inclusive' legal positivism) (Hart, 1994: pp. 250–254; Coleman, 1998). Against Dworkin's claim that this defeats the point of legal positivism, Hart (1994: p. 251) responds that positivism tolerates a certain degree of uncertainty, and resort to moral standards would not necessarily result in an excessive amount of uncertainty.

In theory, inclusive legal positivism would still be a correct description of a legal system that has only a single rule of recognition which says this: do justice (Coleman, 1998). Taken this far, it is no longer evident, as with the debate between natural law and legal positivism, that anything of great moment rests upon the resolution of the debate between inclusive legal positivists and Dworkin – for both allow the substantial incorporation of moral principles (albeit construed differently). Contrary to Hart and other inclusive legal positivists, however, there are 'hard' or 'exclusive' legal positivists, led by Joseph Raz, who do not concede Dworkin's position about the inclusion of open questions of morality within law (Raz, 1979). Now much of the debate is an internal one between inclusive and exclusive legal positivists (Bix, 1999; Leiter, 1998; Coleman, 1998). Although hard positivists recognize that the law often refers to such norms, they assert that at that moment the law runs out and the judge's decision is based on extralegal considerations. The moral considerations to be resolved are not a part of the preexisting law before the issue is decided, although they can thereafter become law if recognized and treated as legal precedent (consistent with the applicable rules of recognition). Hard positivists believe it is essential to take this position if legal positivism is to satisfy its claims that the function of law is to provide guidance to the public on the rules of conduct, and if law is to claim independent authority, apart from morality.

Once again, it would appear that the issue that divides the disputants is a relatively narrow one. Neither side denies that often the law refers to moral norms (like justice and fairness) which turn on the resolution of issues of substance or content. At that point the inclusive legal positivist says the judge is still doing law, while the hard legal positivist says that the law has run out. This is not to suggest that the debate is insignificant. When considering these issues, legal philosophers are attempting to come to an understanding of the nature of law. As with several of the debates discussed above, the resolution will not be found in resort to the facts, for these are conceptual or analytical disagreements over the best way to understand law from a theoretical standpoint.

Legal Positivism and Social Science

Legal positivism generally, and Hart's theory in particular, has an ambivalent relationship with the social sciences. Even what might seem like an obvious connection – use of the label 'positivism' – is not free of ambiguity. The term positivism literally refers to the fact that law is 'posited,' a human social creation. Some legal theorists assert that there is no direct connection between legal positivism and scientific positivism (Patterson, 1953: p. 15; Posner, 1990: p. 20); others suggest that the connection lies in the shared insistence on the distinction between *is* and *ought* (Schauer, 1996: p. 49). Still others insist that there is a strong connection, grounded in a shared empiricist narrowing of reality, the need for certainty (Rommen, 1998: pp. 109–113), and a shared opposition to theological and metaphysical modes of thought (Lee, 1989: pp. 16–18). Hart himself invoked social science. As noted earlier, he described his book as an essay in descriptive sociology, although legal philosophers have since distanced themselves from this claim. Furthermore, in his discussion of the internal aspect of rules, Hart acknowledged Peter Winch's *The Idea of a Social Science* (1958), and he has been lauded for importing the hermeneutic perspective from social science into jurisprudence.

Hart's theory has been criticized from certain social science quarters. A standard criticism is that Hart made a host of putatively descriptive sociological claims about law without having first done the requisite sociological investigation (Cotterrell, 1989: pp. 94–106). An anthropological critique of Hart focuses on the fact that his concept of law was abstracted from state legal systems, which leads to the conclusion that certain societies – those lacking in secondary rules – did not have law, suggesting that they are primitive or less civilized (Roberts, 1979: pp. 23–25). This smacks of ethnocentric privileging of Western legal systems. Social scientists who

hold the belief that "no society is without law" (Moore, 1978: p. 215) must reject Hart's concept of law. A third criticism, aimed at legal positivism more generally, is that legal positivist views tend to mask the social reality that there are a plurality of 'legal' systems operative in society, not just the state legal system that legal positivism emphasizes (Griffiths, 1986).

Despite these criticisms, Hart's concept of law has had a significant, if mostly underground, influence in social scientific approaches to the concept of law. Paul Bohannan's widely followed anthropological definition of law as the reinstitutionalization of norms bears a strong resemblance to Hart's notion of primary and secondary rules (Bohannan, 1965). Marc Galanter, one of the leading theorists of legal pluralism, adopts Hart's concept of law to distinguish legal from nonlegal forms of social regulation (Galanter, 1981: pp. 18–19, n. 26). Since it was abstracted from the state model, Hart's concept of law is attractive because it comports with general intuitions about law in the modern world. Whichever concept of law one formulates, it must be derived from a preconception about what law is (Tamanaha, 1993, 1995).

Although analytical jurisprudents have become excessively abstract of late, the legal positivist ambition to construct a general and descriptive approach to law is one the social sciences should embrace (Tamanaha, 2012). Law and society scholars have been building upon strains of legal positivism to take up issues like legal pluralism and the spread and penetration of law through globalization (Twining, 2009). Social scientists can conduct the sociological studies Hart failed to complete, using his model of law as the union of primary and secondary rules to guide their research, without necessarily accepting the separate propositions that this is the best or only way to characterize and understand law. With adjustments, a sociological or 'sociolegal' version of positivism has the potential to provide information about the relationship between law and society and to establish a bridge between jurisprudence and the social scientific study of law (Tamanaha, 2001).

Legal Process and Social Science: United States

John Monahan, University of Virginia School of Law, Charlottesville, VA, USA

Abstract

The use of social science in American courts is rooted in the legal realist movement of the early twentieth century. However, the standard for the admissibility of scientific evidence was not established until the Supreme Court's decision in Daubert v. Merrell Dow Pharmaceuticals in 1993. Social science evidence has three uses in court: to assist judges in making general law, to assist juries in determining specific facts, and to provide juries with general context for determining specific facts. At the beginning of the twenty-first century, efforts to educate judges in social science methods are burgeoning.

Introduction

There are two complementary orientations in the field of 'law and social science' in the United States. The first, usually called the 'law and society' approach, addresses theories of how law comes into being and changes in a culture. The second, referred to as the 'social science in law' approach, deals with more applied questions of how courts and juries make use of social science information in legal cases. This article is concerned with the latter orientation. It posits that social science has three uses in American courts: to assist juries in determining specific facts, to assist judges in making general law, and to provide juries with a general context for determining specific facts. At the beginning of the twenty-first century, rapid developments in the law of scientific evidence are taking place, and efforts to educate judges and lawyers in scientific methodology are burgeoning.

Jurisprudential Roots of Social Science Evidence in American Law

Since the rise of legal realism early in the twentieth century, American courts have, to varying extents, been open to using social science research when that research could help resolve an empirical issue that arose in litigation. Social science research was first urged upon a court in 1908 by Louis Brandeis in Muller v. Oregon (208 U.S. 412), a landmark case dealing with the constitutionality of social welfare legislation limiting to 10 h workday of any woman or girl employed in a factory or laundry. Brandeis assembled a substantial body of social science research tending to show the debilitating effect on women and girls of working long hours, and he presented this material to the US Supreme Court in a brief defending Oregon's statute. In the opinion in the Muller case upholding the legislation, after referring to the social science materials in a footnote, the Court stated that although they 'may not be, technically speaking, authorities,' the studies would nonetheless receive 'judicial cognizance.'

Modern Standards of Admissibility for Social Science Evidence

The US Supreme Court has articulated detailed standards to regulate the introduction of scientific evidence in court. In the 1993 case of Daubert v. Merrell Dow Pharmaceuticals, Inc. (509 U.S. 579), the Court held that judges should not simply defer to members of a scientific discipline when deciding whether to admit expert testimony. Trial judges are to be evidentiary gatekeepers. They have the responsibility to assess for themselves the validity of the methods underlying expert evidence. With Daubert, a judge's responsibility changed from merely assessing the degree of consensus in a field – the 'general acceptance' test articulated in the 1923 case of Frye v. United States (54 App. D.C. 46) – to evaluating the research methods and the analyses that lay behind expert opinion. In 2011, the Federal Rule of Evidence (Rule 702) dealing with testimony by expert witnesses was rewritten as follows to reflect Daubert:

> A witness who is qualified as an expert by knowledge, skill, experience, training, or education may testify in the form of an opinion or otherwise if:
>
> (a) the expert's scientific, technical, or other specialized knowledge will help the trier of fact to understand the evidence or to determine a fact in issue;
> (b) the testimony is based on sufficient facts or data;
> (c) the testimony is the product of reliable principles and methods; and
> (d) the expert has reliably applied the principles and methods to the facts of the case.

Daubert is now the accepted test of admissibility for scientific expert testimony not only in all federal courts but also in the courts of many states. Together with its subsequent rulings in 1997 in General Electric Co. v. Joiner (522 U.S. 136) that an appellate court owes deference to a trial court's decisions on the admissibility of scientific evidence, and in 1999 in Kumho Tire v. Carmichael (526 U.S. 137) that a court's gatekeeping responsibilities extend to all expert testimony, not just to expert testimony by scientists, the Supreme Court's decision in Daubert shifted the judicial paradigm for dealing with expert evidence.

Three Uses of Social Science in Law

Although the use of what came to be known as 'Brandeis briefs' became common in the years after Muller, legal commentators

were hard pressed to explain an apparent anomaly: How was it that Brandeis could present research to an appellate court in a written brief, when 'facts' were supposed to be introduced at the trial level by the oral testimony of witnesses? This conundrum persisted until Kenneth Culp Davis, in a seminal article published in 1942, distinguished two types of 'fact.' The first type, which he called adjudicative fact, referred to facts that were used to decide questions of interest only to the specific parties to a lawsuit, such as whether a particular traffic light was red or green. The second type, which he called legislative fact, referred to facts that were used by courts to help decide broad questions of law or policy, as Brandeis had used research to help decide the constitutionality of social welfare legislation. Davis's distinction soon became widely accepted and now forms the traditional scheme used by courts and commentators to describe the judicial uses of social science. In addition, there are strong indications that a third use of social science in American law – combining aspects of both legislative and adjudicative facts – has developed.

Social Science Used to Make Law

Many of the uses of social science research to support the creation of new law, or a change in existing law – what Davis (1942) called 'legislative facts' and what others have conceptualized as 'social authority' (Monahan and Walker, 1986) – have been in the area of discrimination. For example, the first modern use of social science in racial discrimination cases occurred with the citation in Brown v. Board of Education (347 U.S. 483 (1954)) to the famous 'doll study,' finding that African-American children in segregated schools preferred to play with a white doll rather than a black doll. Courts still often cite social science research in racial discrimination cases, but now it is often cited to oppose affirmative action on the basis of race. For example, in 2007, in the case of Parents Involved in Community Schools v. Seattle School District No. 1 (551 U.S. 701), a more conservative US Supreme Court held that a school board's act of voluntarily taking race into account to achieve racial balance violated the US Constitution. Chief Justice John Roberts wrote for the 5-4 majority that "The way to stop discrimination on the basis of race is to stop discriminating on the basis of race." In his concurring opinion, Justice Clarence Thomas cited 10 social science studies and literature reviews. The dissent by Justice Stephen Breyer cited another 10 social science studies and literature reviews to support the contrary conclusion that "to invalidate the plans under review is to threaten the promise of Brown."

Unsurprisingly, the law of gender discrimination has changed much more than the law of racial discrimination in recent decades, and is still highly unsettled. In the 1996 case of United States v. Virginia (518 U.S. 515), the US Supreme Court overturned a lower court finding that "a substantial body of contemporary scholarship and research supports the proposition that … females and males characteristically learn differently." The Supreme Court held that the justification for classifications based on gender 'must not rely on overbroad generalizations about the different talents, capacities, or preferences of males and females,' and that denying qualified women the right to enroll in a state-supported military academy violated the Constitution. Whether gender segregation in public elementary schools (e.g., all-girl mathematics classes) similarly violates the Constitution, however, has yet to be decided by the Supreme Court.

The death penalty is another area in which social science has been used to make law that has been transformed in recent years. In 1976, for example, Gregg v. Georgia (428 U.S. 153) cited many social science studies on the deterrent value of the death penalty, only to conclude that 'the results simply have been inconclusive' and that deterrence is 'a complex factual issue the resolution of which properly rests with the legislatures.' Since Gregg, major cases have found that 'death-qualified juries' are not so inherently biased toward the prosecution that they violate the fair cross-section of the community and the impartiality requirements of the Constitution (Lockhart v. McCree, 476 U.S. 162 (1986)), and that the administration of the death penalty does not violate the Equal Protection Clause of the Constitution, even if the death penalty is disproportionately imposed on murderers whose victims are white (McCleskey v. Kemp, 481 U.S. 279 (1987)). Each of these cases contained extensive citations to social science research, usually by the dissenting justices. Other Supreme Court decisions, however, hold that it does violate the Constitution to execute an offender who was younger than 18 years old when he or she committed a capital crime (Roper v. Simmons, 543 U.S. 551 (2005)), and that the Constitution likewise prohibits imposing the death penalty on a person convicted of child rape in which the child was not killed (Kennedy v. Louisiana, 554 U.S. 407 (2008)). Both of these cases also contained extensive citations to social science research. But in these decisions, the citations to social science research were usually by justices in the majority.

Jury size is yet another area on which social science research has been brought to bear. In Ballew v. Georgia (435 U.S. 223 (1978)), the Supreme Court – citing a great deal of social science research – declared Georgia's five-person criminal juries to be below the constitutional minimum. Thirty years later, a distinguished group of academics from law and the social sciences filed an amicus brief with the Supreme Court arguing that Ballew combined "erroneous empirical factfinding with mistaken history, producing an incoherent statement of the law which should be troubling to legal theorists of various perspectives—originalists, empiricists, and doctrinalists alike." The authors of the brief urged the Court to reconsider their decisions on jury size. The Court, however, declined to do so (Gonzalez v. Florida, 555 U.S. 1056 (2008)).

Social Science Used to Determine Facts

Adjudicative facts – also called 'social facts' – are facts that apply only to the particular parties before the court. They are used to determine (or 'adjudicate') what happened in a specific case, and not for some larger purpose, such as to argue that the law should be changed. One of the most frequent uses of social science research as adjudicative fact involves trademarks. The Lanham Trademark Act (15 USCA Sec. 1127) states that a new trademark will not be registered if it so resembles

a trademark already registered to another person "as to be likely … to cause confusion." A person who sells a product that is likely to cause confusion with an already trademarked product is liable for trademark infringement. Social science research in the form of surveys of consumers or potential consumers to ascertain the degree of confusion between products has been admitted in court for many decades. Initially, such evidence was often successfully challenged as contravening the prohibition against 'hearsay' evidence, since the respondents to the surveys were not present in court to testify. In Zippo Manufacturing Co. v. Rogers Imports (216 F. Supp. 670 (1963)), however, the hearsay objection was definitively laid to rest: "The weight of case authority, the consensus of legal writers, and reasoned policy considerations all indicate that the hearsay rule should not bar the admission of properly conducted public surveys."

The use of empirical research to determine consumer confusion in trademark law is well illustrated by Pharmacia Corp. v. Alcon Laboratories (2002). Pharmacia had registered the trademark Xalatan as its name for a prescription medication to treat the eye disease glaucoma. Pharmacia sued Alcon Laboratories for using the name Travatan for the glaucoma medication that Alcon produced, alleging that consumers would be confused between the two names. Alcon introduced Professor Shari Seidman Diamond as an expert witness. She testified to having conducted a true experiment in which ophthalmologists and optometrists (who, the court found, "make the ultimate determination as to which medications pharmacists will dispense and end-users—patients—will receive") were questioned after having been shown advertisements for Travatan or for a control medication. The court found that Diamond's research 'demonstrates persuasively a confusion rate of 1.5%,' and that such a low rate of confusion did not justify a preliminary injunction prohibiting Alcon from using the name Travatan.

The use of empirical methods to determine whether consumers are confused between two products has become so routine that the failure of a trademark owner to conduct a study often gives rise to an adverse inference by courts: if no survey is introduced, the likely reason is that there is no confusion to be found. In-person surveys of consumer confusion have been widely admitted in trademark cases since Zippo in 1963. Web-based trademark surveys, unsurprisingly, have been admitted in court only recently, but clearly seem the wave of the future.

The key to understanding how courts deal with social science research used to determine an adjudicative fact is that, unlike 'legislative' facts, adjudicative facts are susceptible to proof by the usual rules of evidence. Evaluating the research for the purpose of admissibility is limited to determining whether it is material, whether it has any probative value, and whether its admission violates any other evidentiary rule. The ultimate weight to be placed on the social science evidence is a matter for the fact finder.

Social Science Used to Provide Context

Most of the judicial uses of social sciences fall into one of the two categories originally described by Davis. In recent decades, however, courts have begun to confront uses of social science research that do not conform to the established classification. There are increasing indications that a third use of social science in law has emerged in which 'general' social science research is used to provide a context for deciding specific factual issues in a case – a use that was proposed by Walker and Monahan (1987) and termed 'social frameworks.' One can organize courts' use of social frameworks as applied to criminal defendants in a temporal sequence: the identification of people who will act illegally in the future, of people who are presently acting illegally, and of people who have acted illegally in the past.

The use of social science research to identify future legal actors is manifest in cases dealing with whether risk assessment tools developed by social scientists could be used to assist in making bail or parole decisions. Not only is there no longer a question as to whether denial of bail can constitutionally be predicated on violence risk assessments – as the Supreme Court stated in United States v. Salerno (481 U.S. 739 (1987)), "there is nothing inherently unattainable about a prediction of future criminal conduct" – but empirically based risk assessments are now routinely used in making bail decisions in many jurisdictions. Likewise, in the context of parole decision making, the tools developed by social scientists to assess the risk of recidivism are now being used in many states.

The use of social science research to identify people presently in the process of violating the law is exemplified by the approval of the social science-based 'skyjacker profile' to identify people in the process of commandeering an aircraft. Not surprisingly, such uses of social science in the national security context have been greatly expanded in light of the events of 11 September 2001.

The uses of social science research to identify people who have violated the law in the past – including 'cultural defense' cases; cases involving defendants who argue that they are battered women or battered children, or are suffering from combat-induced posttraumatic stress disorder; and cases in which the prosecution argues that the complainant exhibited symptoms of rape trauma – are now very commonplace.

Perhaps the most frequently litigated example of a social framework is when it is applied not to a criminal defendant but to an eyewitness to a crime. In State v. Chapple (660 P.2d 1208 (1983)), for example, the only evidence that the defendant had committed murder was the word of two eyewitnesses. At trial, the expert testimony of a research psychologist was offered by the defendant to counter the testimony of the eyewitnesses. In a proffer of the evidence, the psychologist described published studies on factors such as the speed with which memory decays over time, the effects of stress on eyewitness accuracy, and the relationship between the confidence of a witness and the accuracy of identification. The trial court held that the research on the accuracy of eyewitness identification was not a 'proper subject' for expert testimony and excluded the expert. However, the Arizona Supreme Court reversed and remanded the case for a new trial, stating that "there were a number of substantive issues of ultimate fact on which the expert's testimony would have been of significant assistance."

As an indication of how far some American courts have come in informing juries about social science research on the vagaries of eyewitness identification, consider the 2011 decision of the Supreme Court of New Jersey in the case of State v. Henderson (27 A.3d 872). Henderson argued that an eyewitness mistakenly identified him as an accomplice to a murder. The court stated:

> We appointed a Special Master to evaluate scientific and other evidence about eyewitness identifications. The Special Master presided over a hearing that probed testimony by seven experts and produced more than 2,000 pages of transcripts along with hundreds of scientific studies. Study after study revealed a troubling lack of reliability in eyewitness identifications. From social science research to the review of actual police lineups, from laboratory experiments to DNA exonerations, the record proves that the possibility of mistaken identification is real. Indeed, it is now widely known that eyewitness misidentification is the leading cause of wrongful convictions across the country.

The court concluded that an extensive array of instructions to the jury on the factors known to compromise the accuracy of eyewitness identifications should be given in appropriate cases, and in addition that 'there will be times when expert testimony will benefit the trier of fact,' and therefore expert testimony on eyewitness identification should be permitted as well.

In neither of these eyewitness cases was social science research being used to provide legislative facts. No creation or modification of a rule of law was sought. Rather, in both cases the parties offering the research accepted the applicable legal rules and sought to show that the research would help the jury to decide the specific factual issues being litigated. Yet in neither of these eyewitness cases was social science research being used to provide adjudicative facts either. The parties to the cases were not involved in the research at all: the experts relied on research studies published before the events that gave rise to the litigation took place.

The way that social science was used in Chapple and Henderson, however, reflects the defining characteristics of both legislative fact and adjudicative fact. In each case, the research demonstrated the critical component of legislative fact – generality. Just as the research used in Brown v. Board of Education (1954) focused on the benefits of racially integrating all public schools, the research used in Chapple and Henderson focused on 'general factors' affecting all eyewitnesses. In each case, the research used also possessed the critical component of adjudicative fact – specificity. Just as the research used in Pharmacia Corp. v. Alcon Laboratories (2002) spoke only to whether consumers were confused between two given products, the studies in Chapple and Henderson were used only to challenge the testimony of particular eyewitnesses to a particular crime.

The research used in these cases and many like them is thus neither wholly legislative nor wholly adjudicative fact but has the essential elements of both of the conventional categories. As mentioned in this article, Walker and Monahan (1987) have proposed social frameworks to denote the use of general conclusions from social science research to determine factual issues in a specific case.

Future Directions

At the beginning of the twenty-first century, social science in the legal process is being transformed by the rapid rise in the availability of material to train lawyers and judges in the uses of scientific evidence, including social science evidence (Simon, 2012). Shortly after Daubert, the Federal Judicial Center published a volume titled *Reference Manual on Scientific Evidence* that in 2011 went into its third edition. In addition, Faigman et al. (2011) published a comprehensive, five-volume, frequently updated work titled *Modern Scientific Evidence: The Law and Science of Expert Testimony*. A law school casebook titled *Social Science in Law: Cases and Materials* (Monahan and Walker, 2010) reviews the field and is now in its seventh edition. Works educating social scientists about the law also abound (Dvoskin et al., 2012; Skeem et al., 2009).

In the past decade, it has become difficult to find a Supreme Court decision implicating an empirical question in which the majority or the dissent did not cite social science research – a practice now as common among conservative as among liberal justices. Amicus briefs replete with references from the social sciences have become the rule rather than the exception in major litigation. Debates about relying on social science to create general contexts for resolving issues specific to a case have gone from whether to permit this procedure to how best to present empirical information to the fact finder.

Finally, a landmark report by the National Research Council, Strengthening Forensic Science in the United States: A Path Forward (2009), while focusing on biological science evidence such as DNA and fingerprints, may have significant implications for improving the quality of social science evidence admitted in court as well. In this regard, many see the future of social science in law as inextricably bound with recent and rapid developments in the biological sciences, particularly in the neurosciences. This may well be the case. But that future is not here yet (Morse, 2011), and may be quite some time in arriving.

Legal Realism

John Henry Schlegel, State University of New York, Buffalo, NY, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Legal realism was a movement in American legal thought between World War I and World War II. The American Legal Realists were legal academics who shared a politics that was liberal, though not socialist, and four overlapping interests. The first was in what Pound called 'the law in action,' where the Realists pursued studies of state and federal courts, banks, and parking and traffic enforcement. The second interest was in criticizing the doctrinal results of legal formalism (*see* Legal Formalism) where they worked in areas such as antitrust, commercial and corporate law, conflict of laws, evidence, and torts. The third interest was in judicial decision making, where the Realists argued that the inability of the doctrinal formulation of legal rules to yield determinate answers in concrete cases established the subjectivity of judicial decisions. The fourth was in legal education where they supported the reorganization of the course materials of legal study in terms of the functions performed by legal institutions and encouraged a shift from the justification of law in terms of derivation from supposedly logical principles to one based on assumed knowledge of social conditions to which law is applied in the pursuit of supposedly agreed-upon social policy.

'Legal Realism' is the name generally given to a movement in American legal thought between World War I and World War II. However, any attempt to identify precisely the intellectual content of the Realist movement is made difficult by the fact that its salient tenets, and thus its meaning, were widely contested during its heyday and are still widely contested.

Difficulties in Defining 'Legal Realism'

The Realist movement has been seen as an outgrowth of the Sociological Jurisprudence of Rudolf von Jhering as expounded by Roscoe Pound (1911–1912), as well as a reaction to Pound's work. In addition, many have understood Realism to be an outgrowth of the thought of Oliver Wendell Holmes, Jr. (1897), although it is not clear that such an identification is warranted, given Holmes' relentless pessimism and lack of faith in democracy. Also, while all agree that Realism was a reaction to legal formalism, sometimes referred to as 'conceptualism' – the notion that legal rules can be correctly deduced from a proper understanding of the nature of a limited set of important, narrowly legal premises – there nevertheless is disagreement as to whether any significant American legal thinker held such a position and thus what an opposition to formalism might signify (*see* Legal Formalism). The most that can be said is that all scholars agree that some portion of the activities of individuals commonly called Realists was directed at critique of the doctrinal results of what these scholars pejoratively labeled legal formalism, at understanding judicial decision-making, at empirical research in law, at reform of legal education, and at participation in the activities of the New Deal administration of Franklin D. Roosevelt.

There is, however, nothing close to agreement among scholars about the relative importance of these various activities for understanding Realism; moreover, the weighing of relative importance in part determines who is included in a list of the Realists. Thus, while it is likely that most scholars would agree that Thurman Arnold, Charles E. Clark, Walter Wheeler Cook, William O. Douglas, Jerome N. Frank, Walton H. Hamilton, Karl N. Llewellyn, Underhill Moore, Herman Oliphant, and Hessel Yntema belong on the list, the inclusion or exclusion of men such as Adolph A. Berle, Walter Bingham, Felix Cohen, Morris R. Cohen, Arthur L. Corbin, John Dewey, Leon Green, Robert L. Hale, Robert M. Hutchins, Edwin Patterson, Thomas Reed Powell, Edward S. Robinson, Max Radin, Fred Rodell, Wesley Sturges, and Leon Tulin, all plausible figures, will change one's understanding of Realism, as well as be dictated by that understanding. What follows, therefore, is only one of several possible expositions of American Legal Realism. Other expositions can be found in the works of Duxbury (1995), Horwitz (1992), Hull (1997), Kalman (1986), Purcell (1973), Rumble (1968), Schlegel (1995), Stevens (1983), Twining (1973), and Verdun-Jones (1979).

A Contestable Definition

'Legal Realism' is best understood as the reaction of a group of individuals within the American legal academy to (1) the collapse of the Progressive movement after World War I, (2) the decisions of the U.S. Supreme Court invalidating economic regulation on grounds either of substantive due process or of interference with vested contractual rights, and (3) the general shift of the United States to the political right in the Harding, Coolidge, and Hoover administrations. The important words in this definition are 'within the American legal academy,' for the movement largely took place at three schools – Columbia, Johns Hopkins, and Yale. Obviously, this definition does not succinctly describe the political orientation of the Realist movement. On this topic, the best that can be said is that, taken as a whole, the Realists were hardly radicals. It would be astonishing to learn belatedly that any of these men were members of the Communist Party, and it is doubtful whether any even voted Socialist. Many served in the Roosevelt Administration, but doing so was an indication of socialist leanings only to the most reactionary members of the business elite and their Republican Party allies. Thus, Realists are better seen as mainstream liberals caught in a very conservative time.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.86076-6

The relationship of the Realist movement to the Progressive movement can be seen both positively and negatively. Positively, there was the similarity in the political causes supported (organized labor), and opposed (big business). Also, the empirical research engaged in by many of the Realist scholars was similar to research undertaken by Progressive reformers (although not progressive law professors) before World War I. Indeed, both groups shared an 'all men of good will' ethics, as is evident from the notion underlying their empirical research that once the facts about a social problem are known, then reform will follow. In this sense, neither group was committed to what we would now see as an ideological view of law that would suggest that exposure of the 'facts' about a social practice might bring embarrassment (and thus denial and resistance to change). For both the Progressives and the Realists, evil existed in the world, but it existed in individuals, not in classes or other affinity groups.

The Realists' relationship to the Progressive movement can be seen negatively in the reaction of the members of the movement to Pound as dean of the Harvard Law School. Pound was a mainstay of the legal wing of Progressive reform movements before World War I. His condemnation of 'Mechanical Jurisprudence' (Pound, 1908) was a rallying cry for Progressives, as was his exposition of 'Sociological Jurisprudence' (Pound, 1911–1912). Pound's jurisprudence was designed to be a response to the first wave of antiprogressive constitutional decision-making by the Supreme Court. It seemingly encouraged empirical research by emphasizing the difference between "the law on the books and the law in action" (Pound, 1910), in order to urge courts to avoid a formal, mechanical application of law and instead to recognize, balance, and thus adjust the interests of the parties in the light of contemporary social and economic conditions.

Yet, for the Realists, Pound was also part of the problem that their activities were designed to address. For them, all of Pound's talk about the gap between the law on the books and the law in action and about the need for balancing of interests had never translated into the activity of exploring these gaps or identifying the interests in question through empirical research, or into actually suggesting how particular interests might be balanced. Moreover, Pound's law school was little changed from the school of Langdell and Ames, seen by Realist scholars to be among the arch formalists. It reflected none of what they saw as the implications of Progressivism and Sociological Jurisprudence for legal education – a revision of category systems, an emphasis on factual investigation, and explicit work on social policy.

What Realists Did

What the above definition pointedly lacks is some explicit statement of what the Realists believed, and therefore what Realism is. This omission is intentional. Realism is what Realists did, and it is only with that aphorism in mind that one can make sense of the disparate materials that were published by what must be seen as a network of friends, not a coherent intellectual position. Start, then, at the beginning.

Although some pre–World War I work by Bingham (1912) has a particularly Realist cast, Realism largely started at Columbia with pieces by Cook and Moore, who respectively argued for a more empirically based understanding of the real, as opposed to verbal, activities of appellate courts in the field of conflict of laws and of the real, as opposed to verbal, activities that made up the institutional practices that the law defined, such as property and contract. From their work, one can see that Legal Realism is not even a distant relative of philosophical realism, the doctrine that the concepts of daily life are ontologically real, but, as Leiter (1997) has suggested, is much closer to naturalism, a commitment to see and describe the realities of daily life scientifically, that is, without idealization or the avoidance of the ugly. However, in Legal Realism's concern with democracy and the activities of the middle class, there is some affinity with literary and artistic realism as well.

Curiously, the group of Realists who taught at Columbia, including Oliphant, Llewellyn, and Douglas, was not particularly interested in constitutional law, as might have been expected given the group's affinities to Progressivism. Instead they were interested in corporate and commercial laws. These men argued that, because of antiquated ideas about judicial decision making, in areas of law related to business, just as in constitutional law, the law was lagging behind changes in economic life, particularly the growth of the large corporation employing thousands of workers and the change in methods of production and distribution of goods that had broken older patterns of finance and trade. This focus had much in common with the Institutional Economics of John Commons, Richard T. Ely, and Thorstein Veblen that emphasized the way that the institutional (by which they meant regular) patterns of economic behavior determined the growth or decline of industries, attitudes toward labor, and practices in the pricing of goods. Thus, Moore worked on the law of banking, Oliphant on labor and antitrust, Llewellyn on the sale of goods, and Douglas on corporations and commercial bankruptcy.

Even more curiously, the empirical research that was implied by the work at Columbia was not undertaken there, but rather at Yale and Johns Hopkins, mostly in the years after the Columbia law faculty blew up over the results of a dean search. At Yale, pioneering empirical work, superintended by Clark, Douglas, and Moore, focused on the activities of the federal courts in civil, criminal, and bankruptcy cases; on the activities of bankers in handling negotiable instruments; on the operation of the tort system in auto accidents; on the effect of parking regulations in altering the behavior of drivers; and on the legal needs of citizens of modest means. At Johns Hopkins, equally pioneering work, superintended by Oliphant, Yntema, and their colleague at Columbia, Leon C. Marshall, was done on the operation of state courts in civil, criminal, divorce, and justice of the peace cases.

Much of the rest of the scholarship of the Realists, though not empirical in the narrowest sense, was still within artistic and literary naturalism's desire to describe the realities of daily activities. Cook's (1942) continuing work on what courts were really doing in conflict of laws doctrine and Green's (1927, 1930) parallel work on torts doctrine fit this mold, as does the works of Arnold (1935) and Robinson (1935) on the symbolic uses of law, Llewellyn's work on commercial practice (1936, 1937, 1939a, 1939b), Hutchins and Slesinger's (1928, 1929) work on the psychological underpinnings of evidence law, and Berle and Means' (1932) work on corporate governance. All of

this work, and most of the more narrowly empirical work as well, was directed at critiquing legal, particularly judge-made rules, but Realism is more famous for its related, but more frontal assault on contemporary understandings of judicial decision-making.

Realists attacked formalist understandings of judicial decision-making in three ways: logically, psychologically, and sociologically. The logical attack argued that legal concepts that the formalists, especially the formalists on the Supreme Court, saw as necessarily determining decisions were not in fact determinative. Here, Realists relied on Wesley N. Hohfeld, who argued that legal concepts inappropriately treated as unitary various discrete legal relationships, any one of which could not be implied from the existence of another; on Judge Benjamin N. Cardozo, who asserted that there were four different methods for deciding a case and so allowed the judge the 'sovereign prerogative of choice'; on Cook, who claimed that legal rules 'hunt in pairs,' so that for every rule there is an exception or counterrule whose application would lead to a different result; and on Llewellyn, who eventually demonstrated that there is a great range of acceptable techniques for dealing with a legal precedent. Together, these observations suggested that legal concepts did not produce necessary results by the use of logic alone, but rather permitted judges a choice of results, a choice that was made surreptitiously, as it were, without explicitly considering the function that the rules played in society or the policy behind those rules.

The psychological attack argued that judicial opinions, traditionally presented in a seemingly syllogistic form, hid a decision that was reached in very different ways. Here, Realists relied on the work of another judge, Joseph Hutchinson, who argued that most decisions were decided on the basis of a 'hunch' about the appropriate result, and of Frank, who argued strenuously that a judicial opinion was but a rationalization of a decision reached in another way, that formalism was motivated by an infantile search for paternal authority, and that a truly adult judge would recognize and expose the many factors, particularly the idiosyncrasies of his response to the facts proven at trial, that led to the choice that was made in an individual case. Together these observations suggested that judicial decisions obscured the real factors that operated to generate results in particular cases behind a web of false necessity.

The sociological attack, which was more muted than either of the other two, attempted to identify the factors at work behind the facade of the judicial opinion. Here, the most common argument implicitly drew on the work of William J. Ogburn, who argued that the structure of social understandings of the world commonly lagged behind the practices that these understandings purported to describe. Versions of this concept of 'cultural lag' were offered by the Realists to explain how it was that judges used an 'outdated' economic theory to understand labor conditions or commercial transactions, an 'outdated' psychological theory to understand witness testimony, or an 'outdated' political theory to limit governmental action to address the conditions of modern life. It was here that the Realists' jurisprudence, as that word is traditionally used, met up with their interest in empirical research. Faced with the facts gathered from empirical research, it was assumed that judges and other legal actors would come to abandon their outdated theories.

The Realists' remedy for the inadequacies of formalism was functionalism. The problems with formalism were seen to be the lack of relationship between the concepts and categories of the law and the 'realities' of modern life. Closer attention to these realities would allow one to focus the law's attention on institutions such as the organized activities of businessmen in a trade association, and on the functions that these activities represented, and so see to it that the law addressed directly the problems in that trade as a matter of effective and appropriate social policy. Such an analysis would disclose just when the law needed to be updated because of its lag behind social practice and also would expose circumstances where law was dysfunctional, or where a body of doctrine was ineffective, as, for example, when Arnold argued that the antitrust laws provided the comfort of a myth that law was doing something to address public fears about big business, while ignoring the anticompetitive practices that made for monopoly.

For all the talk about functionalism as an antidote to formalism as a jurisprudence, indeed for all that Realism is taken to be a jurisprudence, it is important to understand that much of the impetus behind realism was educational. The Realists were mostly law professors for whom the question of how to present the materials of law study was a daily concern. It is with respect to legal education that functionalism and empirical research might have been expected to have some real bite. Functionalism raised questions about what were the appropriate categories under which to group the legal materials, and a study of the entire curriculum at Columbia was undertaken to examine how the curriculum could be organized more functionally. Similarly, empirical research was designed to answer the questions about the efficacy of the institutions and rules of law in the aid of understanding what social policy was appropriate in each functionally defined area.

Although almost no part of the curriculum was rearranged functionally (e.g., the course in trusts is still taught despite the absolutely withering critique that Arnold leveled against it), and though law professors do little more empirical research today than was the case before World War I, it is in the area of education that Legal Realism had its greatest impact. The critique of formalism utterly changed the way that law was justified in the law school classroom. From a formalism based on assertedly logical derivation from the nature of a given legal category, the justification of legal rules has shifted to a realism based on assumed knowledge of social conditions to which law is applied in the pursuit of supposedly agreed upon social policy. The law professors now talk the language of the early twentieth century political science professors, as well as of the bureaucrats in Washington and in scattered state capitals. Whether this is an advance is for others to say (*see* Legal Education).

Realism Today

The continuing interest of scholars in Realism, a movement that had lost its energy by the time of the entry of the United States into World War II, is one of its most interesting aspects. Recently Barzun revisited Frank's *Law and The Modern Mind* and Fenster examined Arnold's understanding of the administrative state. The Law and Economics movement and Critical Legal Studies

movement both have claimed to be the legitimate descendants of Realism, despite these movements' different political orientations and their different understandings of what Realism was about. The Law and Society movement has done so as well, again with own understanding of what Realism was about, though arguably with a quite similar political orientation. The effort to protect the law from Legal Realism is of long standing (see Purcell, 1973; Duxbury, 1995); recently Tamanaha (2010) has added to that effort. From different perspectives, de Been (2008) has endeavored to protect Realism from Critical Legal Studies and Leiter (2007), from both Critical Legal Studies and Law and Society. Exactly why American Legal Realism is such a prized ancestor, as well as such a threat to law, is a matter that needs to be addressed in the literature.

Legal Reasoning and Argumentation

Geoffrey Samuel, Kent Law School, UK; Law School, Sciences-Po, Paris

Abstract

What is legal reasoning and argumentation? This article sets out to investigate this question both from a diachronic and a synchronic perspective. However one difficulty to be faced is the formulation of an appropriate epistemological framework. If one adopts a diachronic approach one can certainly appreciate what legal reasoning has been but it proves difficult to predict where it is going. Having started out as a descriptive-inductive technique, reasoning arrived in the nineteenth century as a formal deductive-axiomatic process. But, following the abandonment of such formalism in the twentieth century, what stage now follows the axiomatic? If one takes a synchronic approach various different models emerge in turn provoking conflict and debate about the nature and acceptability of these different models of reasoning.

Introductory Remarks

Legal reasoning and legal argumentation, from a practitioner's point of view, is at one level relatively easy to describe and to define: it is the reasoning used by lawyers to solve a legal problem, to advise a client or to justify a legal decision. Some would say that it is just ordinary reasoning used in a legal context (see e.g., Alexander and Sherwin, 2008). If one sees legal knowledge – as most lawyers seemingly do – as consisting of rules and principles (Susskind, 1987: 78–79), then legal reasoning is the reasoning attached to the application of these norms to specific problems. At another level, however, legal reasoning and argumentation can be seen to be extremely complex. One reason for this is that *all* method and reasoning in the sciences and social sciences is complex (see Law: History of Its Relation to the Social Sciences); the knowledge that emerges from the social science reasoning processes depends upon the schemes of intelligibility employed, the inferential reasoning techniques applied, the level of observation adopted, the theory brought into play and the paradigm orientations that inform these schemes and reasoning techniques (Desjeux, 2004; Berthelot, 2001). Legal reasoning might seem more straightforward than reasoning in, say, sociology, given that it would appear to be just a matter of applying rules to facts, but such a view is simplistic. Moreover, legal reasoning, strictly speaking, needs to be distinguished from legal argumentation: broadly speaking, one has the aim of both arriving at and justifying a decision while the other aims to convince.

Methodological and Theoretical Approaches

In fact one of the problems with legal reasoning is that it is capable of being approached from a variety of disciplinary and theoretical perspectives, each of which gives a rather different account. This may, of course, be true of reasoning in other areas as well; yet with respect to law it is more acute for what might be called a paradigm reason. Law, like theology, is subject to a particular paradigm orientation which might be labeled the authority paradigm (Samuel, 2008, 2009). Lawyers work with texts that can be criticized but never questioned in terms of their authority. A law is a law, and so the scope of reasoning about laws is always going to be limited in comparison to work in other, what might be called enquiry paradigm, disciplines. Consequently legal reasoning viewed from inside the authority paradigm – what might be called the internal view – could well be different from such reasoning viewed from outside the paradigm, that is to say, an external view, in that the epistemological models might well be different.

One of the challenges therefore is to determine the approach to be adopted. Does one look at what legal reasoning has been (diachronic) or does one look at what it is now, that is to say legal reasoning as a timeless set of techniques situated in the here and now (synchronic)? Does one adopt an approach internal to the law – that is, from the viewpoint of a lawyer and (or) judge – or does one adopt an approach external to the law, for example, as a social scientist or a philosopher? If one adopts an internal view, does one envisage legal reasoning to be based on a model of rules, of rights, of policy considerations, of remedies, of causes of action? If one adopts an external view, does one employ a causal, structural, functional, hermeneutical, individualist actional, or a dialectical scheme of intelligibility (see Berthelot, 1990: 62–83)? Moreover how are the standard techniques of inferential reasoning – induction, deduction, abduction, analogy, and metaphor – to be accommodated within these various approaches?

In addition underpinning these models and techniques are questions of theoretical approaches to law. Broadly speaking one can, traditionally, talk of three different schools of legal theory, namely natural law, positivism, and realism (see Legal Positivism; Legal Realism; and Natural Law). How might these theory positions affect reasoning and argumentation? Another distinction is between realism and formalism (Twining and Miers, 2010: 114–116; and see articles Legal Realism and Legal Formalism). How might this dichotomy impact upon reasoning? Epistemological issues bring their own distinctions and dichotomies (see Atias, 1985, 1994, 2002). Is law, and its reasoning, any different in essence from scientific reasoning? For example, is there a fundamental distinction to be made between explanation (scientific reasoning) and understanding (social science reasoning) (see Makkreel, 2006)? Might one wish to distinguish between axiomatic and casuistic reasoning (see Jonsen and Toulmin, 1988)? Has legal reasoning passed through distinct stages? Thinking about legal reasoning and argumentation will necessarily require an examination of, and reflection upon, all of these different models, techniques, schemes, and paradigm orientations.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.86159-0

The epistemological issues remain acute even when one examines legal reasoning and argumentation from a diachronic viewpoint. Now it might be tempting to think that the 'what legal reasoning has been' question has formed the object of considerable research. Yet this is not really the case, although the situation is changing (see e.g., Gordley, 2013). There is certainly much literature examining the different schools of civilian jurists and their methods, and this literature is of importance (see recently Champeil-Desplats, 2014). But the problem is that legal reasoning as the subject of research and analysis requires an epistemological framework through which the old jurists can be understood. As has been suggested, several different frameworks can be adopted. One could adopt, for example, a dichotomy that goes back to Aristotle, namely the one between axiomatic (formal) and casuistic (practical) reasoning. "In formal arguments," write Jonsen and Toulmin, "particular conclusions are deduced from ('entailed by') the initial axioms or universal principles that are the apex of the argument" (1988: 34), whereas practical arguments "draw on the outcomes of previous experience, carrying over the procedures used to resolve earlier problems and reapplying them in new problematic situations" (1988: 35). This model might be further developed by applying Robert Blanché's diachronic model to explain the stages through which scientific reasoning typically passes: it starts out from a descriptive stage passing through an inductive and then deductive stage before arriving at an axiomatic stage (Blanché, 1983: 65).

This Blanché model might work well enough for scientific reasoning, but with respect to the social sciences it could well break down (although it does work in part for law). And so another possibility is to analyze reasoning through the six schemes of intelligibility proposed by Jean-Michel Berthelot. These are the causal, structural, functional, hermeneutic, actional, and dialectical schemes, each of which is capable of combining with one or more of the other schemes depending upon the program or paradigm of the researcher (Berthelot, 1990: 62–83). Berthelot himself summarized the schemes as follows; there is:

> the *causal* scheme (if x, then y or $y = f(x)$); the *functional* scheme (S→X→S, where one phenomenon X is analyzed from the position of its function – X→S – in a given system); the *structural* scheme (where X results from a system founded, like language, on disjunctive rules, A or not A); the *hermeneutical* scheme (where X is the symptom, the expression of an underlying signification to be discovered through interpretation); the *actional* scheme (where X is the outcome, within a given space, of intentional actions); finally, the *dialectical* scheme (where X is the necessary outcome of the development of internal contradictions within a system).
>
> Berthelot, 2001a: 484

The importance of these schemes is that they provide the basic forms of epistemological engagement with social reality; they are the means by which this reality can be 'read.' They can – or some of them can – also be used in the engagement with a text. A structural reading can, for example, be contrasted with a functional interpretation.

There are other epistemological possibilities of course – one might focus for example on the concepts developed by the Romans and their subsequent history – but often the reasoning attached to the development and application of these concepts takes one back to schemes of intelligibility. History also reveals the importance of interpretation given the central role of texts in law (see e.g., Maclean, 1992). Again, as we have suggested, interpretative methods lead one back to schemes of intelligibility; structuralism, functionalism, dialectical techniques, and so on, when applied to the understanding of a text, can be behind differing interpretations (see further Samuel, 2009a).

Above and below schemes of intelligibility are other important epistemological considerations. Above the various schemes there are paradigm orientations within which the activity of reasoning takes place. When one examines the various historical schools of jurists these orientations are not always the same, although, as we have suggested the authority paradigm is largely dominant. Below the schemes are the modes of reasoning themselves. These modes or techniques of reasoning are associated with the idea of inference (Masquelet, 2006: 76); that is the operation by which one moves from one descriptive situation, proposition, or other given to another descriptive situation, proposition, or other given by means of an intellectual process. The four traditional modes of inferential reasoning are induction, deduction, abduction, and analogy (Masquelet, 2006: 75–93).

Early Civilians

All of this 'theorizing' will explain why the starting point for a historical examination of legal reasoning in Europe is not to be determined by time but by paradigm. If one was to look at legal reasoning in terms of time, the starting point would obviously be Roman law in Ancient Rome (see Stein, 1999). Yet such an approach is possibly not that helpful if one wishes to understand contemporary reasoning methods. Arguably the starting point should be the medieval jurists who worked, from the eleventh to the fifteenth century in Italy and elsewhere, on the rediscovered Roman texts that had been compiled and preserved by the Emperor Justinian in the sixth century AD. One starts, then, not at the beginning so to speak, but at a half-way point from where one can look both backward to the Roman jurists and forward to the subsequent civilians and common lawyers.

As James Gordley observes, the medieval jurist "was one who, by virtue of his specialized training, knew the Roman texts and could cite them to support his opinions" for law "was based, as much of it still is, on the exposition of authoritative texts" (Gordley, 2013: 32). A number of points need to be stressed about the medieval jurists who developed what became known in Europe as the *ius commune*. First, these jurists regarded the rediscovered Roman texts as completely authoritative statements not of 'Roman law' but of 'the law' (Stein, 1999: 46). They were not historians (thus they regarded every text as having equal authority), but lawyers whose job was both to explain the law to students in the newly established law faculties and to apply the texts to the practical problems of their time (Stein, 1999: 47). The method of explanation was exegetic; they explained the texts through margin notes (glosses) and, later, commentaries on the different parts of the Roman materials (*Corpus Iuris Civilis*) (Gordley, 2013: 28–51).

These glosses and commentaries themselves subsequently became authoritative (Jones, 1940: 15–21).

Second, although the Roman texts, and the practical problems discussed by the Roman jurists, were large and extensive, they did not cover everything and so the medieval jurists were faced with the problem of applying these texts to new situations. They did this in a largely casuistic way; they started out at the level of fact – persons and things – and developed Roman law notions using induction and analogy. Thus they might generalize a text by way of induction so that the rule (*regula*) could be applied to the new situation or they might take a particular factual problem discussed in the Roman texts and apply it by way of analogy (Gordley, 2013: 33–45). Equally they limited the application of a text or a rule by the use of distinctions and dialectical oppositions (Ullmann, 1975: 87). In doing this the later medieval jurists – the Commentators – fashioned what might be termed an algorithmic approach to legal reasoning and problem-solving (*aut* ... *aut*: either … or).

Third, the medieval jurists approached law and problem-solving in a way that today would be described as a highly 'positivistic.' The *modus arguendi* in law was limited entirely to the texts of the *ius commune* (Roman law). All arguments and reasons had to be based on a text from, and only from, the *Corpus Iuris Civilis*. In turn what the *Corpus* offered the jurist was a complete body of interrelating concepts, institutions, and technical language which had been sufficiently developed by the Roman jurists to serve the needs of the sophisticated commercial society that was Rome in the beginning centuries AD (Stein, 1999: 16–20).

Looking back from the medieval jurists to Roman law itself what the Roman jurists offered the European renaissance, through the preserved texts, was a firm foundation upon which a particularized legal reasoning could be developed. The system of concepts framed – in the *Institutes of Justinian* – around the three institutions of persons (*personae*), things (*res*), and actions (*actiones*) was the basic framework (Stein, 1999: 18–20). Between these institutions the jurists fashioned a series of relations between person and thing and person and person. The key relations between person and thing were ownership (*dominium*, *proprietas*), possession (*possessio*), and rights (*iura*) in another's property; and between person and person there was the obligation subsequently defined as a 'legal chain' (*vinculum iuris*). Attaching to these relations were other descriptive – or at least quasidescriptive – notions such as 'damage,' 'fault,' (*dolus*, *culpa*) and 'interest' (see generally Pichonnaz, 2008). Here, then, was a series of legal concepts and categories for a model of 'social reality' that could be manipulated to produce its own 'legal reality.'

Accordingly, and following on from this institutional model, the Roman jurists offered a sophisticated vocabulary and taxonomy that enabled the later jurists not only to reason in a 'positivistic' way but to develop this vocabulary and taxonomy to a more sophisticated level. And so, for instance, while there is a range of contemporary areas of legal studies such as constitutional, administrative, corporate, and human rights law that were completely unknown to the Romans, the foundations of these legal subjects can nevertheless be traced back – often via the medieval jurists – to the *Corpus Iuris Civilis* (see Mestre, 1985; Tierney, 1982; Canning, 1987).

In addition the texts reveal a series of reasoning techniques that became standard methods in the Western legal tradition. The jurists not just describe the various legal actions, legal texts, and legal rules (*regulae*) but interpret, illustrate, and test them through the posing of factual problems. In fact the jurists did more than this. They used these factual situations to develop the law itself by moving outward from one factual situation to another often via the question 'what if' (*quid enim si* …?) or some similar opening expression. In other words their casuistic techniques – which also included induction, distinction, and division – provided a means in themselves by which Roman legal reasoning could be employed by jurists in medieval and modern Europe (Kelley, 1990: 64–66). James Gordley compares this technique against the methods used by a philosopher, scientist, or social scientist all of whom define concepts abstractly and then work out their implications (Gordley, 2013: 8).

Later Civilians

When one looks forward from the medieval jurists a very different reasoning model gradually emerges. The change came in the sixteenth century with a school of French jurists known as the Humanists who developed a new approach toward the Roman texts (see generally Kelley, 1970). The humanists sought, on the basis of Roman classical law, to establish law as a science through which it could be explained clearly and systematically (Stein, 1999: 79–82). They wanted to cut through all the old 'pedantic' glosses and casuistic reasoning of the past – to get back to the original Roman texts and intentions of the authors who wrote them – so that the law could be perceived as a coherent whole. The emphasis henceforth was no longer to be on the particularities of the case and its analysis through dialectical distinctions and analogies but on what might be called the 'architecture' of the legal system – on how it fitted together as an interrelating systematic whole (Thireau, 2001: 232–238; Villey, 2006: 454–487).

Despite the fact that the humanist project had, at the time, little influence on legal practice or the methods employed by practitioners – the *Mos Italicus* (late medieval Italian methods) continued to dominate practice right into the seventeenth century (Jones, 1940: 34–35) – the longer term effect of this humanist revolution on legal reasoning proved immense. During the seventeenth and eighteenth centuries attention turned away from the kind of casuistic methods that characterized the Roman and medieval jurists toward a deductive and then axiomatic approach to reasoning. The authority of texts, which was the basic epistemological paradigm of the medieval age, gave way to a new paradigm, namely the authority of coherence. Thanks to jurists who were also mathematicians, such as Wilhelm Leibniz (1646–1716) and Christian Wolff (1679–1754), legal reasoning became associated with geometry (*mos geometricus*); solutions to legal cases were, accordingly, to be solved uniquely by the use of deductive logic (Gordley, 2013: 165–194; Champeil-Desplats, 2014: 60–63). The result was a complete change in the nature and style of law books. The dialectical method of

division, distinction, induction, and analogy, rooted in practical case examples, was replaced by a highly systematized set of ever more abstract legal propositions that no longer followed the order set out in the main source of Roman law itself, namely the *Digest*. They adopted the style and structure which characterized the *Institutes*. Thus, in France, the jurist Jean Domat (1625–96) rearranged Roman law in its 'natural order' so that the Roman law was to be learned and applied, not through the reading and application of the original texts, but through a set of principles. The great advantage that this textbook reform brought to law – an advantage for practitioners as well as students – was that the law (in effect Roman law) became very much easier to read and absorb (Gordley, 2013: 145).

Moreover, before the nineteenth century, these principles or 'axioms' (*primae notiones*) were seen as part of a system of transnational natural law (*ius naturale*) and this resulted in a reasoning process founded on the premise that there are no gaps in the law. Even if the domestic law (*ius proprium*) proved wanting, there would always be the higher principles (*ius naturale*), discoverable and applicable through 'right reasoning' (*recta ratio*), which would provide a solution. The idea that there is a 'right answer' – associated with the twentieth century jurist Ronald Dworkin – to every hard case is, therefore, no new idea. Even with the coming of positivism and monism in the nineteenth century this axiomatic conceptualism was by no means abandoned. Indeed it was consolidated (Gordley, 2013: 195–204, 212–215). The *ius naturale* was replaced by the idea of *scientia iuris*, the thesis that the authoritative legal texts themselves – now the only valid source of law – were underpinned by a set of concepts from which legal solutions would be logically deduced by legal scientists (Champeil-Desplats, 2014: 71–93).

The humanist jurists changed legal perception in another way as well. In addition to emphasizing the importance of system they reflected the effect of the nominalist revolution that had been provoked by the medieval philosophers. These thinkers held the view that abstractions had no existence in the world of reality and were thus only names (*nomina*); there were, for example, no such things as 'forests' only trees (Jones, 1940: 169–170; and see generally Villey, 2006). The result was that the Roman expression *ius* took on a new, more individualistic meaning. Now, in classical Roman law, the term *ius* probably gave expression to the idea of a legal relation rather than some kind of individual 'right' and certainly when it came to problem solving the key institution was the *actio* (Jolowicz, 1957: 77). This notion of a right was subsequently to become a fundamental legal reasoning concept because it could act both as a focal point for legal thinking – legal disputes are about determining the 'rights' of the parties – and as a vehicle for importing philosophical, social, and (or) political ideas into law.

After the sixteenth century, therefore, legal reasoning could be framed not only around the interpretation and application of a rule (*regula*) but equally around the existence or nonexistence either of a remedy (*actio*) or of a right (*ius*). In other words several models of reasoning possibilities in law were now established. In particular one could view law objectively as a system of rules (*regulae*) or subjectively as a system of rights (*iura*).

Common Law Reaction

By the beginning of the twentieth century, then, the dominant form of legal reasoning in the civil law tradition was the axiomatic model, these 'axioms' finally being given expression in the great civil codes of France (1804) and Germany (1900). Legal solutions were determined through the use of deductive logic. However this formalism was to be challenged by the American common lawyers, who turned away from conceptual structuralism and hermeneutics to a different scheme of intelligibility, namely the functional approach (see e.g., Cohen, 1935). Yet to appreciate the impact of American Realism on common law thinking something obviously needs to be said about what legal reasoning has been in the common law tradition (see Common Law). And, as with the civilians, the most useful starting point is probably not a linear one determined by time; it is more useful to start midway and then to look both backward and forward.

According to Sir John Baker, the key period in the development of the English common law – at least in terms of legal thought and reasoning – was the sixteenth century (Baker, 2003). It was during this period that there began to develop a more sophisticated view of English legal history which, of course, involved a sense of it not being one involving Roman law or humanist learning. There was no blueprint like the *Corpus Iuris Civilis*; what had been built up over the previous centuries were, primarily, cases and these had been organized around a system of writs, or forms of action, that owed nothing to the Roman *actiones*. Looking backward from the sixteenth century there was not really a common law in the sense of a body of rules (*regulae*) or rights (*iura*) because the major decision-making institution was the jury, consisting of nonlawyers who did not give reasons for their decisions. As for judges, they were little more than umpires comparable to a sports referee (Baker, 2003: 43). Indeed even the Court of Chancery, whose procedure was so very different from the one that governed the three courts of common law, "behaved more like a jury than a court of law" (Baker, 2003: 42; and see article Equity in Law). There was no textbook law of personal property, contract, and delict (tort) because cases came to court through formal actions (or writs) such as debt or trespass and decisions were taken by juries largely on a mixture of fact and law. In the sixteenth century the position changed. Juries became less central and were gradually restricted to deciding questions of fact leaving judges to decide questions of law. The scene was set for the development of an English law – and of course an English form of legal reasoning and argumentation – founded on the decisions of the royal courts.

Looking forward from the sixteenth century, the position at "the beginning of the eighteenth century" was that "most common lawyers did not seek to put their law into rational form" because "they saw the law as a form of reasoning working within a set of remedies" (Lobban, 1991: 9). English lawyers may or may not have been interested in civilian learning, but there was certainly a suspicion of the deductive method. If there was a legal 'science,' it was a science of pleading. As Michael Lobban explains, this procedural attitude gave rise to a form of legal reasoning "which allowed lawyers to look outside the law for solutions to legal problems, once the

terms of the legal dispute had been set" (1991: 80). Thus, says the author, there were two types of reasoning; there was reasoning within the law (which was a matter of applying precedents by way of analogy) and reasoning outside the law (which "drew on a vast range of 'sources', invoking natural law, justice, political philosophy, political economy, and convenience"). If there was one driving force underpinning English legal reasoning at the end of the eighteenth century it was the desire "in judges' minds … to provide the legal answer which best served the needs of society, so that the common law was based less on concepts of 'justice' or 'natural law' and more on expedience and public policy" (1991: 90).

One might say, then, that the functional challenge – in the form of policy reasoning – is quite deeply embedded in the history of common law reasoning. Nevertheless the system of forms of action "was displaced in the nineteenth century when common lawyers became concerned not with the results that the courts were reaching … but with explaining these results" (Gordley, 2013: 27). Accordingly, with the abolition of the forms of action, effectively in 1852, the common lawyers turned to civil law for their categories and their theories (see Samuel, 2010: 8–9). A textbook tradition and the emergence of full time law faculties at universities that set out the law as a series of rules (*regulae*) arising either from precedent or from statute started to replace the old law of actions thinking; and once the idea of law as a set of coherent rules established itself English legal reasoning shifted toward a more syllogistic approach.

Realism was a reaction against this deductive approach but, as Gordley points out, it did not as such provide an alternative reasoning method (2013: 281). Nevertheless it did open up legal thinking to interdisciplinary alternatives that drew on ideas and concepts from the social sciences more generally (see Singer, 1988; Law: History of Its Relation to the Social Sciences). The results were that a range of approaches emerged, many of which either attached law to some other discipline or put the emphasis on concepts such as social interest and (or) policy (see Law and Economics: Empirical Dimensions). This move away from a strict structural conceptualism with its emphasis on logical deduction now characterizes much legal reasoning in the common law world (Lloyd and Freeman, 2008: 999). However it would be a mistake to think that this was a move away from 'scientific' method. What realist thinking permitted – or some kinds if realist thinking permitted – was the possibility of applying a causal scheme of intelligibility to legal argumentation and reasoning. A legal decision could be justified on the basis of, for example, promoting a particular social interest objective or some economic result (cause and effect). In turn a discipline like economics could 'explain' legal decisions both functionally and causally (Posner, 1983). At any rate, what realism has contributed to legal reasoning is a willingness on behalf of many common law judges to have recourse to policy as a form of argumentation and justification.

Legal Argumentation

This policy reasoning approach did not go unchallenged. Ronald Dworkin (1931–2013) forcefully asserted that cases should be decided on the basis not of policy but of rights (see Rights: Legal Aspects). He argued that the rights thesis gives a more satisfactory explanation than policy of how judges use precedent; rights can be justified within a theory of law whereas policy arguments cannot since the latter belong to the operation of the political process (Dworkin, 1977: 82–86). This thesis in turn is based upon a distinction between arguments of principle and arguments of policy.

This movement away from a functional scheme of intelligibility entailed a return to hermeneutics and to structuralism. Accordingly, to take the latter scheme first, what the ideal judge must do is to "construct a scheme of abstract and concrete principles that provides a coherent justification for all common law precedents and, so far as these are to be justified on principle, constitutional and statutory provisions as well" (Dworkin, 1977: 116–117). In addition, Dworkin insisted, legal reasoning and argument is about integrity; it is about "the best constructive interpretation of past legal decisions" (Dworkin, 1986: 262). Indeed law itself "is an interpretive concept"; and so judges "should decide what the law is by interpreting the practice of other judges deciding what law is" (1986: 410). Dworkin did not, however, see this constructionism as "an algorithm for the courtroom" (1986: 412). Rather it was a literary process. Thus the philosopher compared this hermeneutical process to the writing of a chain novel, that is to say "an enterprise [where] a group of novelists write a novel seriatim; each novelist in the chain interprets the chapters he has been given in order to write a new chapter, which is then added to what the next novelist receives, and so on." Each novelist is under an obligation, when writing his or her chapter, "to make the novel being constructed the best it can be, and the complexity of this task models the complexity of deciding a hard case under law as integrity" (1986: 229).

This is a very serious, and imaginative, attempt to give an account of legal reasoning, at least within the common law tradition. However it is not free from difficulty. The first and main problem is with the distinction between a proposition of principle and one of policy. Neil MacCormick observed that the word 'policy' is "a hideously inexact word in legal discourse" and, in fact, that when "we raise the question whether a given policy goal is desirable or not, we are raising a question of principle" (MacCormick, 1978: 263). Stephen Waddams has equally shown that from a historical point of view the distinction between principle and policy – at least in the area of the law of contract – is untenable (Waddams, 2011).

A second problem was perceived by Paul Ricœur. The application of a legal rule is a very complex operation where, said Ricœur, the interpretation of facts and that of the norm are mutually interrelated in a conditional way and that the facts are capable of being interpreted in different manners (1995: 180). Precedent is founded on the idea of similar cases, but when are cases similar? This is not just a question of textual interpretation; it is equally an issue of deciding when facts are similar and dissimilar. And, as Stephen Waddams noted, facts "may be stated at countless levels of particularity, and legal issues and legal rules may be formulated at countless levels of generality" (Waddams, 2003: 14). The importance of these remarks cannot be overstated. The idea that legal reasoning and argumentation is reasoning with respect to rules and texts is misleading. How a lawyer constructs the facts can be just as important in the argumentation, decision making, and justification processes

as the way she interprets a rule or a series of cases (Atias, 1985: 129; and see Samuel, 2003).

Models of Legal Reasoning

History, then, has bequeathed a number of different possible models which coexist, even if this coexistence is uneasy at times. Indeed the models often overlap and some are the result of a particular judicial culture. This history, as has been seen, is a long one characterized by different schools of jurists who, in the civil law tradition, brought to bear on the texts of Roman law different methods and techniques. Even within the common law tradition, so different in many ways from continental jurisprudence, the influence of Roman law has not been absent.

Rule Model

By far the most important model for legal reasoning is what might be called the rule model. The epistemological basis of this model is that knowledge of law is a matter of knowing rules (*regulae iuris*: D.50.17) – including principles (rules at higher levels of abstraction) – and thus applying the law is a matter of applying these statutory or precedent rules (and principles) to the factual litigation problems that present themselves. As the French Code of Procedure puts it, the "judge shall decide the litigation in accordance with the rules of law which are applicable to it" (article 12). The normal process by which this application takes place is through the syllogism (Perrot, 2010: 181–182; but cf Lasser, 2004). The rule is the major premise, the facts the minor premise and when the conditional elements of the rule are matched to the facts the solution logically follows (Champeil-Desplats, 2014: 80). This approach, as has been seen, is associated with the civilian rationalists whose writings began to dominate legal thinking in Europe from the sixteenth century onward; but it is also present in the common law (see *Lupton* v *FA & AB* [1972] AC 634, 658–659).

However an automatic inferential process is possible only when the conditions contained in the rule are unambiguous in the face of the facts; if there is ambiguity the syllogism is insufficient and what is required in addition is an interpretative process. A rule stating that vehicles are prohibited in the park can probably be syllogistically applied if a person enters on her motorbike, but the rule cannot be so easily applied to a child who enters on his small tricycle (see further Twining and Miers, 2010: 344–348).

Interpretation Model

This problem of uncertainty in language leads one toward another model of which (along with the rule model) is of primary importance given that most cases – even in the common law world – involve the application of a statutory text. It is unlikely that many disputes would reach litigation stage if there was not an interpretation problem. The kind of techniques brought to bear on the text depend upon the position of the observer; a lawyer taking a view from inside the discipline – and thus inside the authority paradigm – is likely to see the reasoning in terms of established legal rules of interpretation (see Twining and Miers, 2010: 230–267). A social scientist observing interpretation from outside the law discipline might well apply a rather different epistemological framework; how texts are interpreted often depends upon the scheme of intelligibility applied. A structural approach ('offer' has the same meaning throughout the law: see *Fisher* v *Bell* [1961] 1 QB 394) could well result in a different interpretation from a functional one (public interest or policy). A dialectical scheme founded on a *distinctio* (a 'lake' is defined in relation to it not being a 'pond') could give a different result from a hermeneutical one which seeks understanding of the legislator's intention (*mens legislatoris*).

Viewed from a historical perspective, the interpretation model has a long history, the starting point of which is the relevant material in the Roman sources (Jolowicz, 1957: 6–20). What emerges from the scholarship of the medieval and Enlightenment jurists is a series of dialectical oppositions between the words of a text (*verba*), the spirit of the law (*ratio iuris*), and the intention of the legislator (*mens legislatoris*) (Maclean, 1992). The interpretative model of law is, then, not just a sophisticated reworking of the rule model; it is a legal reasoning theory that injects into law a dynamic aspect. The judge, thought Dworkin, is an author in some huge project that is analogous to a never ending chain novel.

Rights Model

Dworkin equally emphasized that judges should concern themselves only with rights and not with policy arguments. This rights model has a tradition that, in terms of the word *ius*, goes back to Roman law. Yet "[t]he word 'right' is used in a variety of different senses, both popular and jurisprudential" and thus suffers from an inherent ambiguity (Lord Oliver in *In re KD* (*a minor*) [1988] 1 AC 806, 825). There have, of course, been attempts to provide clarity. For example while some have tried to create an abstract conceptual model from which rights could be inferred or deduced as a matter of logic, other writers have attempted to define rights, bottom up so to speak, in relation to empirical notions such as social interests. A right is a particular social interest that the law has endowed as such thus elevating it above other, conflicting, social interests that the law does not treat as rights. All of these definitions are not without their difficulties, but the rights model has been developed by a generation of younger jurists working in the area of private law (see e.g., Robertson and Wu, 2009). According to these jurists, reasoning in law is about determining and balancing rights that individuals have with respect to each other and involves distinguishing rights, for example, from interests, from liberties, and from privileges.

Policy Model

As has been mentioned, Dworkin developed his rights thesis in opposition to policy reasoning. This latter model is functional (or instrumental) in its orientation in that it looks to the social, economic, or (and) political purpose of a rule or concept in order to justify a particular interpretation and decision. In this model legal reasoning is about justifying decisions in terms not of logic or recourse to some abstract conceptual structure of

rights but of social or economic goals. According to one English appeal judge:

> In previous times, when faced with a new problem, the judges have not openly asked themselves the question: what is the best policy for the law to adopt? But the question has always been there in the background. It has been concealed behind such questions as: Was the defendant under a duty to the plaintiff? Was the relationship between them sufficiently proximate? Was the injury direct or indirect? Was it foreseeable, or not? Was it too remote? And so forth.
>
> Lord Denning MR in *Dutton* v *Bognor Regis UDC* [1972] 1 QB 373, 397

This approach has been taken to a more sophisticated level by the law and economics school which considers that legal reasoning should largely be founded on a mixture of the functional and causal schemes of intelligibility (see Law and Economics: Empirical Dimensions). Decisions are to be justified by reference to economic goals. Yet one problem with this functional model is that judges often do not support their policy arguments with any serious economic or social science research and this is what leaves them open to attack from jurists who are more formalist in their approaches.

Remedies Model

Another approach that stands in contrast to the rights model is one that sees legal reasoning as a matter of categorization of facts in relation to the availability of legal actions. It has been well expressed by Sir Nicolas Browne-Wilkinson who observed that in "the pragmatic way in which English law has developed, a man's legal rights are in fact those which are protected by a cause of action." He continued by saying that it "is not in accordance ... with the principles of English law to analyze rights as being something separate from the remedy given to the individual." Consequently, "in the ordinary case to establish a legal or equitable right you have to show that all the necessary elements of the cause of action are either present or threatened" (*Kingdom of Spain* v *Christie, Manson & Woods Ltd* [1986] 1 WLR 1120, 1129). As for a 'cause of action,' it is "simply a factual situation the existence of which entitles one person to obtain from the court a remedy against another person" (*Letang* v *Cooper* [1965] 1 QB 232, 242).

If the rights model is characterized by the expression *ubi ius ibi remedium* (where there is a right there is a remedy), the remedy model finds expression in a reversal of this maxim: *ubi remedium ibi ius*. It is a model that seems to apply both to early Roman law and to early English law and tends to generate a form of thinking where the emphasis is on the factual situation. One examines the facts to see if there is a 'cause' (see D.9.2.52.2). The method of reasoning associated with this model is one of analogy: do the facts of a potential litigation match the factual situation envisaged by the cause of action and remedy?

Concluding Remarks

These models are not exhaustive and, moreover, they largely represent a viewpoint from inside the authority paradigm. They are models that might well be discussed in an introductory work on legal reasoning aimed at law students and one imagines that the judiciary would find little of it threatening. One reason for this 'internalism' is that the foundations, and to some extent the limits, of the debate have been determined by the Roman jurists and the Latin concepts and categories that they employed. Expressions such as *ius*, *regulae iuris*, *actiones*, *verba*, *ratio iuris*, *scientia iuris*, *ius naturale*, *interesse*, *utilitas*, and so on have acted as focal points for schemes of reasoning and a good many modern theories can be traced back to these notions via the medieval jurists (Jones, 1940). As has been seen, the common lawyers were not immune to this continental theorizing. This is not to suggest, of course, that any Roman jurist, if miraculously transported into the future in a time machine, would have understood any of the post sixteenth century literature on Roman law. But these modern jurists, at least until recently, had a different epistemological outlook than either the Romans or the medieval thinkers; they were engaged in a search for intellectual coherence since this would help endow law with a scientific validity. Just as theologians once used systems thinking and its coherence to affirm the Christian message (Riaudel, 2007; see article Science and Religion), so jurists turned to the same methodological approach to affirm the (claimed) scientific message – the authority – inherent in the Roman texts. A systems approach also – and most importantly – merged the diachronic with the synchronic. It thus held (seemingly) enormous promise for rationalist jurists.

If one steps outside of the authority paradigm, then perhaps a different set of models would be more appropriate. A social science epistemologist would, perhaps, prefer to explain legal reasoning through the six schemes of intelligibility identified by Jean-Michel Berthelot. All the same, this theorist was himself rather dismissive about law's contribution to social science epistemology; what he called the 'science of texts' either defines itself by a specific object approached in interdisciplinary fashion or makes use of a hermeneutical program that is not its own (2001: 12). According to Berthelot, then, law has little as a discipline to contribute to epistemology. Perhaps this present survey will confirm this opinion or, in contrast, it could identify a particular body of reasoning techniques that creates its own institutional reality. This is a closed and formalized world of *personae*, *res*, *actiones*, *iura*, and *regulae* in which a range of schemes of intelligibility and inferential reasoning techniques – induction, deduction, and analogy – function just as in other areas of knowledge. Accordingly, analyzed into its constituent parts, there is, one might say, nothing special about legal reasoning. Taken as a formalized whole, however, there might be more than the sum of its parts. A client involved with a dispute will expect from the professional lawyer a prediction as to how a court might decide the case or, if not that, what are his or her 'rights.' For "[e]lementary justice or ... the need for legal certainty demands that the rules by which a citizen is to be bound should be ascertainable by him (or, more realistically, by a competent lawyer advising him)" (Lord Diplock in *Fothergill* v *Monarch Airlines* [1981] AC 251, 279).

In giving a reasoned response the 'competent lawyer' might not apply the interpretative integrity demanded by Dworkin or the deductive rigor desired by a nineteenth century German jurist. The lawyer might not even turn to economics or some other discipline to supply a fully functional response. But the lawyer will, probably, apply a mixture of hermeneutical,

structural, functional, and or dialectical techniques, together with the standard forms of inference (induction, deduction, and analogy, depending on the source of the laws applicable), to the facts as described by the client and reconstructed by the lawyer. And the lawyer will do this with reference to a formalized model of persons, things, and remedies between which flow a range of concepts and relations themselves organized by a taxonomy that has been determined as much by history – in particular the Romans – as by rationality.

While legal reasoning could be described as managing uncertainty, it ideologically cannot easily admit this. Justice demands certainty. Law sets its own limits within an authority paradigm that bolsters this authority through a belief in coherence and thus predictability (see e.g., Robertson, 2009). Legal reasoning is constantly under disciplinary pressure that only conceals its fragmented epistemological foundation. It functions 'as if' there is a coherent model of rules and concepts 'out there' so to speak; and it is this consensual model that acts as the framework for a set of reasoning techniques by a group of 'disciplined' professionals. There may be disagreement about the elements of the model (rules, rights, remedies, or whatever) but there is consent that there is a model 'out there' that governs. It is arguably all a fiction (Vaihinger, 1924, 2013), but that is another story.

Legal Reasoning: Computational Models

Henry Prakken, Utrecht University, Utrecht, The Netherlands; and University of Groningen, Groningen, The Netherlands

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article reviews computational models of legal reasoning as they are being developed in the field of artificial intelligence and law. A theoretical aim of these models is to understand legal reasoning by simulating it in a computer program, while a practical aim is to study how advanced information technology can aid legal practice. First logical deduction is discussed as a necessary but insufficient component of realistic models of legal reasoning. Then models of defeasible legal reasoning and legal argumentation are discussed, which focus on the generation and comparison of reasons or arguments for and against legal claims. Computational models of legal interpretation emphasize the interplay between rules and cases and the role of principles, purposes, and values. Computational models of legal proof account for the uncertainty in legal proof in three alternative ways: with Bayesian probability theory, argumentation, and narrative. Finally, procedural models of legal reasoning are based on the idea that the quality of a legal decision partly depends on how it was reached.

Introduction

This article reviews computational models of legal reasoning as they are being developed in the field of artificial intelligence (AI) and law. (Some parts of the text of this article are adapted from Prakken and Sartor (2002) or Prakken and Sartor (submitted).) Computational models of legal reasoning have been developed for two main purposes. A theoretical aim is to understand legal reasoning by simulating it in a computer program, while a practical aim is to study how advanced information technology can aid legal practice. Both types of research have had considerable success. Computational models of legal argument have advanced the understanding of legal reasoning, while legal knowledge-based systems are in routine use in areas of legal administrative decision making in several countries.

Some may fear that using computational methods in the law enforces mechanical law application, without regard for social consequences or for principles of fairness and justice. However, this is a misconception. Computational approaches require clarity of meaning and explicitness of structure, but this should not be confused with mechanical law application or with the view that the only valid source of the law is legal rules. Although some early systems were open to this criticism, there is nothing in a computational approach that requires judges to mechanically apply rules without looking at the consequences of applying the rule. On the contrary, computational models exist of arguing why an applicable rule should not be applied to a case or why a nonapplicable rule should be broadened to make it apply. Likewise, there is nothing in a computational approach that insists on the uniqueness or completeness of interpretations of the law. On the contrary, computational models exist of arguing for alternative interpretations and about their relative merits. Finally, computational models of legal reasoning exist that acknowledge cases, principles, or opinions in society about justice and fairness as valid sources of the law.

Models of legal reasoning must be diverse. A legal case has various aspects, each with its own modes of reasoning: determining the facts, classifying the facts under legal concepts or conditions, and deriving legal consequences from the thus classified facts. When determining the facts, the modes of reasoning are often probabilistic and may involve reasoning about causation and about mental attitudes such as intent. Classifying the facts under legal concepts involves interpretation. Here the prevailing modes of reasoning are analogy, appeals to precedent or policy, and the balancing of interests. Finally, when deriving legal consequences from the classified facts, the main modes of reasoning are deductive but leave room for exceptions to rules, either statutory or based on principle and purpose, and have room for conflict based on the general hierarchy of legal systems, where rules derive from different sources. Models of legal reasoning also depend on the task that is modeled, for example, advice, advocacy, or decision making. This article will primarily focus on the context of a court proceeding, where a judge has to adjudicate a conflict between two adversaries.

About any computational model of reasoning three questions can be asked:

1. What is the underlying theory of reasoning?
2. Can the knowledge required by the reasoning be represented in the computer?
3. Can the computer reason efficiently with this knowledge?

This article will primarily focus on the first question but the other two will not be totally ignored. The third question is addressed in other areas of AI, and the resulting techniques can be used in AI and law when available. The problem addressed by the second question has so far been the bottleneck, hindering scaling computational models of legal reasoning up to practical use. Where it has been solved (either by explicit representation or by automatically learning the knowledge from data), feasible and successful applications have resulted.

Legal Reasoning as Deduction

A simple but naive model of legal reasoning sees it as logically deducing legal consequences from a precisely stated body of

 http://dx.doi.org/10.1016/B978-0-08-097086-8.86161-9

facts and legal rules. On this account, once a legal text and a body of facts have been clearly represented in a logical language, the valid inferences are determined by the meaning of the representations and so techniques of automated deduction apply. However, this mechanical approach leaves out most of what is important in legal reasoning. To start with, the law is not just a conceptual or axiomatic system but has social objectives and social effects, which must be taken into account when applying the law. Moreover, legislators can never fully predict in which circumstances the law has to be applied, so legislation has to be formulated in general and abstract terms, such as 'duty of care,' 'misuse of trade secrets,' or 'intent,' and qualified with general exception categories, such as 'self-defense,' 'force majeure,' or 'unreasonable.' Such concepts and exceptions must be interpreted in concrete cases, a process which creates room for doubt and disagreement. This is reinforced by the fact that legal cases often involve conflicting interests of opposing parties. The prosecution in a criminal case wants the accused convicted while the accused wants to be acquitted. The plaintiff in a civil-law suit wants to be awarded compensation for damages, while the defendant wants to avoid having to pay. The tax authority in a tax case wants to receive as much tax as possible, while the taxpayer wants to pay as little as possible. Both aspects of the law, that is, the tension between the general terms of the law and the particulars of a case, and the adversarial nature of legal procedures, cause legal reasoning to go beyond the meaning of the legal rules. It involves appeals to precedent, principle, policy, and purpose, as well as the consideration of reasons for and against drawing certain conclusions. For these reasons law relies not just on deduction but on argument.

Nevertheless, deduction is still an essential ingredient in legal reasoning. To start with, the principle of legal certainty requires that the meaning of the law is not arbitrarily set aside. And when arguing that the law should be set aside in a certain case because applying it would have undesirable effects, the effects of applying the law must be deduced. Also, contemplating alternative interpretations of a legal concept involves deducing how the various interpretations affect the outcome of a case. Moreover, deductive techniques have been practically successful, especially in the application of knowledge-based systems in large-scale processing of administrative law, such as social benefit law. Such systems apply computational representations of legislation to the facts as interpreted by the human user. The use of such systems has been proved to greatly reduce two major sources of errors in the processing of social benefit applications by 'street-level bureaucrats': their incomplete knowledge of the relevant regulations and their inability to handle the often complex conditions of the regulations (Svensson, 2002). These systems leave it to the user (the official with the authority to make a decision) to decide whether to accept the system's recommendation or to deviate from it on nonstatutory grounds. Thus these systems do not enforce mechanical application of the law, at least as long as the correctness of their recommendations is not taken for granted. We can conclude that, even though legal reasoning does not equate with logical deduction, the study of the deductive aspects of legal reasoning is important for both theoretical and practical reasons.

Much research on these aspects exist and we can discuss only some of it here. A seminal study of the logical structure of legislation was Sergot et al.'s (1986) modeling of the British Nationality Act as a logic program, which showed how logical programming (and logic more generally) enables intuitively appealing representations that can be directly deployed to generate automatic inferences.

Here is how a legislative rule from the British Nationality Act is modeled as a logical clause:

x is a British citizen.
IF x was born in the United Kingdom AND x was born on date y
AND y is after or on commencement
AND x has a parent who qualifies under 1.1 on date y

Sergot et al. also showed how further clauses can be represented that determine the conditions under which the conditions in the legal rules hold. This work has greatly influenced subsequent research on knowledge-based systems for processing legislation.

Other important work is on the logical characterization of the various legal positions or relations that may exist between normative agents as regards an action or state of affairs, in terms of their rights, obligations, and permissions. This work enables the expression of subtle but important distinctions, such as whether a patient's normative position with regard to access to his or her medical data, besides the patient's permission to access the data, does or does not include the medical staff being forbidden to impede the patient's access. In the first case, the patient has the right to access his or her medical data; in the second case he or she is merely permitted to do so. Sergot (2001) presents a computational method for exhaustively specifying and computing the alternative normative positions of two parties concerning an action. Such methods can be useful, for example, for drafting or disambiguating security or access policies.

Among other work on deductive aspects of legal reasoning we mention methods for representing systems of legal concepts (Bench-Capon and Coenen, 1992) and methods for representing change in legal systems, normative positions, or legal relations over time (Rotolo and Governatori, 2009).

Exceptions and Rule Hierarchies

Any attempt to computationally model legal regulations soon meets two very common structural features of legal regulations that provide obstacles for deductive techniques: the separation of general rules and exceptions, and the use of hierarchies over legislative sources to resolve conflicts between different regulations. With exceptions the problem is that the law often makes legal effects dependent on the assumption that they do not occur as long as there is no evidence for their occurrence. For example, Section 3:32 of the Dutch civil code states that persons have the capacity to perform legal acts (this means, for instance, that they can engage in contracts or sell their property), unless the law provides otherwise. One place in which the law provides otherwise is Section 1:234 of the Dutch civil code, which states that minors have the capacity to perform legal acts if and only if they have consent from their legal representative. If we take a person named John and then consider these two

rules, it follows that John has the capacity to perform legal acts. However, this inference is presumptive or defeasible in that it can be invalidated by further information. For example, if evidence is provided that John is a minor, then the conclusion that he can perform legal acts is invalidated unless evidence is also provided that John has a consent of his legal representative (usually one of his parents).

The making and retracting of such defeasible inferences goes beyond standard deductive models of reasoning. One way in which AI and law has tackled this problem is by the use of so-called nonmonotonic logics. Such logics, which are a result of general AI research, allow the making of inferences subject to evidence to the contrary, and the retraction of such inferences when evidence to the contrary comes in. These logics can also model reasoning with hierarchies. Models of deduction have no room for conflict resolution or hierarchies: when a body of information is logically inconsistent, then standard deductive methods simply come to a halt. In contrast, nonmonotonic logics have been designed in which inconsistencies can be resolved by defining preference relations on rules, and these preferences can be used to express legal hierarchies. This too makes the reasoning defeasible, since new information may make a conflicting rule of higher rank applicable that overrules a previously applicable rule with lower rank. Nonmonotonic logics have been shown useful in modeling legislative rule-exception structures and legislative hierarchies (Prakken and Sartor, 1996), and in modeling legal presumptions and notions of burdens of proof (Prakken and Sartor, 2009; Gordon and Walton, 2009).

Although nonmonotonic techniques technically deviate from deductive logic, their spirit is still the same, namely, of deriving consequences from clear and unambiguous representations of legal rules and facts. The logical consequences of a representation are still clearly defined. While technically most nonmonotonic logics allow for alternative conclusion sets (which capture cases in which conflicts cannot be resolved), in legal practice statutory rule-exception structures and legislative hierarchies still usually yield unambiguous outcomes. More often, conflicts arise not from competing norms but from the variety of ways in which they can be interpreted. A real challenge for deductive accounts of legal reasoning is the gap between the general legal language and the particulars of a case. Because of this gap, disagreement can arise, and it will arise because of the conflicts of interests between the parties.

Rule-Based Accounts of Legal Interpretation

At first sight, it might be thought that disagreements about interpretation are resolved in concrete cases by courts, so that additional interpretation rules can be found in case law. If different courts disagree on an interpretation, such disagreements could be represented with nonmonotonic techniques for handling conflicting rules. This was indeed the approach taken by Gardner (1987), who designed a program for so-called 'issue spotting' in law school contract law exam problems. Given an input case, the task of the program was to determine which legal questions involved were easy and which were hard, and to solve the easy ones. If all the questions were found easy, the program reported the case as clear, otherwise as hard. The system contained domain knowledge of three different types: legal rules, common-sense rules (e.g., on the interpretation of utterances like "Will you supply …?"), and rules extracted from cases. The program considered a question as hard if either 'the rules run out,' or different rules or cases point at different solutions, without there being any reason to prefer one over the other. Before a case was reported as hard, conflicting alternatives were compared to check whether one is preferred over the other. For example, case law sets aside conflicting legal rules or common-sense interpretations of legal concepts. Gardner's program was reconstructed by Gordon (1991) with techniques from nonmonotonic logic. Another approach is Verheij et al.'s Reason-Based Logic (1998), which models reasoning as the weighing of reasons for and against a conclusion, where rules are just one source of reasons, along with, for example, precedents or principles. Thus they could, like Gardner, model a statutory rule being set aside not by a conflicting statutory rule but by other considerations.

A problem with rule-based approaches is that rules derived from precedents are often specific to the case, so a new case will rarely exactly match the precedent, and techniques for handling conflicting rules fall short. Instead, reasoning forms are called for in which case law rules can be refined and modified. Here factors and reasons play an important role, and analogies between cases are drawn and criticized.

Interpreting Legal Concepts with Cases

What are the reasoning forms "when the rules run out"? They can be found in their most explicit form in common-law jurisdictions, in which judicial precedents can be legally binding beyond the decided case, so that court decisions legally constrain the decision in new cases. This leads to reasoning forms where legal rules are formulated by courts in the context of particular cases and are constantly refined and modified to fit new circumstances that were not taken into account in earlier decisions. These reasoning forms can to a lesser extent also be found in civil-law jurisdictions, since interpretations of the law by higher civil-law courts, even though strictly speaking not binding beyond the decided case, still tend to be followed by lower courts.

Perhaps the earliest work in AI and law on legal interpretation was the TAXMAN II project of McCarty (1977, 1995). According to McCarty (1995: p. 285), "The task for a lawyer or a judge in a 'hard case' is to construct a theory of the disputed rules that produces the desired legal result, and then to persuade the relevant audience that this theory is preferable to any theories offered by an opponent." In McCarty's approach, legal concepts have three components: firstly, a (possibly empty) set of necessary conditions for the concept's applicability; secondly, a set of instances ('exemplars') of the concept; and finally, a set of rules for transforming one case into another, particularly for relating 'prototypical' exemplars to 'deformations.' According to McCarty, the way lawyers typically argue about application of a concept to a new case is by finding a plausible sequence of transformations which maps a prototype, possibly via other cases, onto the new case. McCarty's particular modeling of this approach has not found many followers but his general claim that legal interpretation is theory construction has been very influential.

Much AI and law work on the interpretation of legal concepts centers around the notion of a factor, an idea going back to the HYPO system of Ashley (1990) and the CATO system of Aleven (2003). Factors are abstractions of fact patterns that favor (pro factors) or oppose (con factors) a conclusion. Factors are thus in an intermediate position between the specific facts of a case and the legal predicates to which such facts may be relevant. For example, in CATO, which like HYPO argues about misuse of trade secrets, some factors pro misuse are that a nondisclosure agreement was signed, that the plaintiff had made efforts to maintain secrecy and that the copied product was unique; and some factors con misuse are that disclosures were made by the plaintiff in negotiations and that the information was reverse-engineerable.

The HYPO and CATO systems are meant to model how lawyers make use of past decisions when arguing a case. They do not compute an 'outcome' or 'winner' of a dispute; instead they are meant to generate debates as they could take place between 'good' lawyers. HYPO generates disputes between a plaintiff and a defendant of a legal claim concerning misuse of a trade secret. Each move conforms to certain rules for analogizing and distinguishing precedents. These rules determine for each side, which are the best cases to cite initially, or in response to the counterparty's move, and how the counterparty's cases can be distinguished. According to the theory described by Ashley (1989) and implemented in CATO, a case is represented as a set of factors for a decision and a set of factors against that decision, plus the decision that resolves the conflict between the competing factors. A case is citable for a side if it has the decision wished by that side and shares with the current fact situation (CFS) at least one factor that favors that decision. Thus citable cases do not have to exactly match the CFS, which is a way of coping with the case-specific nature of case law decisions. A citation can be countered by a counterexample, that is, by producing a citable case that has the opposite outcome. A citation may also be countered by distinguishing, that is, by indicating a factor in the CFS that is absent in the cited precedent and that supports the opposite outcome, or a factor in the precedent that is missing in the CFS and that supports the outcome of the cited case. HYPO also allows for multivalued factors, called dimensions, to vary the degree to which a factor promotes a certain outcome. For example, a dimension is the number of people to which a trade secret has been disclosed, or the extent to which security measures were taken. A Boolean factor is then a specific value of a dimension. Dimensions allow an additional way to distinguish a precedent, namely, on a shared pro-decision factor that more strongly favors the decision in the precedent than in the CFS.

The HYPO system was embedded in the CABARET system of Skalak and Rissland (1992), which modeled the use of precedents to confirm or contest the application of a rule. The system implemented a hierarchical argumentation model in terms of strategies, moves, and primitives. A strategy is a broad characterization of how one should argue, given one's particular viewpoint and dialectical situation. A move is a way to carry out the strategy, while a primitive is a way to implement a move. For example, when one wants to apply a rule, and not all of the rule's conditions are satisfied, then a possible strategy is to broaden the rule. This strategy can be implemented with a move that argues, using an analogized precedent, that the missing condition is not really necessary. This move can in turn be implemented with HYPO's ways to analogize cases. Similarly, CABARET also permits arguments that a rule, which prima facie appears to cover the case, should not be applied to it. Here the strategy is discrediting a rule and the move may consist of analogizing a case in which the rule's conditions were met but the rule was not applied. Again the move can be implemented with HYPO's ways to analogize cases.

Aleven (2003) developed HYPO (without dimensions) into the CATO system for teaching case-based argumentation skills to law students, also in the trade secrets domain. CATO's main new component was a 'factor hierarchy,' which expresses expert knowledge about the relations between the various factors: more concrete factors are classified according to whether they are a reason for or against the more abstract factors to which they are linked; links are given a strength (weak or strong), which can be used to solve certain conflicts. Thus the factor hierarchy can be used to explain why a certain decision was taken, which in turn facilitates debate on the relevance of differences between cases.

For instance, the hierarchy positively links the factor 'security measures taken' to the more abstract concept 'efforts to maintain secrecy.' Now if a precedent contains the first factor but the CFS lacks it, then not only can a citation of the precedent be distinguished on the absence of 'security measures taken' but also this distinction can be emphasized by saying that thus no efforts were made to maintain secrecy. However, if the CFS also contains a factor 'agreed not to disclose information,' then the factor hierarchy enables downplaying this distinction, since it also positively links this factor to 'efforts to maintain secrecy': the party that cited the precedent can say that in the current case, just as in the precedent, efforts were made to maintain secrecy.

Perhaps the most elaborate representation of cases was produced in Branting's (1999) GREBE system in the domain of industrial injury, where cases were represented as semantic networks. The program matched portions of the network for the new case with parts of the networks of precedents, to identify appropriate analogies.

Various logical accounts of factor-based reasoning with cases have been given. Here the nonmonotonic logics that were originally used to model reasoning with exceptions and legal hierarchies turned out to be useful for this task also. Most of this work applies argumentation-based nonmonotonic logic, in which rules can be repeatedly applied to construct arguments, and in which conclusions are drawn by comparing alternative arguments for or against conclusions. (But some accounts are formulated in terms of weighing sets of reasons for or against a conclusion.) The key idea in these approaches is that existing case decisions give rise to conflicting rules (or conflicting sets of reasons) plus a preference expressing how the court resolved this conflict: In the notation of Prakken and Sartor (1998):

$$r_1 \qquad \text{Pro factors} \Rightarrow \text{Decision}$$

$$r_2 \qquad \text{Con factors} \Rightarrow \text{Not Decision}$$

$$r_1 > r_2$$

The priority expresses the court's decision that the pro factors in the body of rule r_1 together outweigh the con factors in the body of rule r_2. This approach allows for 'a fortiori' reasoning, in which adding factors to a pro-decision rule or removing factors from a con-decision rule does not affect the rule priority. It allows for analogical uses of a pro-decision rule by deleting pro factors, which is called 'broadening a rule.' A broadened rule does not inherit the priority relations of the rule from which it is obtained. So if rule r_1 in our schematic example is broadened to rule r_1' by deleting one of the pro-factors in rule r_1, then one cannot conclude from the priority $r_1 > r_2$ in the precedent that $r_1' > r_2$, since the deleted factor might have been essential in preferring r_1 over r_2. So a decision argued for with a broadened rule is not (defeasibly) implied by a body of precedents.

An interesting question is under what conditions such a decision is still allowed by the body of precedents. This question is addressed by Horty (2011). Consider the Keeble case from the common law of property, part of a well-known series of cases on ownership of wild animals that are being chased. In Keeble a pond owner placed a duck decoy in his pond with the intention to sell the caught ducks for a living. Defendant used a gun to scare away the ducks, for no other reason than to damage plaintiff's business. Here the court held for plaintiff. The pro-plaintiff factors were that plaintiff was hunting for a living (*PlLiving*) and was hunting on his own land (*OwnLand*). The single pro-defendant factor was that the animals were not yet caught (*Not Caught*). The issue is whether plaintiff became the owner of the ducks (Owner). In the notation of Prakken and Sartor (1998), we have

Keeble
k_1: PlLiving, OwnLand $\Rightarrow$ Owner
k_2: Not Caught $\Rightarrow$ Not Owner
$k_1 > k_2$

In another precedent, Young, both plaintiff and defendant were fishermen fishing in the open sea. Just before plaintiff closed his net, defendant came in and caught the fishes with his own net. Here not only the plaintiff but also the defendant was hunting for a living (*DefLiving*). Then we have

Young
γ_1: PlLiving $\Rightarrow$ Owner
γ_2: Not Caught, DefLiving $\Rightarrow$ Not Owner

To decide *Young* for plaintiff, the required priority $\gamma_1 > \gamma_2$ cannot be based on the precedent, since γ_1 lacks one antecedent of k_1, and also since γ_2 adds a con factor to k_2. However, deciding Young in accordance with Keeble is still allowed by Keeble, since that leaves the decision in the precedent unaffected. Horty calls this following the precedent.

This is different if the case base also contains a second precedent, which is almost like Keeble except that the defendant also hunted for a living and in which the defendant won.

Precedent 2
p_1: PlLiving, OwnLand $\Rightarrow$ Owner
p_2: Not Caught, DefLiving $\Rightarrow$ Not Owner
$p_2 > p1$

The priority $p_2 > p_1$ then implies $\gamma_2 > \gamma_1$, since γ_2 has the same con-decision factors as p_2 while γ_1 lacks one pro-decision factor of p_1. But $\gamma_2 > \gamma_1$ is inconsistent with $\gamma_1 > \gamma_2$, so deciding *Young* as *Keeble* is not allowed by the extended case base, since it would amount to overruling the second precedent.

In Horty's approach not all deviations from a precedent are overrulings. Suppose that precedent 2 is not in the case base but is a new case, so its decision is not yet known. Then $p_2 > p_1$ is consistent with $k_1 > k_2$, so deciding the new case differently than in the precedent is allowed by the case base, since it leaves all decisions in precedents unaffected. Horty here says that deciding con the original decision in the new case *distinguishes* the precedent. Horty has thus given precise logical formalizations of the important common-law notions of following, distinguishing, and overruling a precedent.

These approaches have been extended by allowing for chains of reasoning from more concrete to more abstract factors, so that detailed reasoning about how the factors relate to a conclusion can be modeled (cf CATO's factor hierarchy). For example, Prakken and Sartor (1998), using an idea of Loui and Norman (1995), represent cases in general as multistep arguments for and against conclusions, where rule priorities are expressed for each pair of conflicting rules, and where any rule or priority of a precedent can be used in a new case. This makes it possible to argue in various ways that in a new case some of the arguments pro the decision cannot be constructed or new arguments con the decision can be constructed, so that the new case must have a different outcome (cf Loui and Norman, 1995).

The work on chains of reasoning and dialectical structures does not explain why the most abstract factors are factors pro or con a decision. Berman and Hafner (1993) argued that often a factor can be said to favor a decision by virtue of the purposes served or values promoted by taking that decision because of the factor. A choice in case of conflicting factors is then explained in terms of a preference ordering on the purposes, or values, promoted or demoted by the decisions suggested by the factors. Cases can then be compared in terms of the values at stake rather than on the factors they contain.

Bench-Capon (2002) computationally modeled this approach and illustrated it with the series of cases from American property law on ownership of wild animals that are being chased. For example, plaintiff in *Keeble* could argue that people should be protected when pursuing their livelihood, since society benefits from their activities. He could also argue that he was hunting on his own land, so that the value of protection of property is another reason why he should win. Defendant in *Keeble* could argue that since plaintiff had not yet caught the ducks, he had no right to the ducks, since if such rights depended on who first saw the animals, there would be no clear criterion and the courts would be flooded with cases. Thus defendant argues that deciding for him promotes the value of legal certainty. Since plaintiff won in *Keeble*, we can, on this interpretation of the case, say that the court found that the combination of the values of protecting property and protecting the pursuit of livelihood outweighs the single value of legal certainty. This value preference can be cited in new cases where the same values are at stake (but note that in *Young* the value of protecting the pursuit of livelihood is cancelled out by the fact that in *Young* the defendant was also pursuing his livelihood).

A limitation of this approach is that often the extent to which a value is promoted or demoted is also important. Even if a new case contains the same values as a precedent, the degrees of promotion or demotion may be different, which can give rise to arguments against the citation. This could explain why in legal practice almost no generally valid hierarchies of values are accepted: the point is that different degrees of promotion or demotion give rise to different value preferences in different cases.

Bench-Capon and Sartor (2003) embedded Bench-Capon's (2002) approach in a method for constructing theories that explain a given set of cases. They modeled theory construction as an adversarial process, where both sides take turns to modify the theory so that it explains the current case in the way they want. The process starts with a set of statements about which factors promote which values and a set of cases represented in terms of factors and an outcome. Then the theory is constructed by creating rules plus rule preferences derived from value preferences. Chorley and Bench-Capon (2005) study various ways to automate this process.

The attention paid to the role of value and purpose led to accounts of legal interpretation as a decision problem, namely, as a choice between alternative interpretations on the basis of the likely consequences of these interpretations in terms of promoting and demoting values. Thus current AI models of argumentation for decision making can be applied. This approach in fact regards legal reasoning as a form of what philosophers call practical reasoning. It compares arguments about what decision to take in terms of the various positive and negative effects of the decision alternatives on goals and values, in terms of the relative preferences between these goals or values, and sometimes also in terms of the extent to which they are promoted or demoted. This line of research has especially been pursued by Bench-Capon and Atkinson and colleagues, for example, in Atkinson et al. (2005), applying it both to legal interpretation and to legislative and policy debates.

A practical-reasoning account of legal interpretation can be applied to model the problem of a court deciding whether to follow or distinguish a precedent when a new factor arises (assuming that distinguishing is consistent with the body of precedents). For example, deciding *Young* for the defendant can be reconstructed as follows. First practical-reasoning arguments for following or distinguishing *Keeble are stated.* Then the argument for distinguishing *Keeble* is preferred over the argument for following *Keeble*, on the ground that following *Keeble* only promotes the value of protecting livelihood while distinguishing *Keeble* in addition promotes the value of legal certainty.

The work reviewed in this section does not amount to a full theory of interpretative legal argument. One thing hardly addressed in the above models is the step from facts to factors. Further study is needed of how legal reasoning actually bridges the gap between the concrete facts and the more abstract factors in a case.

Establishing the Facts of a Case

While legal education and scholarship mostly focuses on reasoning with and about the law, in practice most cases are decided on the facts, so insight as to how facts can be proven is crucial for legal practice. AI and law research has addressed two main questions: which model of rational proof can best be applied to the law, and what is the logical nature of important legal evidential constructs like burdens of proof and presumptions? We address these issues in turn.

Models of Legal Proof

Theoretical models of rational legal proof are generally of three kinds: probabilistic, story-based, or argument-based. All three approaches acknowledge that evidence cannot provide watertight support for a factual claim but always leaves room for doubt and uncertainty, but they account for this in different ways. Probabilistic approaches express uncertainty in terms of numerical probabilities attached to hypotheses given the evidence. Often a Bayesian approach is taken, nowadays more and more with Bayesian networks (Fenton and Neil, 2011). Probabilistic approaches are by no means uncontroversial. One objection is that in legal cases the required numbers are usually not available, either because there are no reliable statistics, or because experts or judges are unable or reluctant to provide estimates of probabilities. Another objection is that probability theory imposes a standard of rationality that cannot be attained in practice, so that its application would lead to more instead of fewer errors. To overcome these and other claimed limitations of probabilistic models, argumentation-based and story-based models have been proposed.

Story-based approaches go back to the work of the psychologists Bennett and Feldman (1981), who observed that the way judges and prosecutors tend to make factual judgments is not by probabilistic or logical reasoning but by constructing and comparing alternative plausible stories about what might have happened. In these approaches, the story that best explains the evidence must, if it does so to a sufficient degree, be adopted as true. Room for doubt is provided since some as yet unknown story might be the true one or since new evidence might make another of the known stories the best one. Thagard (2004) sketches how this approach can be computationally modeled as inference to the best explanation.

Both Bayesian and story-based approaches reason from hypotheses to the evidence in that, to assess alternative hypotheses, they model how likely the evidence is under the various hypotheses. In contrast, argumentation-based approaches reason from the evidence to the hypothesis, by stepwise building evidential arguments from the available evidence to the hypotheses. Room for doubt is provided since additional evidence might give rise to new arguments that defeat the currently undefeated arguments. These approaches go back to Wigmore's (1931) charting method of legal evidence, with which alternative arguments from evidence to hypotheses can be graphically displayed and thus sources of doubt in these arguments can be revealed. An important source of doubt is the empirical generalizations needed to justify the various steps in an evidential argument, such as that witnesses usually speak the truth. Generally, three sources of doubt in witness testimonies are considered: the witness has reason to lie, the witness has flawed memory, or the witness could not reliably observe, hear, feel, or smell

what he testified to. Bayesian and story-based approaches account for this by considering four hypotheses: the witness statement is correct, the witness lied, the witness misremembered, or the witness observed incorrectly. They would then estimate how likely the fact that the witness made his or her statement is under these alternative hypotheses. By contrast, argumentation approaches would defeasibly infer from the witness statement that the accused did what the witness testified to, and they would account for sources of doubt as giving rise to counterarguments.

Bex et al. (2003) model the Wigmorean approach in terms of logical frameworks for argumentation. Evidential reasoning proceeds by applying various argument schemes for evidential reasoning to the evidence, such as schemes for perception, memory, induction, applying generalizations, reasoning with testimonies, and temporal persistence. The so-called critical questions of these schemes specify exceptions to these reasoning forms.

Argumentation approaches are good for modeling how evidence can be related to hypotheses and for revealing sources of doubt in evidential arguments, but less good for providing a clear overview of masses of evidence. This is better done in the story-based approach, which formulates scenarios with a central action made plausible by the context. To combine the strengths of both approaches, Bex (2011) proposed a hybrid theory of legal evidential reasoning. The idea is that stories or scenarios are connected events while evidence for these events and support for their connections is provided by argumentation with argument schemes. Then Bex formulated various criteria for the internal plausibility and coherence of a story and for how well it is supported by the evidence.

Burdens of Proof and Presumptions

Legal proof is not a scientific problem but takes place under legal and practical constraints. The parties involved in a proceeding have limited technical and financial resources, while a decision has to be reached within reasonable time and in a fair way. Legal systems have developed ways to deal with these constraints, such as presumptions and burdens of proof. Research has been done on modeling these notions with techniques from nonmonotonic logic and argumentation (Prakken and Sartor, 2009; Gordon and Walton, 2009). Briefly, the idea is that a burden of proof for a claim is fulfilled if at the end of a proceeding the claim is acceptable according to the argumentation logic applied to the then available evidence. Some care has to be taken here to model that in the law burdens of proof for different sub-issues (including both burdens of production and burdens of persuasion) can be distributed over the parties. Another challenge is to account for the fact that different kinds of legal issues can have different standards of proof. For example, in common-law jurisdictions claims must in criminal cases be proven 'beyond reasonable doubt' while in civil cases usually proof 'on the balance of probabilities' suffices. In logical accounts defeat between arguments is an all-or-nothing matter, but proponents of probabilistic approaches might say that this fails to respect that defeat between evidential arguments is a matter of degree. Gordon and Walton (2009) and Prakken and Sartor (2011) study ways to reconcile the gradual nature of proof standards with the all-or-nothing nature of defeat between arguments in argumentation logics.

Legal presumptions obligate a fact finder to draw a particular inference from a proved fact. Typical examples are a presumption that the one who possesses an object in good faith is the owner of the object, or a presumption that when a pedestrian or cyclist is injured in a collision with a car, the accident was the driver's fault. Some presumptions are rebuttable while others are irrebuttable. Prakken and Sartor (2009) argue that rebuttable presumptions can be logically interpreted as defeasible rules, so that reasoning with rebuttable presumptions can be modeled with a nonmonotonic logic.

Legal Reasoning and Legal Procedure

Legal reasoning usually takes place in the context of a dispute between adversaries, within a prescribed legal procedure. This makes the setting inherently dynamic and multiparty. The facts and theories are not given at the start of a case, but the adversaries advance their points of view and provide their evidence at various stages, and they accept, reject, or challenge their opponent's claims when these are made. The adjudicator can allocate burdens of proof and rule about admissibility of evidence or arguments during a proceeding, before he or she decides the dispute in the end. All these things mean that the quality of a legal decision not only depends on its grounds but also on how it was reached. It is therefore relevant to study how legal procedures contribute to the quality of a decision. In short, legal procedures should promote rational, fair, and effective dispute resolution.

AI and law research has studied these issues by embedding argumentation models like the ones discussed above in dialogue models of legal procedures. The procedures modeled are not actual but artificial ones, often simplified compared to actual legal procedures. The point of this is partly analytical: by formalizing and studying simple artificial legal procedures, insight can be obtained as to the properties of actual legal procedures. But this also has a normative point. Desirable properties for legal procedures can be precisely formulated, that is, properties that make procedures fair and/or effective, and whether these procedures have these properties can be formally or computationally investigated. For example, a fairness property is that if the participants' joint knowledge bases logically (according to an argumentation logic) imply a certain outcome, then the procedure allows a dialogue in which this outcome is reached. Insights thus obtained about artificial procedures can then be used in (re-)designing actual legal procedures.

An influential computational model of a legal procedure was Gordon's (1994) Pleadings Game, which formalized a normative model of pleading, founded on first principles. It was meant to identify the issues to be decided at trial, given what the parties had claimed, conceded, challenged, and denied in the pleadings phase and what (defeasibly) follows from it. Other games (usually two-party) define the outcome in terms of whether the adversaries in the end agree on the main issue, while Prakken (2008) defines a three-party game where in the end an adjudicator (e.g., a judge or a jury) decides the dispute.

The dynamic and multiparty setting of legal procedures also raises issues of strategy and choice. One of the few

investigations of these issues in a legal context is by Riveret et al. (2008), who apply a combination of game theory and argumentation logic to the problem of determining optimal strategies in debates with an adjudicator. In such debates, the opposing parties must estimate how likely it is that the premises of their arguments will be accepted by the adjudicator. Moreover, they may have preferences over the outcome of a debate, so that optimal strategies are determined by two factors: the probability of acceptance of their arguments' premises by the adjudicator and the costs/benefits of such arguments.

Conclusion

Computational models of legal reasoning aim to respect that the central notion in legal reasoning is not deduction but argument. Deduction has its place in legal reasoning, but only as part of a larger model of constructing, attacking, and comparing arguments. Moreover, computational models of legal reasoning aim to respect that rules are not the only source of legal knowledge: the roles of cases, principles, purposes, and values should not be ignored, and these models stress the importance of dynamics, procedure, and multiparty interaction. While most work has addressed legal interpretation and normative determinations, some work is addressing legal proof. Here too, deduction is just one of the tools, as part of either probabilistic, argumentation-based, or narrative approaches. A main concern here is developing models of legal proof that are rationally well founded but respect the practical and cognitive constraints faced by the participants in court proceedings.

Abstract

The author sketches the history of legal scholarship and the relation of law to other academic disciplines. First, jurisprudence and doctrinal studies between 1900 and 1970 are reviewed, beginning with legal formalism; moving to its principal critiques, legal realism and legal positivism; and concluding with the rehabilitation of law as a coherent body of doctrine. Between 1970 and 1985, further attacks on the concept of law came from the Law and Economics Movement and from the Critical Legal Studies Movement. Developments in the late twentieth and early twenty-first centuries include post-Chicago School economics, 'outsider scholarship' (e.g., feminist and critical race theory), a revised form of 'standard' legal scholarship, and the growth of sociolegal and empirical legal studies.

Legal scholarship can be distinguished from scholarship about law, such as the history of law or the sociology of law, by virtue of its internal perspective (Dworkin, 1986; Hart, 1961). This means that it treats law as a set of norms that can be analyzed according to their internal coherence and moral significance, rather than as one component of a social system whose contours and content are determined by the same forces that affect other aspects of the society. Within the boundaries of this internal approach, there has traditionally been a division between jurisprudence, which concerns the theory of law, and doctrinal studies, which concern specific legal provisions. In recent years, however, both the distinction between internal and external perspectives and that between jurisprudence and doctrinal studies have been significantly eroded by intellectual developments (Abel, 1973) such as law and economics, critical legal studies, critical race theory, feminist legal theory, gay legal studies, sociolegal studies, and empirical legal studies. These developments have deployed the methodologies of other disciplines in the analysis of the internal structure and moral significance of law. At the same time, they have made the study of particular legal doctrines more theoretical and rendered legal theory less unified and more subject specific. While the distinctions between legal scholarship and scholarship about law, and between jurisprudence and doctrinal studies, remain useful, they now refer to bodies of scholarship with generalized family resemblances, rather than distinct methodologies with clearly defined boundaries.

Jurisprudence and Doctrinal Studies between 1900 and 1970

The Attack on Formalism

In the early years of the twentieth century, doctrinal studies in both the Continental and the Anglo-American worlds were dominated by an approach that can be described as legal formalism, or conceptualism (*see* Legal Formalism). Its essential premise was that the law is an autonomous system, based on general principles, that is accessible to reason and that effectively guides judges when they decided contested cases (Schauer, 1988). Formalism did not necessarily advance the natural law idea that this system represented transcendental truth (*see* Natural Law), nor the naïve idea that judicial decisions could be derived from general principles by mechanistic or syllogistic logic (Tamanaha, 2010), but it did claim that law was animated by a generalized conceptual structure that transcended particular political or policy positions. In Continental Europe, the source of this autonomous system was regarded as each nation's legal code; in Great Britain and the United States, it was the common law. By virtue of the claim that law is autonomous, and the rather close focus on judicial decisions, both versions of formalism were somewhat insulated from major jurisprudential movements such as Marxism and sociological jurisprudence.

The attack on formalism came from two sources. The first, generally described as legal realism, asserted that judicial decisions and legal concepts are indeterminate or contextual, that they are the product of social attitudes rather than reasoned analysis, and that they are subordinated to the political process rather than transcending it (*see* Legal Realism). American legal realism emphasized the incoherence of general legal principles, the indeterminacy of judicial decisions, and the dependence of these decisions on the particular views of the judge. Continental realism, which was centered in Scandinavia, emphasized the contextual nature of legal concepts and their dependence upon more general social attitudes. A related line of attack was sociological jurisprudence, which attempted to develop an alternative conception of law as determined by, and contributing to, more general social forces (Ehrlich, 1975). This was connected with the work of anthropologists and sociologists who treated law as an aspect of social systems, particularly those without formal legal institutions. A number of leading American realists saw the sociological approach as an alternative to doctrine, and a few tried to study legal behavior as a sociological phenomenon (Llewellyn and Hoebel, 1941; see Schlegel, 1995).

Apart from the legal realist and sociological approach, the dominant theme in early twentieth-century jurisprudence was legal positivism (*see* Legal Positivism). According to Kelsen, law is the set of threats promulgated by public officials whose authority is established by a (fictitious) single, agreed-upon principle, or *Grundnorm* (Kelsen, 1967) As such, it is completely separate from morality; a particular normative statement is a law if, and only if, it has been duly promulgated by

a recognized public official, or by a private party who has been delegated to act by such a recognized official. Legal positivism was motivated partially by larger philosophic trends (such as logical positivism) and partially by the effort to refute natural law jurisprudence. While its connection with doctrinal studies is not self-evident, it seems consistent with American realists' rejection of general common law, that is, the idea that legal rules can be derived from general principles and need not correspond to the decisional law of any specific jurisdiction, and with the Scandinavian realists' insistence that there are no overarching legal concepts, but only concepts specific to particular societies.

The Rehabilitation of Law

The years following World War II saw renewed interest in the concept of law in both jurisprudence and doctrinal studies. In jurisprudence, scholars began searching for a way to reinfuse some sense of social morality into the concept of law, so that one would not be required to apply that term to the rules promulgated by a generally immoral regime such as Nazi Germany. This led to a revival of natural law (Finnis, 1980), but the appeal of this work was limited by its continuing religious overtones (*see* Natural Law). More influential was Fuller's effort to articulate a purely procedural version of natural law (Fuller, 1964), which asserted that any declarations that one would be willing to regard as law must have certain universal characteristics such as generality, constancy, and nonretroactivity. Still more influential was Hart's recharacterization of legal positivism in light of Wittgenstein's linguistic theory (Hart, 1961). Law, in Hart's view, is a complex set of social rules, consisting of 'primary' rules that not only impose sanctions but also create a sense of obligation among citizens, and 'secondary rules' that state the manner in which public officials impose the primary rules, develop new rules, and empower action by private parties that will be enforced by public authorities.

Doctrinal scholarship rejected legal realism more definitively than jurisprudence rejected legal positivism. In the United States, the legal process school conceded that the legal system was subordinate to politics, thus acknowledging positivism's essential claim, but insisted that the concept of law retained an important role within this more limited sphere of action. Fuller argued that reasoned decision making according to rules established in advance is the best way to adjudicate disputes between parties, although a poor way to formulate new social policy (Fuller, 1978). Other members of this school explored the rationales by which the courts could use the US Constitution to evaluate, and, if necessary, strike down legislation, without substituting its political judgment for that of the legislature (Bickel, 1962; Wechsler, 1959). Central to this inquiry was the belief that doctrine possessed an inherent logic or coherence, so that judges could reach generally accepted conclusions by means of reasoned argument. An important corollary was that public officials, particularly judges, generally acted in the public interest, and that their decisions harmed social welfare only when they strayed beyond the limits of their institutional competence.

In Europe, theories of judicial decision making focused on statutory interpretation, which generally (although not in Britain) meant the interpretation of a comprehensive civil or criminal code. Many scholars asserted, or assumed, that judges could reach generally accepted conclusions by means of reasoned argument if they followed and extrapolated the inherent logic of the code (MacCormick and Summers, 1991). As in the case of the American legal process school, this work was premised on the idea that doctrine was coherent within a politically defined area of proper operation. Because it concerned interpretation of a legal code, rather than common law or a vaguely worded constitution, it was more closely allied to legal positivism than its American equivalent. Both the American and European versions of this postwar approach were sufficiently focused upon law's internal rules to minimize the influence of social science studies of law.

The Critique of Law, 1970–85

Law and Economics

The attack on this rehabilitated concept of law was initiated primarily in the United States, and came from two sources that were associated with opposite ends of the American political spectrum. The first was the Law and Economics Movement, which was derived from the Chicago School of microeconomics and shared its basic premise that all social action is a rational effort to maximize the actor's material self-interest (*see* Law and economics). According to this approach, legislators are motivated solely by their desire to be reelected (assuming that effective sanctions exist against outright bribery); thus, the laws they produce have no inherent logic, and no necessary relation to the public interest. While these laws might correspond to the preferences of voting citizens, they are more likely to reflect the distorting influence of special interest groups that can organize and raise funds more effectively than the general public (Olson, 1965). A judge who is interpreting such laws cannot be guided by their internal logic; all he or she can do is enforce the bargain that the interest groups reached, or interpret the law narrowly in deference to public values (Easterbrook, 1983; Macey, 1986). Posner originally asserted that the common law, as opposed to statutory law, represented a coherent body of doctrine that implemented the social policy of efficiency (Posner, 1972). Other law and economics writers soon abandoned this implausible contention and devoted their efforts to analyzing the self-interested motivations that lead private parties to engage in or to avoid litigation, and that lead lawyers to encourage or discourage them from doing so, to settle cases, or to adopt specific trial strategies (Priest and Klein, 1984). This work suggests that common law, like statutory law, lacks any conceptual coherence, and is merely the product of economic forces.

In addition to its analysis of doctrine, the Law and Economics Movement advances the jurisprudential position that the only proper purpose of law, or of government in general, is to achieve economic efficiency, that is, to maximize the nation's wealth (Posner, 1972). When combined with the economic analysis of law, this leads to the conclusion that regulatory law is generally undesirable and that the social control of economic relations should be left to the market. The argument seems more political than legal, in that it addresses the purpose of law rather than its nature, and it is clearly related to the conservative politics of most of the early

law and economics scholars. But it also represents a theory of law, in that it advances a general rule that identifies improper laws and improper roles for legal actors.

Critical Legal Studies

The Critical Legal Studies Movement was derived, albeit rather loosely, from the critical theory of the Frankfurt School. It revived the realist claim that law, both statutory and decisional, is not an internally coherent system but a collection of unrelated rules. Unlike legal realism, however, critical legal studies asserted that the reason for this lack of coherence is that law is a device by which the political elite maintains its hegemony, or social control (Horwitz, 1977; Unger, 1975). It is a particularly effective device, moreover, because the widely accepted claim that law is coherent or logical masks its class-oriented character; in effect, it creates a false consciousness among the disadvantaged that leads them to accept their subordinated status (*see* Critical Legal Studies). With respect to doctrine, critical legal studies scholars sought to disprove the claim that legal decisions are logical or coherent, and thereby to reveal the hegemonic purposes of these decisions. In undertaking this analysis, they went beyond the legal realists' demonstration of the internal inconsistencies of doctrine, invoking various aspects of Continental thought such as deconstruction and postmodernism to demonstrate that any claim to linguistic coherence is essentially fraudulent.

This analysis of doctrine is linked to the jurisprudential position that the social dominance of the elite, and its use of law to secure its position, is profoundly immoral. A just society achieves equality among its members – if not complete equality, then certainly a much higher degree of equality than contemporary society displays. Thus, modern society needs to be emancipated from its existing social structures and from ideologies, including law, which maintain those structures and preach their legitimacy to the disadvantaged. Again, this is essentially a political argument, with an obvious connection to the progressive or radical politics of critical legal studies scholars. But again, it constitutes a general theory of law by distinguishing between the improper, hegemonic purposes of law and its proper, emancipatory purposes.

Despite their obvious differences in political orientation, law and economics and critical legal studies rest on closely related insights and exercise similar impacts on the character of legal scholarship. Both movements renew the realist attack on law's doctrinal coherence, and both go beyond realism by grounding this attack on a political analysis. In both cases, moreover, that analysis asserts that law is produced by political and economic elites for the purposes of securing their positions. By thus attributing the incoherence of doctrine to political causes, both law and economics and critical legal studies join doctrinal analysis to larger jurisprudential questions in a manner that was not true for legal formalism, legal realism, or the legal process school. The two movements are further allied in their heavy dependence upon nonlegal methodologies. For the first time, two large groups of legal scholars were prepared to abandon the idea that law is an autonomous or quasi-autonomous system that provides its own analytic tools, and look to other disciplines for the main elements of their analytic framework (Rubin, 1988).

The Topography of Legal Scholarship in the Early Twenty-First Century

Law and Economics

Law and economics remains a robust tradition within legal scholarship, and much work continues to be done according to the Chicago School model that assumes rational, self-interested actors and smoothly functioning markets. But the criticisms of this approach by legal scholars, combined with the internal evolution of the field, have led to an increasing body of post-Chicago Law and Economics scholarship. One theme of this work, reflecting developments in economics itself (Williamson, 1985), is that institutional arrangements exercise powerful effects in structuring behavior. Since legal actors generally function in an institutional context, this has proved to be a productive line of inquiry. Positive political theory and game theory, which treat institutions themselves as rational actors, have also been utilized in current legal scholarship to take institutional factors into account (Cooter, 2000; Georgetown Law Journal, 1992; Rodriguez and Weingast, 2003). A second, and related, theme is that internalized norms exercise powerful effects that conflict with the self-interest, or at least the immediate self-interest, of the actor. Some scholars argue that legal rules can be regarded as internalized norms that reflect varying degrees of long-term rational self-interest (University of Pennsylvania Law Review, 1996); others assert that particular communities, such as merchants in a given trade (Bernstein, 1996; Cooter, 1996), or farmers in a given area (Ellickson, 1991), engage in heavily norm-determined behavior that strongly affects the impact of official law on these communities. The combined effect of focusing on institutions and on norms has been to modify, without eliminating, the external perspective that law and economics generally adopts. Law is not being treated as presumptively coherent, but its internal structure is being given a role that followers of the Chicago School tend to deny.

Still another influence on law and economics has been the attack on human rationality by cognitive psychologists (Kahneman et al., 1982). This work, which is heavily empirical, has revealed that people, at least in laboratory settings, are irrationally optimistic, irrationally attached to the status quo, and irrationally influenced by the way that choices are presented. Legal scholars have applied these results to a variety of settings, such as jury decisions, contracting behavior, and policy making, and have also begun conducting their own empirical research to study behavior that is relevant to specific legal situations (Gunningham et al., 2003; Jolls et al., 1998; Hans, 2000; O'Connell, 2008; Vanderbilt Law Review, 1998). Thus, the effort to develop an account of human behavior that is more realistic and more modulated than the rational actor model of law and economics has led to the extensive incorporation of a second discipline, psychology, into legal scholarship.

Outsider Scholarship

Critical legal studies has been succeeded by a series of movements that tend to refer to themselves as Outsider Scholarship.

They include critical race theory, feminist theory, and gay legal studies (*see* Critical Race Theory; Feminist Legal Theory; Sexual Orientation and the Law). While critical legal studies remains a viable approach that continues to generate a certain amount of legal scholarship, its role within the academy has been largely replaced by these latter movements, which share its critical approach but contest its particular conclusions. Outsider Scholarship, like critical legal studies, asserts that law is an instrumentality of hierarchy and social domination, but it rejects economic class analysis as an explanation for this phenomenon. Instead, it argues that more specific prejudices are involved, namely, the prejudice of the racial majority against minorities like African-Americans, Latinos, and Native Americans, the prejudice of men against women, and the prejudice of heterosexuals against gays and lesbians (Bell, 1987; MacKinnon, 1989; Eskridge, 1994). These biases may be explicit or implicit (Greenwald and Krieger, 2006; Levinson and Smith, 2012).

One result of this approach is to create a critical scholarship with a more direct connection to American politics; while class has never been a salient political issue in the United States, race, gender, and sexual orientation are all subjects of active political movements. Another, and not unrelated result, has been to decrease the breadth of the critical attack on law. Critical legal studies tended to regard law in its entirety as an oppressive device that hides its true effect behind a facade of objectivity. Outsider scholarship, because it concerns social phenomena that are less comprehensive than class, views law as oppressive because it has denied outsiders the benefits it grants to the dominant group. Its prescription, therefore, is not to abandon or even transform law, but to provide law's benefits to the outsiders, fulfilling the promise of equality that it has thus far denied.

The effect of this outsider scholarship is thus to modify the external perspective of its predecessor. Law is still viewed with suspicion, but its role as a system with internal values is affirmed. For example, instead of arguing that rights are illusory, or an impediment to genuine equality because they can only be validated through litigation, outsider scholarship tends to argue that the disadvantaged cannot afford to wait for such comprehensive transformations, but should use the concept of rights to achieve a more limited but more accessible equality within the existing system (Williams, 1991).

Outsider scholarship shares the critical legal studies view that legal concepts are social constructions that serve specific purposes, often those of dominant elites, and that these concepts are radically indeterminate. But it has not relied as heavily on the indeterminacy argument. As many scholars have pointed out, the argument is itself too indeterminate, since it lacks the criteria to judge how determinate the law could be, and how much determinacy is desirable (Kress, 1989). In addition, most legal scholars recognize that the indeterminacy argument does not necessarily lead to the political conclusions that critical legal studies advanced. Thus, outsider scholarship analyzes legal rules in fairly traditional terms. Its methodological innovation has been its extensive use of narrative, or storytelling, as a means of communicating the personal experience of oppression that racial minorities, women, or gays and lesbians have experienced (e.g., Bell, 1987; Williams, 1991). While this has a literary quality (when done well, at least), it is not related to literary criticism or to the methodology of any other discipline. Rather, it is a technique that is intended to appeal to the values of the reader within the framework of legal scholarship and the legal system.

Standard Legal Scholarship (Reformulated)

Throughout the period when law and economics and critical legal studies were articulating their critique of law and of the legal process school, standard legal scholarship continued to be written. At that time, and at present, it continues to constitute the largest proportion of the legal scholarship being produced. It is standard not only because of its quantity, but also because it is not explicitly identified with any particular school of thought or methodology. In fact, this scholarship can be loosely regarded as a continuation of the legal process school. Like legal process, it acknowledges that law is subordinate to politics, but treats legal rules as a body of doctrine that has enough coherence to generate analytic standards. In addition, it shares the legal process view that not only the participants in the legal system, particularly judges, but also legislators and administrators, are public-oriented enough so that scholarly prescriptions for improving their decisions can be addressed to them (e.g., Choper, 1980; Dworkin, 1986; Ely, 1980). The standard scholarship that is currently being produced differs from its predecessors because it has at least partially absorbed the lessons of both law and economics and critical legal studies, although without accepting their critique of law's legitimacy (Rubin, 1996).

Most legal scholars now acknowledge that viewing legal actors as public oriented is problematic. They recognize that these actors are sometimes motivated by their material self-interest and sometimes intent on preserving existing hierarchies and class relations. Thus, they do not see the legal system as a realm of reasoned, public-oriented decision making that transcends politics, as legal formalism did, nor as a realm of reasoned, public-oriented decision making that is circumscribed by politics but insulated from it, as legal process did. Rather, politics both sets the limits of the legal system and intercalates itself into particular legal decisions. But standard scholarship rejects the notion that decision makers are motivated by any uniform value system, whether it is self-interest, prejudice, or public orientation; the prevailing attitude seems to be that some degree of conscientiousness can be assumed, but that the actual motivations must be sorted out in particular situations.

Methodologically, standard scholarship has assimilated the idea that law is not a quasi-autonomous system that provides its own analytic tools. Scholars regularly rely on informal law and economics or public choice insights in analyzing the behavior of public officials, and, to a lesser extent, on the insights of critical theory. More importantly, these scholars regularly incorporate data from other fields, such as political science, sociology, economics, and psychology, in framing recommendations. The criterion for stating that a particular legal decision, whether by a judge, legislator, or administrator, is incorrect, or could be improved, is less likely to be the internal coherence of legal doctrine and more likely to be some judgment about social welfare. Such judgments will frequently involve empirical information generated by another discipline and will almost always acknowledge,

implicitly if not explicitly, that such information is relevant to the conclusion.

Contemporary Sociolegal Studies and Empirical Legal Studies

These developments in law and economics, outsider scholarship, and standard legal scholarship represent a process, extending over the entire course of the twentieth century and into the first decades of the twenty-first century, by which the distinctions between internal and external scholarship, and between jurisprudence and doctrinal studies, have been partially effaced. This process has important implications for the prevailing conception of legal knowledge, implications that can be illustrated by considering a fourth aspect of contemporary scholarship, namely, sociolegal studies, empirical legal studies, and new legal realism. The strength of these approaches, and their importance for the future, is their consistency with modern law and economics, outsider scholarship, and the reformulated version of standard legal scholarship. In fact, empirical legal studies can be used to support and advance any of these approaches, in addition to serving as a methodology of its own.

The sociology of law, as developed by nineteenth-century scholars such as Maine and Savigny, was originally a jurisprudential position, articulated in opposition to the universalist claims of both natural law and the Napoleonic Code. Its basic insight was that law is the product of particular cultures. With the growth of academic sociology and anthropology, this became translated into detailed studies of legal behavior that were not only more specific, but also more external to the legal system that they studied. Rather than focusing on the internal coherence of the system, or the experience of its participants, sociolegal work treated law as a phenomenon to be determined by examining the behavior of relevant actors. Legal scholars typically ignored such studies because they regarded law as a self-contained, meaningful system that generated its own criteria of analysis.

In response to the attack on the entire concept of law by law and economics and critical legal studies, most legal scholars now recognize that law possesses only a provisional coherence. Its value is no longer determined by its internal logic, but by its ability to achieve political and social goals. For most scholars, however, law is not simply a set of unrelated provisions that achieve these goals, but a system with both institutional and conceptual features. To have legal knowledge, one must be familiar with the features of this system; to use this knowledge, one must make predictions, or prescriptions, about the way this system achieves independently determined goals. Thus, data from fields such as economics, sociology, political science, anthropology, and psychology become directly relevant to legal scholarship (Edelman, 2001). Some of these data come from work that is not specifically concerned with law, such as organization theory or cognitive psychology, but a good deal come from modern sociolegal studies, where law is the social scientist's explicit concern. But this work, however useful, does not displace legal scholarship. The legal scholar still has a crucial role in determining how such data will be used by the institutional and conceptual elements of the legal system (Nourse and Shaffer, 2009). In fact, legal scholars have recently begun to reemphasize these conceptual elements, arguing that, within a richly described social context, law possesses a wide range of symbolic and constitutive roles (Habermas, 1996; Lessig, 1995; Luhmann, 1995) (*see* Law, Autopoiesis in; Law as Constitutive). Sociolegal scholars have come to recognize this as an empirical fact, and have thus taken advantage of legal scholarship's greater receptivity to social science data by engaging more fully with the internal features of the legal system. The result is a partial effacement of the distinction between external and internal scholarship, without its complete elimination.

The challenge to the concept of law, the multiplicity of responses, and the greater methodological range of the resulting scholarship has also partially effaced the distinction between jurisprudence and doctrinal studies. Even when they are engaged in the detailed analysis of doctrine, scholars now realize that they must often confront basic questions about the nature and purpose of law, and the nature of legal knowledge. Such questions can be ignored, of course, in the interest of simplicity, but the work will be open to challenge by those who question its basic premises. Again, the distinction has not been entirely eliminated; as a practical matter, many scholars content themselves with an analysis of doctrine within one or another subdiscipline of legal scholarship and let others fight the more theoretical battles on their behalf. But most recognize that the status of their work as legal knowledge depends on theoretical arguments in a more immediate way than was true a century before.

These developments can be illustrated by considering some of the principal topics of modern sociolegal studies. One notable social science approach to judicial decision making in the early postwar era was the judicial attitude studies that treated court decisions as a pure reflection of the judge's ideology, uninfluenced by legal doctrine (Schubert, 1959; Ulmer, 1960). While work of this sort continues to be produced, often by the same authors, more recent social science studies of judicial decisions tend to emphasize the interplay between ideology and doctrine (Geyh, 2011; Shapiro, 1981), a process that enables legal scholars to utilize their findings and extend them into jurisprudential areas (Feeley and Rubin, 1999; Kennedy, 1997; Tamanaha, 1997). This work is sometimes described as New Legal Realism (Farber, 2001; Miles and Sunstein, 2008; Nourse and Shaffer, 2009).

A second distinctive strand during the early postwar period emphasized the discontinuity between the law on the books and the law in action. The seminal work in the field argued that contract law, as reflected in the decided cases that were the exclusive focus of most law school courses, did not determine contractual practices; rather, the relationship between the parties and their underlying cultural understandings were the primary determinants (Macaulay, 1963; MacNeil, 1980). Modern sociolegal studies often recharacterize this issue in terms of the implementation process, which involves an analysis of the interplay between statutory or regulatory language and the behavior of the private parties subject to the statutes or regulations in question (Bardach and Kagan, 1982; Coglianese, 1997; Weisberg, 1992). For example, a branch of public, or regulatory, law called New Public Governance questions the effectiveness of command and control regulation, which is based on the idea that law consists of a series of written commands, and recommends

more flexible approach based on this idea that regulation is a dynamic relationship aimed at producing real-world results (Lobel, 2004; Nourse and Shaffer, 2009; Sabel and Simon, 2004). Once again, such an approach yields jurisprudential implications more readily than its predecessor, since it replaces an inevitable abyss between written and practiced law with a dynamic interchange where the practice suggests a reconsideration of the legal structure (Ayres and Braithwaite, 1992; Kagan, 2000).

As these perspectives have become more common, they have been generalized into a mode of legal scholarship described as empirical legal studies. From an institutional perspective, this approach has flourished as leading law schools have hired entry level faculty who have doctoral degrees in social science fields such as sociology, political science, anthropology, and, of course, economics. The result has been a new generation of legal scholars who are trained – and inclined – to obtain and analyze data in an increasingly sophisticated way, often through the use of statistical techniques (George, 2006; Heise, 2002). Substantively, the ideas of New Legal Realism and law in action have combined to produce an extensive scholarly inquiry into the external, or real world, operation of law. In addition to studying the attitudes of judges and the effects of law on private actors, empirical legal scholars investigate patterns of legislation and regulation by administrative agencies, the behavior of public officials, interactions between political events and legal developments, and the effects of social movements on the legal system (Rubin, 2001; Suchman and Mertz, 2010; Trubek, 1984). This expanded scope of inquiry contributes to the continuing attenuation of the distinction between external and internal scholarship. Moreover, as the scope of empirical inquiry expands, and the general approach begins to influence pedagogy as well as scholarship, judges are gradually becoming more interested in and more capable of using empirical studies to obtain information relevant to their decisions, or to shape their decisions with empirical effects in mind. Thus, modern scholarship contributes to a process in which the legal system itself internalizes an external perspective on law, thereby enabling scholars to continue shrinking the distinction between these two perspectives.

Abstract

'Law' and 'legal systems' as concepts are closely related. Since there have been many philosophies and definitions of law, ideas about legal systems have been similarly diverse. A system involves regular interactions among elements that together make up an entity with boundaries. Thus, lawyers, judges, legislators, administrators, the police, and legal scholars all work with particular rules in regularized ways that involve cultural expectations about their roles and the legal institutions and processes with which they interact. This view of a legal system is greater than only the rules themselves. Classification suggests comparison. Comparison here contemplates more than one legal system and the search for similarities and differences among legal systems.

'Law' and 'legal systems' as concepts are closely related. Just as there have been many philosophies and definitions of law, ideas about legal systems have been similarly diverse. A legal system may refer to the rules or institutions of a tribe, city, nation, or international order, or to the natural rules for humankind itself. Moreover, a legal system involves regular interactions among elements that together make up an entity with boundaries. Thus, lawyers, judges, legislators, administrators, the police, and legal scholars all work with particular rules in regularized ways that involve cultural expectations about their roles and the legal institutions and processes with which they interact. This view of a legal system is greater than only the rules themselves, although some people conflate law or even a legal system with legal rules.

Classification of legal systems suggests comparison, inviting the search for similarities and differences among legal systems. Approaches to comparing legal systems or parts of legal systems often involve a broad view for the discipline of comparative law (Clark, 2012). This article is a description of that process of classification and comparison, the varying interest in such matters among civilizations, the approaches that individuals have used, and current theories, purposes, and criticism of legal system classification and comparison.

De-emphasis on Classification in Classical Legal Traditions

Athens

Ancient Greeks made the earliest recorded efforts to explicitly classify legal systems based on their interest in political structure, philosophical speculation, and the comparative study of law. For instance, Plato (429–348 BCE) in the *Laws* discussed the rules of several Greek and other *poleis* (city-states) in formulating his ideal code and legal institutions for Magnesia. He showed how differing constitutional forms yielded either a good state or a bad state. In the *Republic*, he sought to ground law and politics in a model state with a transcendental metaphysics that elite Guardians would implement with an educated vision of the Form of the Good. This approach to achieving justice resonated with subsequent natural law jurists, who would have the basis to compare an actual system of legal rules with a utopian system. Karl Marx (1818–83) used Plato's class-based society in his own theory of law, where each ruling class he analyzed applied law – the product of economic forces – to control society's lower classes.

Aristotle (384–322 BCE) examined many legal structures in his *Politics* before settling on the three preferred categories of kingship, aristocracy, and constitutional government (*politeia*) with their deviant siblings of tyranny, oligarchy, and democracy. He rejected Platonic transcendentalism as well as the Sophists' relativism and skepticism. Aristotle's approach was empirical, rooted in how humans actually govern themselves. He found virtue in the moderation (golden middle) of a legislator, judge, or legal rule. Aristotle's successor, Theophrastus (372–287 BCE), examined comparative commercial law (Bodenheimer, 1974, pp. 6–14, 79–80).

Rome

In Rome, jurists' interest in foreign law was more practical, particularly with the creation of the office of *praetor peregrinus* in 242 BCE. This praetor supervised jurisdiction over disputes involving non-Romans. It was here that the mixture of a less formalistic Roman *ius civile*, Greek law, and other foreign legal norms led to an internationalized *ius gentium*. Roman political authorities allowed distinct ethnic groups in the provinces to rule themselves in most matters, but Roman jurists did not have a philosophical interest in studying and classifying foreign legal systems since they believed in the superiority of their own law. Cicero (106–43 BCE) illustrated this view. An exception that makes the point was the fourth-century *Collatio legum Mosaicarum et Romanarum*, in which excerpts from Roman jurists were paired with the laws of Moses either to improve the stature of Christianity or to demonstrate that Rome had implemented Mosaic law (Clark, 2012).

China

The experience with law in Chinese history is completely different. For most of the past two and a half millennia, Chinese philosophers and political leaders have de-emphasized the use of law in society and therefore found no need to make comparisons with legal rules and institutions in

foreign places. Like the Romans, the Chinese believed in the superiority of their own approach to ordering society and maintaining peace. This separation from foreign legal sources ended in the mid-nineteenth century, when European governments (and the United States) forced Chinese emperors during the Qing Dynasty into unequal treaties granting Western powers and their citizens' special rights, including in Chinese territory.

In place of law, the Chinese in East Asia during the Zhou Dynasty developed the idea that human nature is inherently good, social relations are part of the natural order, and virtuous conduct can be achieved through education and deference to the example of community rulers. Confucius (K'ung fu-tze, 551–479 BCE) refined these ethical tenets to serve also as the basis for government and politics. Subsequent philosophers, such as Dong Zhongshu (179–104 BCE), further elaborated a form of Confucianism emphasizing cosmic harmony.

The ideal person within this ideology is one learned in *li* – rites or norms of proper behavior – who follows the rules modestly and instinctively, thereby repressing his or her own self-interest for the greater good of maintaining harmony. It is obvious that such a community would not need a large legal apparatus with its own set of rules to control human conduct, maintain social order, and facilitate justice. Order and justice are subsumed within harmony. This underlay Chinese ideology until the twentieth century and informs national legal cultures up to the present in those legal systems that China has influenced.

Before Confucianism prevailed as the spiritual and philosophical basis of the Chinese state during the Han Dynasty (206 BCE–220 CE), the political reality of the 'Warring States' Period (481–221 BCE) involved continued armed conflict among rival territorial princes. This reality – so unlike Confucian society – supported the emergence of the Legalist School, with philosophers such as Han Fei Zi (280–233 BCE). Legalists held that humans, in essence, were selfish, looking out for their own interests. When education could not induce proper behavior, the state must punish individuals – both to control them and to set an example for others – with legal rules (*fa*) and processes.

Emperors issued a series of codes that dealt almost completely with administrative and criminal matters. The Tang Code (624 CE) is the earliest that has survived intact. Even when the issue appears to be family or succession law, the rules treat those subjects in an administrative (such as taxation) or penal context. The codes recognize the Confucian notion that legislation is a necessary evil, required only when the social order is seriously disrupted or the state is threatened. The Confucian influence on the penal law appears in the gradation of penalties based on the social status of the criminal and victim as much as the actor's intent or surrounding circumstances. Beyond China, Confucianism has been a major influence on the legal systems of Japan, Korea, Taiwan, and Vietnam.

As far as private law was concerned, the teachings of Confucianism emphasized modes of dispute resolution outside courts. Emperors sent imperial magistrates – men educated in the Confucian literature – to the provinces to carry out administrative and judicial duties and to encourage obedience to Confucian virtue. Disputes should be settled within the smallest unit with authority, whether the family, kin group, village, or commercial guild. Conciliators – with prestige due to age or rank – used the standards of *li* to seek compromise. Community pressure supported that solution. Reconciliation was justice. Only when the conciliators failed would a disputant take the matter to a provincial magistrate, suffering censure for that decision, and experiencing the delay, expense, and corruption of the state courts (Glenn, 2010, pp. 319–360; Menski, 2006, pp. 493–569; Merryman et al., 2010, pp. 553–573).

India and Hindu Law

As in China with Confucianism, Hinduism in India is an ancient system of thought, with religious, philosophical, and social underpinnings, that has served as a guiding force in society to control human conduct. The aim of Hinduism is to provide the individual with a moral compass to guide virtue and piety. Karma from good deeds in this life will permit the transmigration of the soul to a better existence in the next life, perhaps to a higher caste or, ultimately, the soul's release as a higher spiritual being. There is no record of efforts among classical Hindu legal scholars to classify or compare legal systems, but distinct schools of law in India developed in the eleventh and twelfth centuries that might have stimulated such interest.

Hindu law has passed through several periods of reconfiguration from Vedic times (1500 BCE) to the classical phase (500 BCE–1100 CE), the postclassical era, and English influence in India through the East India Company in the seventeenth century. Unlike Islam, scholars do not largely derive Hindu law from ancient religious scripture. Hindus do not need to hold specific religious beliefs. Rather, Hindu law is a kind of common law, continuously developed through customary practices and the historical records of Brahmin scholars until British officials took a greater interest in Hindu law after 1772. Since then, an Anglo-Hindu case law developed together with British statutory intervention in India, which today legal scholars distinguish from premodern Hindu law.

Two points are relevant here. First, Hindu law was less connected to central government activities than the situation with Confucianism in China. India did not have a similar series of imperial codes or imperial magistrates such as those in China. Second, Hindu law was more diverse than Chinese law with a large number of local variations. It also had a richer private law. It emphasized the practice of plurality and relative justice with little interest in uniformity of law. What the two systems shared was a de-emphasis of law in society compared to Western traditions. Hindu law today applies beyond India to Nepal and parts of Africa and Southeast Asia.

The ancient Hindu texts (in Sanskrit) related to law emphasize *dharma*, the obligation of every person to do the right thing at all times – to take the virtuous path. The pluralism of Hindu law lies in the diverse implementation of this principle in the infinite sociocultural circumstances of Indian life, by historical period, region, caste status, gender, age, and so on. The tension with modern Western law is obvious. Hindu law teaches that fixed rules might cause injustice. The endless distinctions treat every individual as separate units, linked all the same by a common conceptual bond in a macrocosmic order (*rita*) or secular truth (*satya*).

Dharma, the appropriate action, must consider all the circumstances with a view to promote the common good. In one sense, the individual is the ultimate agent to determine the 'law' in any particular situation, consequently reducing the role for the state as lawmaker (Glenn, 2010, pp. 288–318; Menski, 2006, pp. 193–278; Zweigert and Kötz, 1998, pp. 313–319).

Islamic Law

Islam, including its law, developed in the Arabian Peninsula in the seventh century CE. It considered Muhammad (570–632) the last in a series of prophets for the monotheistic faith of Abraham, Moses, and Jesus. Islamic law (shari'a) encompasses the system of duties incumbent upon a Muslim by virtue of his or her religious belief. It is the expression of Allah's command for the Muslim community, the revealed word of God (the Qur'an). Spread by conquest and trade, Islam has had a proselytizing appeal, since it recognized no barriers of race or class.

Shari'a is, as is canon law for Roman Catholics or Halachah (Jewish law) for Jews, the law of a religious community. Canon law prior to 1500 had almost universal applicability in Europe, since the Christian church had all the attributes of government (jurisdictions) it shared with secular European rulers. Jurists consider canon law as an early example of 'modern' in the Western sense since it borrowed some of the sophisticated legal norms and lawmaking and interpreting techniques of Roman law. Together with rediscovered and elaborated Roman law, canon law constituted the *jus commune* of Europe. Canon law declined in importance with the rise of statism and nationalism in Europe.

Shari'a today dominates in the Middle East, most of the north half of Africa, Southwest Asia, Malaysia, and Indonesia. It is also influential in other parts of the world; globally, Islam has more than 1 billion believers. Islamic law is a total belief system, since it regulates a person's relationship not only with others and with the state, but also with God. Shari'a is a comprehensive normative system that embraces both private and public conduct. It thus includes ritualistic practices as well as a system of legal rights and duties.

Fundamental to Islamic law is the belief, largely abandoned in Western secular law, that law is an expression of divine will. With the death of Muhammad in 632, communication of the divine will to man ceased. Unlike Western law, which jurists expect to evolve in response to major changes in society, the dominant Muslim jurisprudence states that it should not be society that frames the law, but rather the divine law that molds and controls society. The 'unchanging character of Islamic law' created interesting problems of interpretation for the scholars and operators of Islamic law, and differing views concerning the appropriate solution to such problems account for some of the differences between 'schools' of Islamic law. The major Sunni schools, established by the eleventh century, are Hanafi (Turkey, west Mediterranean, central Asia, Egypt, Afghanistan, Pakistan, India, and Bangladesh), Maliki (north and central Africa), Shafi'i (east Africa, Malaysia, and Indonesia), and Hanbali (the Arabian Peninsula). About 10% of believers are Shi'a, most of whom live in Iran, Iraq, Pakistan, India, Yemen, and Turkey.

These Sunni schools and their difference with Shi'a jurists – the basis for legal system classification – provided the opportunity to develop comparative law, but there is little evidence that this occurred. As with the split of Western Christendom into Roman Catholics and Protestants, the divergence in religious law most often led to hostility and the attempt to exclude or conquer the nonconforming believers. Nevertheless, there were many examples in classical Islam of tolerance for Jews and Christians to live with their own laws.

With the expansion of Western colonization in the nineteenth century, Islamic law declined in importance. In the twenty-first century, however, there is renewed debate in Muslim countries about the place for classical Islam in modern society. Its importance is obvious, and comparatists are not ignoring its relevance for understanding the legal systems of much of Africa and Asia. The utility of humanistic and social science methods is apparent (Glenn, 2010, pp. 181–236; Menski, 2006, pp. 279–379; see Rosen, 1999).

Influence of the Classical Legal Traditions

From the classical modes of thinking about law, its classification, and its place in society, the only one to leave a lasting legacy for modern comparative law was Roman law. Of all the great ancient civilizations, the thousand-year history of Rome as it developed in Western Europe first accommodated foreign law within the republic through the institutional framework of the *praetor peregrinus*. This praetor's annual edict, regulating jurisdiction in disputes between foreigners, and later between citizens and foreigners, together with its juristic interpretation comprised a pragmatic response to the reality of conquest and trade. During the empire, jurists interpreted the legal norms that developed within this institution as *ius gentium*, the law of peoples. Romans thought of this as one version of a universal law in comparison to the other universal, less practical, natural law, or the *ius civile* peculiar to Roman citizens. The Romans borrowed and absorbed some Greek thinking about law, which saw, in addition, a second life during the Renaissance as university law masters rediscovered Aristotle and Plato.

An important difference between Roman law and the other classical laws was that Roman law did not have a strong ideological or religious basis for its existence and authority. Jurists had differentiated it from religion, morality, or philosophy. The important elements of Roman law were pragmatic, with private jurists developing most legal norms in a highly decentralized fashion that they incorporated into classical Roman law, eventually embodied in Emperor Justinian's *Corpus juris civilis* (529–534). This compilation served as the basis for university law study and influence on canon law in Europe after the twelfth century. The law faculties that existed in a large number of European universities, teaching and studying Roman and canon laws, served as the natural place to develop interest in comparative law after the Enlightenment forces of statism and nationalism began to support national law as their alternative in the eighteenth century.

Moreover, while the Chinese, Hindu-Indian, and Islamic legal systems continue in force up to the present, and therefore governments supporting those systems have a strong interest in maintaining their mythic authority, such is not the case for Roman law. In the eighteenth and nineteenth centuries, Roman law often served as the alternative to national law in utilizing comparative law methods. This was as true for Sir William

Blackstone (1723–80) at Oxford in his thesis that English law was as rational as Roman law as it was for John Adams (1735–1826) in arguing against English law as applied in the American colonies. The major exception to this was the new German empire, which embraced Roman law as part of the *usus modernus pandectarum* (Clark, 2012).

Modern Classification and Comparison of Legal Systems

Early Modern Classification by European Jurists

In the early modern era, some natural law jurists such as Hugo Grotius (Hugo de Groot, 1583–1645), Samuel Pufendorf (1632–94), and Baron Charles-Louis de Montesquieu (1689–1755) used comparative law methods to provide empirical backing for natural law principles. Others such as Blackstone had the additional objective of providing prestige for their national law: his four-volume *Commentaries on the Laws of England* (1765–69) emphasized similarities among English common law, Roman law, and natural law.

Montesquieu's extensive speculation about the relation of law to natural and social forces and explicit classification of legal systems emphasized the distinct manners (*moeurs*) of a particular people in a particular era. His *Lettres Persanes* (1721), published anonymously, used the device of two Persians traveling in Europe who satirized the customs of French and European societies. They pointed to the abuses and cruelties of criminal justice systems and argued for a rational theory of punishment adjusted to the settled sensibilities of the people.

Montesquieu's relativist view of humans' ability to achieve justice was further developed in *De l'esprit des lois* (1748), which drew upon causative factors such as climate, soil, population size, people's morals and customs, religion, and commerce. He classified governments along with the appropriate principle for their constitutive societies. Therefore, democracy required civic virtue; aristocracy, moderation against the people; monarchy, honor for the law and intermediate institutions; and despotism, fear to maintain order. He found different mechanisms for lawmaking and adjudication in the first three types of legal systems, but pointed out that law was not necessary for despotism.

Montesquieu had an important impact on others, including Cesare Beccaria (1738–94) and, in the nineteenth century, Alexis de Tocqueville and Émile Durkheim. Beccaria shared Montesquieu's concern with injustice and cruelty in criminal law and procedure in Europe. Beccaria's *Dei delitti e delle pene* (1764), soon translated into English, French, and German, led to restrictions on the use of torture, judge-interpreted crime, and punishment that exceeded a proportionality standard measured by social harm (Clark, 2012).

Nineteenth-Century Classifications

By the nineteenth century, many European jurists and other scholars were developing comparative sociolegal studies. A few of the best known were Léon Duguit (1859–1928), Eugen Ehrlich (1862–1922), Otto von Gierke (1841–1921), Eugenio María de Hostos (1839–1903), Cesare Lombroso (1835–1909), Gustav von Schmoller (1838–1917), William Graham Sumner (1840–1910), Gabriel de Tarde (1843–1904), and Alexis de Tocqueville (1805–59), along with the American Lewis Henry Morgan (1818–81). In Europe, theorists, often at universities, had secured the field of political economy as one that examined the usefulness of political and legal institutions and policies at the level of the state to develop economic production, exchange, distribution, and wealth. Some of those working in this tradition, such as Adam Smith (1723–90), were comparative and explicitly dealt with legal institutions and processes.

Legal anthropology at this time emphasized evolutionary studies, but was also often comparative. European scholars were fascinated with ancient and 'primitive' societies, which by their nature they would have to compare with contemporary European legal systems to provide meaning for the reader. Henry Maine is an obvious illustration, but so too were the studies of Johann Bachofen (1815–87), John McLennan (1827–81), and Lewis Morgan. Although modern anthropologists find most of this research inadequate due to its armchair methods, the emphasis on cultural and historical context remains important. The shift in methodology in the twentieth century to intensive ethnographic research in the subjects' culture and language led to less comparative work, although there have been a few exceptions (Goodale and Mertz, 2007, pp. 68–70).

Further sophistication in comparative law and society came with attempts to classify law and legal systems within two or more categories. Nineteenth-century evolutionary theorists developed elaborate classifications of local and national legal systems. Law in these schemes was part of the larger social system that changed over time. For instance, Sir Henry Maine (1822–88), interested in the striking parallels between the development of English common law and classical Roman law, posited in *Ancient Law* (1861) stages of social development common to different peoples that could be correlated with particular instruments of legal growth. Jurists could characterize legal systems by whether social change occurred primarily by legal fictions, equity or natural law, or conscious creative legislation.

Karl Marx, schooled in Roman law as well as history and philosophy, accepted the reigning concepts of his time about the nature of humans and society. After he added the study of economics, he developed (along with Friedrich Engels, 1820–95) a conception of law that was materialist. Law, in *Zur Kritik der politischen Ökonomie* (1859), assumed a pivotal role in his base–superstructure model of social evolution. In essence, Marx's works supported a theory of law as an instrument of social power, which itself was a reflection of economic relations. In turn, it was people's gradual conquest of nature, a matter of technology, which determined economic relations. Marxist historical materialism comprehends society as structured by the material conditions at any given time. It identified five successive stages in the evolution of these material conditions in Europe, each with a different role for law. These stages were primitive communism, slavery, feudalism, capitalism, and socialism – and perhaps, one day, communism without the state or law.

Émile Durkheim (1858–1917), the first university sociologist recognized as such in France, had wide-ranging interests that included law. In his first book, *De la Division du Travail*

Social (1893), Durkheim described the evolution of societies from mechanical solidarity to organic solidarity. He argued that forms of law provide an index of the type of social solidarity that exists. Repressive law, concerned with punishing offenses, represents mechanical solidarity or the type of social cohesion based on people's shared beliefs and personal ties. A limited degree of religious or cultural diversity could exist in such a society. By comparison, restitutive law, which restores the status quo if social relations are disturbed, represents organic solidarity or cohesion based on functional interdependence. Here, there is substantial division of labor, and comprehensive contract, tort, and commercial law mediates among diverse individual and social interests. In Durkheim's later writing, he emphasized the sacredness of abstract individuals, a religion of humanity to replace the traditional religion found in repressive-law regimes. This was not an egoistic individualism, but a moral individualism that would enhance human dignity and autonomy.

Twentieth-Century Classifications

Anthropologists had frequently observed that some societies operate without government but have social order and law-like institutions. In modern nations, there might be many levels or discrete groups in societies (with their own 'legal' systems), so it became appropriate to speak of legal pluralism. This emphasis on legal pluralism in the twentieth century replaced the earlier prominence of evolutionary analysis. Comparing legal systems then depends on the characteristics of different societies or their subgroups. Leopold Pospíšil, for example, described this situation as a patterned mosaic of subgroups that belong to certain identifiable types with different memberships. Each subgroup owes its existence to a legal system that regulates the behavior of its members. These legal systems then form a hierarchy reflecting the degree of inclusiveness of the corresponding subgroups that one categorizes by legal level, such as the family, lineage, community, region, or nation. People are simultaneously members of several subgroups of different inclusiveness, which may lead to contradictory legal loyalties (1971, pp. 106–126).

Durkheim had written, "Comparative sociology is not a particular branch of sociology; it is sociology itself" (1938, p. 139). This seems self-evident in that the gold standard of the scientific method in the social sciences rests on the comparison of experimentally allocated groups. For sociology of law – even more so for some other social sciences related to law – the challenges of attaining this standard are great. There are statistical ways to simulate scientific comparison using the data that scholars and institutions produce, including from experiments and quasi-experiments, but the task is still difficult.

Max Weber (1864–1920) approached the problem differently. He used many of the same historical sources as legal evolutionists, but in *Wirtschaft und Gesellschaft* (1922) constructed ideal types to facilitate the comparison of actual social and legal systems in trying to explain the rise of industrial capitalism. His four-cell typology for lawmaking and law application considered the rationality or irrationality of legal thought as well as whether legal norms and decision making were highly differentiated from religion, ideology, or emotion. He argued that the category of formal (autonomous) rationality, with a consistent body of general legal norms, provided the predictability facilitating modern capitalism.

Lawrence Friedman in the 1970s argued that scholars could classify legal systems according to their internal legal culture, which includes the attitudes and values of judges, lawyers, and other legal actors toward a task such as lawmaking or adjudication that relies on reasoning or some other basis of legitimacy. He considered two variables. First, when a legal system requires reasoning premised on legal propositions, it is a closed system; when propositions may be nonlegal, the system is open. Second, some systems regard legal propositions as fixed and timeless; others accept change as normal.

Using these two variables, Friedman derived four types of reasoning associated with law. First, closed systems, such as those based on sacred law, formally reject the idea of change. What change does occur must be based on legal fictions. Second, a legal science system such as that in Germany is closed but permits change by simply adding legal rules or deriving new legal principles. Third, traditional or customary law systems do not accept explicit change but are open to new norms based on shifting behavioral patterns. Fourth, a system permitting change by looking outside the stock of legal propositions includes what Weber called substantive rationality. This could be revolutionary legality, such as that in socialist Russia, or welfare legality, which looks to ethical imperatives or utilitarian principles (1977, pp. 76–86).

The comparative politics revolution in the United States during the 1950s shifted law and political science from a field that tended to emphasize public law and describe the legal institutions of foreign governments to one that explained political behavior in structural and functional terms. Gabriel Almond and Bingham Powell, for instance, used the developmental variable of cultural secularization and structural differentiation together with the low or high level of political subsystem autonomy associated with interest groups and political parties to classify political systems. Modern systems could be premobilized, mobilizing, or penetrative and, within each of these categories, either authoritarian or democratic (1978).

By the 1980s and 1990s, an emphasis on empirical and comparative methods to analyze government institutions and processes and the ways in which people relate to them had spread beyond the United States to Europe and elsewhere. Globalization was one of the forces stimulating research on judicial behavior, juries, courts and their processes, criminal justice systems (overlapping criminology), administrative law, dispute transformation and resolution, constitutional courts, and civil and human rights.

Recent Theory and Critique of Legal System Classifications

A useful classification of legal systems should make the criteria of division clear and allow scholars to assimilate, simplify, and comprehend the great wealth of legal minutiae existing in individual systems. The dominant approach to classifying national legal systems in contemporary comparative law is to identify aggregate families, styles, or traditions. Beyond satisfying the aim of simplification, this idea might permit one to

understand more clearly pluralistic legal systems with an official, dominant legal tradition but also including significant religious or ethnic communities lacking a sovereign political organization or indigenous communities with their own law. In the last few decades, recognition of the importance of legal pluralism within national legal systems and consideration of the system's structural and cultural aspects have opened classifications to influence from disciplines related to law.

Legal Families: The Influence of René David

Comparative lawyers have disagreed about the criteria to use for classification, but the results have been surprisingly similar, differing primarily in the number of categories emerging. René David (1906–90) in 1950 used two criteria that were further refined in his 1964 *Les grands systèmes de droit contemporains*, which saw 11 editions through 2003 and translation into English and other languages (David, 1950, 1964; David and Brierley, 1985). David believed that the primary criterion should be the legal system's ideology; its philosophical, political, or economic principles; its social objectives; and the place of law within the social order. A secondary criterion should be a system's legal technique, the law's conceptual structure, and the theory of sources of law. Based on these guides, David found three prominent legal families: Romano-Germanic, common law, and socialist law. Some elements from one or more of these families have influenced all national legal systems. In addition, he identified lesser legal systems, such as those for religious law (Muslim and Hindu) and for East Asia and Sub-Saharan Africa (Pargendler, 2012). David's typology substantially influenced the organization of the *International Encyclopedia of Comparative Law*, a 17-volume undertaking that was the most ambitious of the twentieth century. He edited the second volume, entitled *The Legal Systems of the World: Their Comparison and Unification* (1974).

Legal Traditions

David and Brierley argued that it "is a superficial and indeed false view to see law as being composed of the totality of [legal] rules. … [I]t is linked to a view of the social order itself which determines the way in which the law is applied and shapes the very function of law in that society" (David and Brierley, 1985, p. 19). John Merryman proposed a similar idea for legal traditions, with the same three rated as most influential: civil law, common law, and socialist law. Merryman asserted that a legal tradition is not a set of rules: "Rather it is a set of deeply rooted, historically conditioned attitudes about the nature of law, about the role of law in the society and the polity, about the proper organization and operation of a legal system, and about the way law is or should be made, applied, studied, perfected, and taught. It puts the legal system into cultural perspective" (1969, p. 2). This notion of legal traditions or families still dominates the teaching of comparative law in most of the world.

Legal Styles

Similar to David's revised formulation of legal families and Merryman's legal traditions, Konrad Zweigert (1911–96) wrote about his theory of legal circles, or *Rechtskreisen* (1961). He looked at the styles (*Stile*) of legal systems to divide them into legal spheres or families. He analyzed earlier attempts at classification as too one-dimensional, turning on primarily one criterion. Zweigert, as updated by Hein Kötz (1998), found five factors to be crucial to classify the style of a legal system: (1) historical background and development, (2) predominant mode of legal thought, (3) distinctive legal doctrine or institutions, (4) sources of law, and (5) ideology. Using these factors, Zweigert and Kötz settled on eight categories: Romanistic, Germanic, Nordic, common law, People's Republic of China (replacing the earlier socialist style), Japanese, Islamic, and Hindu.

Critique of Current Classifications

There are several problems with these classification schemes, which their proponents often recognized. First, one intends a classification for a specific purpose, which may make it unsuitable for another purpose. Thus, Zweigert and Kötz intended their divisions to serve as chapters in their comparative law treatise for students and jurists. They omitted an African legal style because they argued it is still in the process of emerging.

In addition, scholars base almost all comparative law classifications on a private law emphasis, which weakens their utility for public law comparisons. For instance, a study of the judicial review of legislation as an aspect of constitutionalism could put England and France in one category but Germany and the United States in another, confounding the civil law–common law dichotomy. Mirjan Damaška rejected the usual classification of legal families in his comparative study of procedure and the administration of justice. He formed a Weberian four-cell model that considered the structure of state authority on one axis (hierarchy or coordinate) and the type of proceeding on the other (conflict solving or policy implementing). Illustrations included the active judge in continental European civil procedure in the conflict-solving hierarchy cell, English and US civil and criminal procedures in the conflict-solving coordinate cell, Soviet civil and criminal procedures in the policy-implementing hierarchy cell, and US public interest litigation in the policy-implementing coordinate cell (1986).

Second, no matter how logical a classification, there will always be hybrid legal systems that do not fit easily within one category or another. Well-known hybrids include, for example, Scotland, Louisiana, Puerto Rico, Québec, Israel, South Africa, Sri Lanka, and the Philippines, which share civil law and common law elements. The People's Republic of China has both East Asian and socialist elements, India has Hindu law for family and inheritance matters but common law for obligations and commercial issues, and Arabian countries have Islamic law for family and inheritance issues but French-influenced law for the commercial sector. Some comparatists assert that all national legal systems are hybrid, thus undercutting the value of classification (Glenn, 2010).

Third, related to the problem of hybrid systems is the situation of legal pluralism, associated with the personality principle for choice of law, in which an official, dominant legal tradition coexists with an indigenous or religious community

that by permission of the state or *de facto* regulates itself according to its own norms. A cultural or anthropological approach is useful for examining this condition (Glenn, 2010).

Fourth, Ugo Mattei suggested a new tripartite classification to reduce the Eurocentrism of earlier approaches. His families depend on the dominant pattern of legal decision making in a system, which he characterized as professional law, political law, or traditional law. In the professional law family (including Western European civil law nations and the common law United Kingdom, Oceania, United States, and Canada), the idea of law predominates, autonomous from politics and religion. The political law family includes ex-socialist and developing countries (Eastern Europe, Sub-Saharan Africa, and Latin America) in which the notion of autonomous law is not strong enough to prevent politics from supplanting legal rules for important legal decisions. Finally, the traditional law family consists of legal systems that may have absorbed substantial elements from the civil law or common law (Asia and North Africa), but in which the dominant culture controlling legal decision making is rooted in Confucianism, Hinduism, or Islam (1997).

Finally, some comparatists have recently engaged the 'legal origins' thesis developed by economists. This approach classifies countries into either the civil law or common law category, and it utilizes empirical data to support two assertions. First, the structure and processes of legal institutions are associated with the origins of the legal system, either civil law or common law. To isolate the salient features of these two traditions (and avoid the unique features of the societies in which they arose), researchers examined those nations subject to European colonization, assuming that the Europeans imposed the transplant with little regard for indigenous factors. Second, the nature of legal institutions will affect economic growth. This is similar to Weber's attempt to explain the rise of industrial capitalism. For some scholars, this framework is descriptive; for others, it is evaluative. The World Bank, for instance, has adopted the latter perspective; it now collects relevant legal data for its series of *Doing Business* national reports. Those in the evaluative camp argue that common law nations perform better overall in economic growth than civil law nations. This outcome proceeds through two channels. For the political channel, judges in the common law are more independent than in the civil law. Thus, the government has less influence on market operations. In the adaptability channel, the case law of common law countries is more flexible and able to adapt to changing social conditions than the legislative texts of the civil law (Michaels, 2009).

Conclusion

Comparative law and society is a challenge to the dominant legal theory prevailing today in most countries among politicians and legal professionals who often ignore cross-cultural legal classifications. The clearest challenge comes from legal anthropologists and others who emphasize legal pluralism as a fundamental reality of social life. Legal pluralism contests the four premises of established theory: nationalism, statism, monism, and positivism.

Nationalism as it relates to law took hold in its modern form in two major waves. The first occurred after the American and French revolutions and dramatically reshaped the legal landscape of Europe and the Americas in the nineteenth century. The second wave happened after World War II in conjunction with the United Nations' mandate for decolonization. Since 1945, under the principle of self-determination, more than 80 former colonies have gained their independence. Some of these new political units were the result of splitting or reformulating former legal structures, and others emerged from consolidation. However, all emphasized what was special about the people within them and different from other people. This singularity, tied to citizenship, could coincide with language, ethnicity, culture (or history), religion, climate, geography, or other features. Nationality demanded symbols to further unity: a flag, a song, a seal, the pledge of temporal allegiance, perhaps a bird, tree, flower, or motto, and possibly a currency or state religion.

Statism suggests that the state should have a monopoly over sovereignty and its implementation through jurisdiction. In traditional Enlightenment terms, this includes jurisdiction to legislate, administer, and adjudicate. Statism supports nationalism and is hostile toward legal pluralism. The latter maintains that individuals may have multiple obligations or loyalties or in essence live outside official state authority. Legal pluralism characterized all legal systems prior to the rise of nationalism. It reflected the more complicated legal universe in which people lived, especially salient during colonialism.

Monism in law is similarly hostile to legal pluralism. Monism holds that there exists the possibility of a single, internally coherent, legal system. Thus, it is supportive of both nationalism and statism so long as the level of concern is the state. However, in the modern nation-state system of independent (and equal) sovereign countries, how can law, binding upon a particular state, exist beyond that state? How can there be international law? The universal monist response, as in France, is that the state will incorporate international legal norms and jurisdiction into its national legal system without exception. Consequently, the state is in reality a subunit of the larger international legal system. The more frequent national monist response, as in the United States (with its supreme Constitution) and even more strikingly in the United Kingdom (with its parliamentary supremacy), is essentially dualist. There exist two distinct legal systems: one national, and the other international. The former will usually incorporate valid international law into its state system as is politically convenient, but in the case of a direct conflict between an international norm and the supreme national law, the latter prevails.

Finally, there is positivism. Positivism in law is the philosophical (or jurisprudential) view that purported norms or institutions that the state does not create or recognize as 'law' are not law. This is the only or dominant theory taught to those who become legal professionals in most of the world. It excludes a meaningful role for natural law, historical jurisprudence, or sociological jurisprudence, even in the face of strong religious influence, ethnic and cultural cohesion, or community institutions and processes such as juries.

The strength of this dominant legal theory and its four elements works against the relevance of comparative law in the

Weltanschauung of most legal professionals. Their legal education is oriented toward national law, perhaps a bit of international law, and little foreign or comparative law. This generalization has less validity today in European countries that are members of the European Union, but even among those nations, some governments make little effort to implement proper education about foreign legal systems. In the rest of the world, nationalism in law is a strong force.

Nevertheless, there have been developments since the 1990s that are encouraging for the understanding of foreign legal systems and the study of comparative law. Economic and cultural globalization is one such obvious development. Small segments of legal professionals in most countries occupy themselves with servicing and dealing with the effects of globalization. A larger group, including judges and government administrators, have occasion to handle foreign and comparative law issues. This involves both transnational transaction work and transnational litigation and arbitration. A few law schools have even promoted themselves as global institutions that are aware and supportive of this international legal integration.

Another encouraging trend is the increased interest among legal scholars and researchers in social science disciplines about legal norms, professionals, institutions, processes, and culture. Most of this work is 'academic,' which in most societies means that it will have little or no impact on the people who do most law jobs. Nonetheless, it offers promise that some small percentage of people will come to appreciate the variety and benefit of legal pluralism. Just as biodiversity is a measure of the health of ecosystems, legal diversity is recognition of the variability and richness of human culture (Clark, 2012).

Legal Systems: Private

Stuart Henry, San Diego State University, San Diego, CA, USA

Abstract

Private legal systems are nonstate means for obtaining compliance with the norms or rules of a social order. They comprise the numerous forms of social control that are part of group or organizational life, but that are not formally part of state law. Private legal systems are ubiquitous; more people are directly governed by them than they are by state law. Private legal systems have been analyzed from the perspective of legal pluralism, but research has challenged this approach as inadequate to explain the interwoven relationship between formal law and private legal systems, suggesting that they each exist in a mutually constitutive relationship.

Private legal systems are nonstate institutional means for obtaining compliance with the norms or rules of a social order. They comprise the numerous forms of social control that are part of group or organizational life, but that are not formally part of state law, even though state law has increasingly come to depend on them. They include, for example, the practices of disciplinary bodies, boards, and councils of nonprofit organizations, nongovernment organizations or private businesses or corporations, the tribunals of professional societies or trade associations and labor unions, and the judicial committees of universities and colleges. They also include the peer sanctioning practiced by members of relatively amorphous voluntary associations, such as self-help and mutual aid groups. They now extend to the self-regulatory practices of virtual or online societies of Internet users (Kokswijk, 2010). They also include the private arbitration industry and the restorative justice movement, particularly in schools and in victim-offender and peer-mediation practices. Finally, private legal systems include private policing and private prisons, which exist in a complementary relationship with public systems of criminal justice, expanding its scope but also developing their own semiautonomy (Simmons, 2007). It is in this last form they can be subcontracted by state systems or can be created or contracted by private corporations to exercise social control on behalf of specific economic interests. At the same time, global legal pluralism requires acknowledgment at least of the semiautonomy of nonstate normative orders in creating law: "Globalization reminds us that the state is constrained not only by other states and supranational organizations but also by non-state organizations (e.g., NGOs), communities (e.g., religious groups), and powerful private players (e.g., multinational corporations). All these actors, in one way or other, play roles in the globalizing world that were traditionally reserved for the state. One of these roles might be the role of lawmaker. This idea is articulated in the theory of global legal pluralism, which posits the existence of a plurality of legal orders created both by states and by nonstate communities" (Michaels, 2005: p. 1211).

Mechanisms of Control

Normative orders are the systems of rules and social and behavioral expectations governing a social group or community. Private legal systems bring about conformity to the normative expectations of their collective settings through one of three mechanisms for administering either positive or negative sanctions: (1) coercion, the threat or use of negative sanctions that reduces a person's social standing, either economically, socially, or psychologically; (2) persuasion or ideological control that uses positive inducements to conformity; and (3) suggestion that reminds people of their obligations, responsibilities, and duties in relation to others.

In some private or nonprofit forms, such as the judicial bodies of universities or professional associations, the administration of justice is elaborate and formalized. It may have considerable history and established precedent, and its sanctions may involve suspension, expulsion, fines, loss of privileges, 'probation' counseling, or suspension of licensure. For example, a university judicial body may judge students who violate a campus's drug or alcohol policy to be in serious violation of their agreed-upon rights and responsibilities, and after conducting an investigation and holding a hearing, it may decide to expel the students from the university, to suspend them from all university programs, or to put them on academic probation and require mandatory attendance at drug and alcohol counseling at the students' own expense. In other cases, such as the community or neighborhood association or the local meeting of Weight Watchers, the private administration of justice may be minimal, implicit, or nonexistent, comprising simply of the exercise of sanctions such as ostracism, shaming, gossip, or ridicule. For discussion of related concepts readers should *see*: Legal Pluralism; Laws, Conflict of.

Significance

Nonstate private legal systems and their administration of justice are important because more people are directly governed by and controlled through them on a daily basis than they are by state law, which remains relatively distant from most people's day-to-day life (e.g., in 2009 approximately 3.1% of the US population were subject to legal sanctions of: incarceration in prison or jail, probation, or parole). However, while state law and its various agencies and operations are publicly accountable, private systems of justice often escape accountability. While numerous refinements and endless energy are invested in public systems of law to protect the

individual's right to due process, to guard against excessive or abusive use of state power, and to minimize arbitrary decisions, rarely are such limitations on potential abuse exercised over the day-to-day working of private legal systems and their forms of justice. Insofar as the ideal of reducing arbitrariness is the hallmark of legality, this is 'a variable achievement,' made more so by the existence of a semiautonomous quasi-legal set of private legal systems (Selznick, 1969). A classic illustration of this is found in the numerous private systems that govern employee dismissal that, although subject to state antidiscrimination laws, need not afford employees due process because the existence of 'at will' employment mitigates against 'just cause' employment termination through due process hearings (Henry, 1994). Likewise, as the Internet and virtual world become arenas of increased social presence, they also become spaces subject to new forms of social control through private legal systems in the form of selfregulation (Kokswijk, 2010). Finally, there has been increasing recognition that instead of law being the exclusive province of the state, "Law is created mainly by non-state communities in the peripheries, not by invoking an authority, but by using the code of legal/illegal" (Michaels, 2005: p. 1213; Teubner, 1997).

Private Legal Systems as Types of Law

Consistent with Weberian sociolegal analysis, private legal systems are types of law insofar as they are guaranteed by the probability that physical or psychological coercion to bring about conformity to the order, or to avenge violation, is applied by a staff of people holding themselves especially ready for that purpose. Yet Philip Selznick (1969) argued that if law is seen only in terms of coercive rules, its moral idealism, its progressive striving to reduce arbitrariness in the administration of justice, is overlooked. For Selznick (1969: p. 7) law is 'generic' in that it is "endemic in all institutions that rely for social control on formal authority and rule making." This means that the norm of legality is not confined to the state but occurs in every group that develops rational rules to administer justice. However, while this approach accommodates the concept of private legal systems, it restricts legality to the formal rational system and discounts the informal, which may still deploy legal authority over those subject to its control.

Georges Gurvitch (1895–1965) was a Russian-born French sociologist who specialized in the sociology of knowledge. His sociology of law built on the works of Max Weber, Eugene Ehrlich, and others to demonstrate that law emanated from social relations and ranged in its degree of organization from highly organized and written in advance to spontaneous and unorganized. He also saw law ranging from formal to informal, and thus he founded a sophisticated analysis of legal pluralism. Building on Gurvitch's (1947) more inclusive analysis, all legal systems, whether rational or irrational, can be considered as existing in two planes. On the horizontal plane is the range of legal systems differentiated by the scale of organizational complexity within which they are constituted and through which they primarily function. This horizontal continuum ranges from the global to the group levels, with a variety of intermediate organizational fields including society, community, and organization. Within any organizational field there are many different types of organization and many types of groups. Moreover, each type of organization may exist in a wider context, but each also has a degree of separation from its encompassing social form, based on its own semiautonomous existence in relation to the whole, of which it is a part. Then, for analytical purposes, consider the degree of formality of the legal system in a vertical plane, as ranging from formal to informal. For Gurvitch, the formal is characterized by being organized, written, fixed, and planned in advance, whereas the informal is unorganized, flexible, spontaneous, and intuitive (see **Table 1**). Clearly it is not necessary for informal systems of private law to be spontaneous, since they can be established over time and build up considerable institutional history. **Table 1** also shows the relationship between different levels of social order ranging from macrolevel (global, societal) through mesolevel (organizational, communal) to microlevel (group) (Ellickson, 1991; Kokswijk, 2010), their related private legal systems embodying primary philosophies of sanctioning and the types of sanctions administered by these various state and private legal systems.

This schema reveals that informal social control is not the exclusive control mechanism of the group. While developed organizational forms, such as the state, appear to be dominated by formal social control (such as criminal law), within law's organization, and reflective of its constitutive groups, there exist numerous levels of informal private justice working within, and sometimes against, the explicit principles of its wider system. Examples would include police discretion and plea bargaining. Conversely, formal social control is not the exclusive mechanism of the state or formal organization. While levels of organizational development often preclude small groups from having highly formal private legal systems, they sometimes develop rudimentary formal controls (Henry, 1983). Thus, each type of collectivity has depths of formal and informal operation. For example, an organization such as a manufacturing company is governed by the regulations of formal state law, but also has its own nonstate private legal system for administering internal discipline. Insofar as this relies on written formal rules, procedures, and penalties, it would be considered a type of formal private law. However, within the same company there may also be a range of groups of employees of different professions, skills or trades, different unions, work teams and social cliques, and so forth. Each may exercise its own private collective control over its members. Arguably the most effective system of control stems from multiple kinds of social control, where each level of operation (from formal to informal) complements the others in bringing about conformity. Indeed, rather than using only one type of legal system, a collectivity typically uses a combination of types and levels of legal systems simultaneously (Henry, 1983).

Models of Justice Operative within Private Legal Systems

In addition to the types of private justice systems and their levels of organization and formality, it has been increasingly

Table 1 Law, private legal systems, and levels of formality

	Global	*Societal*	*Communal*	*Organizational*	*Group*
Type of legal system	International law	Different national state legal systems; different kinds of state law	Private legal systems; norms and controls established by communities	Private legal systems; conflict rules and controls established by organizations	Private group control
Formal control agent (third party control)	International law on human rights; law on genocide. Treaty	State law, US statutory law; US common law, e.g., criminal law	Neighborhood rules and ordinances affecting housing, noise, pollution	Rules on gross misconduct, cheating, employee theft, absenteeism, property damage	Social norms of group governing behavior of its members
Informal control (examples)	Norms governing smuggling	Police discretion; plea bargaining	Neighborhood norms on street crime gay rights racial tolerance	Social norms of indulgence; levels of acceptable violation	Norms of employee work team; norms of street drug gangs
Primary philosophies of sanctioning	Conciliation, Incapacitation	Incapacitation, deterrence, retribution (just desserts), rehabilitation, treatment	General deterrence, reparation, restitution, restoration	Incapacitation, deterrence	Just desserts, incapacitation
Sanction/response	Cooperative enforcement: exclusion, economic sanctions	State enforcement/ sanctions: death, prison, probation, fines	Communal discipline, sanctions: fines, public shaming	Organizational discipline, sanctions: expulsion, demotion, fines	Group self-help (collective aggression, shaming, negotiation)

recognized that systems of justice operate according to different sets of principles, driven by different ideologies, to achieve different justice outcomes. One of the first to address this was Herbert Packer (1968), who distinguished between a crime control model of justice (concerned with protecting the public from victimization by suppressing rule violators) and a due process model of justice (concerned with protecting individual rights). Since Packer, Michael King (1981) introduced an additional four models of criminal justice and Peter Kraska (2004) added several others, which he describes as "criminal justice orientations." In addition to (1) the crime control and (2) the due process models are (3) the medical/social pathology model, in which the administration of justice diagnoses the cause or multiple causes that led to a rule violation, whether individual or social, and prescribe a treatment solution; (4) the bureaucratic/administrative model, which is aimed at preventing rule violation through surveillance, behavior analysis, early detection and the efficient and cost-effective management of risk through the management of offenders; (5) the status passage/constructionist model, which sees justice systems as institutions designed to transform an accused's public identity or social status through impression management using denunciation, public degradation and shaming; and (6) the power-domination model, wherein justice is seen as a myth promoted to provide legitimation for dominant economic and political elite, and to deflect attention from issues of class conflict. Importantly, these same sets of models of justice are manifest as competing interpretations for the operation of different private legal systems.

The Interrelationship between Private Legal Systems and State Law

Although private legal systems, by definition, exist outside the state, they have a semiautonomous relationship with state law (Moore, 1978); they are subject to its broad framework yet within these constraints are free to create and enforce their own rules. That they exercise control consistent with the broad requirements of the state means that they can reaffirm state law, and so function as state surrogates. As such, private legal systems are a subset of the more generic notion of social control, which refers to broad societal, community, or organizational level processes such as socialization, education, social welfare, and so forth that bring about conformity to societal social order. In this broader sense, private legal systems are a reaffirmation of the relations of order, part of the ongoing construction of a collectivity's social reality. In this sense private legal systems merge with ongoing daily interaction as an integral part of the constitution of group process to develop the appearance of stability, predictability, and order. This point is at the heart of Ehrlich's (1913) observation that 'living law' is that which dominates life itself, even though it has not been posited in legal propositions.

Legal pluralism (Pospisil, 1971), founded in Ehrlich's (1913) concept of 'living law,' is the idea that there exist multiple sources of law and that the state need not be the most important source of law. An untold number of laws are created by groups, communities, organizations, societies, and global entities. So the semiautonomy of private legal systems allows them to sometimes assume a contradictory and subversive role in relation to the state. This variety of legal systems may exist in

harmony or conflict, reinforcing or undermining the social control of other private legal systems and even the formal law of the state, such that they may condone and even approve of behaviors that the overarching state system would condemn. For example, consider the toleration of some level of pilfering (theft) by employees in a food manufacturing company or expense overclaims by executives at an energy supplier, both of which are seen as 'perks' of the job.

Any consideration of nonstate private legal systems, therefore, must also involve an examination of the theory of 'legal pluralism' and must address the varying interrelationships between the different types of social control and between their varying levels of formality. Further, insofar as private legal systems exist in an ambivalent relationship to state law, sometimes supporting it, at other times contradicting it (and maybe even undermining it), consideration must also be given to how these forms relate to, and even constitute, the totality of control in a society.

The Limits of Traditional Legal Pluralism

Recognition of the significance of nonstate forms of law has led sociolegal theorists to revise their thinking about the law and society relationship. The suggestion that state law and its institutions for administering justice are but one form of social control has been a core feature of legal pluralism from the foundations of theorizing about law. However, the legal pluralist tradition has focused on the character, source, and hierarchical place of nonstate normative orders in relation to state law. Until the mid-1970s, much of their argument explored the relationship between indigenous tribal custom and European colonial law (Pospisil, 1971). This tradition saw indigenous orders as autonomous, independent, yet subordinate to colonial law. By the mid-1980s, the emphasis had shifted to noncolonial societies but retained its concern with the hierarchical power relations between dominant and subordinate law forms. Thus, many critical theorists take 'informal justice institutions' as the subordinate normative order and examine how they serve the ideological function of blurring the power of the state so that it appears to be a benign part of the social fabric. They have shown that this ideological subordination is accomplished by the co-optation and exploitation of a human desire for informal, localized, community justice, and that the episodic tendency toward an 'informal,' decentralized state control serves a dual legitimating and net-widening control function for the state (Cohen, 1985). However, these criticisms seem more applicable to the growth of state-sponsored dispute settlement institutions, community policing, and restorative justice (Simmons, 2007) than to explaining the state's interrelationship with other, established, private legal systems, which have largely been ignored. During the late-1980s, attention turned to the contribution that the social relations of these nonstate systems of law make to the constitution of state law.

Private Legal Systems and Constitutive Legal Theory

Critical contributions to the legal pluralist debate argued that recognition of the interpenetrating role of nonstate normative orders requires a new conception of law in society. This has been variously referred to as the 'relational theory of law,' 'constitutive theory,' 'postmodernist' or 'deconstructionist' theory, and 'discursive theory' of law.

Constitutive theory (Moore, 1978; Fitzpatrick, 1984; Henry and Milovanovic, 1996) explores how law or legal relations are generated within nonlegal social relations, and how legal relations and social relations are interrelated. Thus, instead of assuming that state law is the hub of social control whose spokes radiate as unidirectional pathways of influence to other social and normative orders, constitutive theory examines forms and mechanisms whereby legal relations are penetrated by extralegal social relations. A constitutive approach examines both the presence and the source of other social forms (see Hunt, 1993).

It is not, then, just that law is created by classes or interest groups, whether instrumentally or symbolically, to maintain or increase their power. Rather, some of the relations of these groups, particularly their rules and procedures are, and indeed become, the relations of law, as relations of law similarly become social relations. Thus "what constitutes 'the law' in any specific context will depend upon which legal networks … intersect in that context, how these orders are mobilized, and how they interact" (O'Malley, 1991: p. 172).

Peter Fitzpatrick (1984, 1992) explored the notion of interrelationships between law and the larger social matrix within which it is set, developing the concept of 'integral plurality.' He argues that the reason state law is, in part, shaped by the plurality of other social forms, while these forms are simultaneously being shaped by it, is because 'elements of law are elements of other forms and vice versa' (Fitzpatrick, 1984). Fitzpatrick (1988, 1992) also highlights that the interrelations between state law and nonstate normative orders form new entities, as a common discourse and set of practices is worked out between participating arenas of power. He says that in the synopsis of existing rules and practices, the participating networks retain their own relative autonomy, but corresponding structures are formed that merge selected elements of the component networks into an emergent whole that becomes the new law. Pat O'Malley describes these attempts at legal synthesis as 'synoptic projects' (O'Malley, 1991: pp. 172–173), which are most likely to occur where changing conditions, such as the emergence of obstacles to the continued effectiveness of existing arrangements, make their continued operation problematic. A similar misreading occurs, says Teubner (1992, 1997), when the organization reincorporates legal rules developed and refined in disciplinary proceedings and makes use of them to restructure its organizational decision making (*see* Law and Everyday Life; Legal Culture and Legal Consciousness).

Although much has been written about how law shapes social forms and about how interests shape law, until the mid-1980s little research had been done on the way that semi-autonomous nonstate private legal systems interrelate with and constitute state law while also being constituted by it. Neglected is the extent to which their agency contributions, as carriers for the private normative systems, transform that law in the process of constituting and reflecting it. A critical research question becomes how private legal systems, such as professional self-regulatory bodies, workplace disciplinary practices, and the variety of other nonstate forms of social control, are constitutive of state law.

In considering the theoretical significance of constitutive legal theory to understanding the relationship between law and private legal systems that govern normative orders, it is worth stating the obvious. Law, and particularly statutory law, is often a deliberate effort to incorporate and synthesize custom and practice, norms, and rules prevailing in other settings into a general legal framework. Legal scholars project that this will likely continue: "By their very nature, states likely will continue what they do now: incorporate, defer to, or delegate normative orders, but not accept them as law. This may seem narrow-minded or blind. Yet this blindness is the consequence of the blind spot in the conception of the state" (Michaels, 2005: p. 1249). Michaels argues that the self-identity of the state is such that it has to transcend the normative authority of these private legal systems in order to maintain its own authority and superiority. The point, however, is that by recognizing the relative autonomy of these nonstate systems of private law, and simultaneously recognizing their ability to interrelate with state law, constitutive theory allows for the possibility that law creation will have an unpredictable outcome. In this process the eventual product is always different from what its drafters intended. This is so, precisely because of the relative autonomy of nonstate private legal systems.

Scholarly writings between 1980 and 2000 often took a somewhat romantic view of the role of nonstate law, one that overstated these orders' semiautonomy. Sharafi (2008) points out that during this period nonstate law came to be seen as a form of 'popular justice' or 'people's law' that was present in all societies, not just colonial or postcolonial ones, where it was first studied. However, recent scholarship has shifted toward reengaging the colonial perspective through a legal pluralism that recognizes cultural diversity as importing elements of minority or other cultures' normative systems into the Western legal model through such mechanisms as 'the cultural defense.' This perspective acknowledges that different cultural values and traditions govern normative behavior and should reduce the consequences for law violation in state courts. Others, notably feminist legal scholars, have criticized the cultural defense version of legal pluralism, arguing that it decriminalizes violence against minority women in the name of acknowledging the validity of nonstate law.

Legal Traditions of Southeast Asia

Abstract

Just as pluralism is the mark of Southeast Asia societies, legal pluralism defines much of Southeast Asia's laws and legal traditions. Indigenous legal traditions were based on customs and religion, and government conformed to ideas of monarchy. Colonialism brought in European law, which still forms the framework of law in the region, but it conflicted with local legal cultures and traditions. Nationalism brought in authoritarian laws rather than a reversion to indigenous legal traditions. Development has, however, led to some convergence of public and private laws.

This article endeavors to describe the legal traditions of Southeast Asia. There are obvious difficulties in identifying the meaning of 'legal tradition' and even of 'Southeast Asia,' as well as in justifying their conjunction in this article. Generalizations of any kind about law in such a diverse region as Southeast Asia, which is one of most diverse regions of the world, are in fact hard to come by, unless legal pluralism itself (evident in many parts of the world and even arguably in all legal systems) may count as a defining set of norms. M.B. Hooker's groundbreaking work on legal pluralism significantly takes Southeast Asia as its field of inquiry (Hooker, 1975). The same author's monumental two-volume *Laws of South East Asia* (Hooker, 1986, 1988; also Hooker, 1978) is similarly imbued with legal pluralism and provides the scholarly bedrock for this subject. The concept of legal pluralism in the sense of formal or official legal pluralism (see below) defines Southeast Asian legal systems, not in the sense of being a theory consistently adopted across the region as a matter of public policy or legal theory, but in the sense of being the medium in which law necessarily operates at all levels given the diversity of the societies in question.

Southeast Asia

The term 'Southeast Asia' itself was invented by the British navy as a means of dividing command during World War II. There was, and still is, little to define the region in terms of law, and even in terms of nonlegal factors, such as ethnicity, religion, political system, or trajectory of economic development (Cambridge History of Southeast Asia, 1992). Nowadays one can at least point to a binding fact of geopolitics, namely the existence since 1967 of the Association of South East Asian Nations (ASEAN), which from the late 1990s has included the 10 southern Asian continental states that do not fall under 'South Asia' or 'Greater China.' This list includes Cambodia, Laos, Myanmar, Vietnam, Indonesia, Malaysia, Philippines, Singapore, Thailand, and Brunei. (Some might also include Timor Leste, which obtained independence from Indonesia in 2002, and which is likely to join ASEAN.) These countries perceive that they share economic and strategic interests, and together they represent nearly one twelfth of the world's population. The existence of ASEAN has not thus far created any discernible tendency for the region's legal systems to converge (ASEAN Law Association, 1995), although the increase in intraregional trade resulting from ASEAN cooperation creates the possibility of some harmonization, at least in the field of economic law; and the creation of a human rights mechanism following the adoption of the ASEAN Charter in 2008 (Durbach et al., 2009; Tan Hsien-li, 2011) may ultimately produce some commonality in approaches in that area too.

Given that ASEAN is a creation of the last half century we struggle to find commonalities in remoter history. Empires and kingdoms came and went – the Sri Vijaya Empire in the eighth to twelfth centuries; the Khmer Empire in the ninth to fifteenth centuries; the Majapahit empire in the thirteenth to fourteenth centuries; the Malacca Empire in the fifteenth century. Individual kingdoms waxed and waned in power – Vietnam, Siam, and Burma, for example – but no single power has ever held sway over all or even most of Southeast Asia or left a distinctive cultural or legal mark on the region (Hall, 1981). Even during the years of colonial rule the region was divided between Britain, France, the Netherlands, Spain, and Portugal, with Siam (called Thailand from 1939) remaining independent. The experience of colonialism was common to the region but its effects tended to divide rather than unite it. This is especially true in the field of legal traditions (Hooker, 1988).

Legal Pluralism and Legal Traditions

Southeast Asia is not therefore a region that associates itself naturally with any particular legal tradition or traditions, unlike, say, the Islamic world or continental Europe. Indeed, apart from the customary laws of the region's many indigenous peoples, all of Southeast Asia's legal traditions are imported ones, having their origins outside the region; there are in fact very few of the world's legal traditions that are not represented in some way in Southeast Asia. It is a region in which there will be found a bewildering plurality of legal traditions in confusing relationships with each other and with state law. Thus within the geographical area described by each of these states lie complex webs of plural ordering around ethnicity and religion (Harding, 2001).

We are forced to confront squarely here the term 'legal tradition.' In Southeast Asia legal traditions in practice exist within or outside the formal legal system. To a large extent the

region's states practice formal legal pluralism in that the state recognizes forms of law other than the law created by the state itself or continued in effect by the state, for example, when the colonial period came to an end (Hooker, 1975). This might seem to be a contradiction in terms, but for the fact that these other forms of legal ordering predate modern formal state law and have been incorporated or corralled within it – not always, but surprisingly often. Beyond this it is a problem for both 'legal tradition' and 'legal pluralism' that there are many forms of legal ordering that exist independently of formal state law, and there is no obvious criterion whereby one would include or exclude them from consideration as 'Southeast Asian legal traditions.' This in turns raises the perennial problem of how to define law itself. A state-centered definition would draw a line at formal legal pluralism; it is often argued, however, that in Southeast Asia, despite its extensive formal legal pluralism, this is arbitrary and misleading (von Benda-Beckmann, 2002). A community-centered definition of law would include customs and practices even where these are not endorsed by formal state law (Griffiths, 1986); here it may be argued that 'law' loses any clear meaning, shading into potentially any form of social ordering or social practice (Tamanaha, 1993). The term 'legal tradition' itself suggests a body of knowledge handed down between generations rather than simply found in a library or some authoritative governmental source; this does not imply a notion of simply how people behave, but a notion of behavior according to some received normative framework. While an expansive view of 'legal tradition' will be attractive to Southeast Asia experts, it creates the enormous empirical difficulty of verifying which legal traditions may be included. For present and purely pragmatic purposes we will take state law to represent 'law,' even though the official recognition or nonrecognition of some legal traditions in Southeast Asia is in many respects quite arbitrary or controversial (see Legal Pluralism for further discussion of the ambiguity of this term). In adopting this pragmatic definition we have to recognize nevertheless that there is an important other side to law that it would be foolhardy to ignore if one wished either to understand, to apply or to reform state law in Southeast Asian countries; or indeed to take the variety of *unofficial* customary law seriously.

Precolonial Law

Before the intervention of colonial powers from the fall of Malacca to the Portuguese in 1514, law in Southeast Asia was based either on customs, on religion, or on codes, and often on all three. Buddhist legal traditions prevailed in continental Southeast Asia (Huxley, 1996), and were used along with royal decrees and village customary dispute settlement systems. Hinduism had influence across much of archipelagic Southeast Asia, replacing Buddhism to some extent in Indonesia, and even to this day in Bali. Islam began to be influential from the early fifteenth century, especially in the Malay world of peninsular Malaya, Indonesia, and Mindanao in the southern Philippines. Muslim communities are, however, spread across all of Southeast Asia, and Islamic legal traditions are formally recognized not just in Malaysia and Indonesia, but also in Myanmar, Philippines, Singapore, and Thailand (Hooker, 1986).

Malay customary law or *adat* is by far the most typical, distinctive, and widespread form of customary law in Southeast Asia. It mingled with Islamic law in what Hooker calls the Malay legal world of Indonesia and Malaysia, and has survived both colonial rule and postcolonial nationalist modernization. *Adat* varied somewhat from place to place, but conforms to conventional notions of customary law: it was handed down as an oral tradition; often took the form of easily recalled proverbs, homilies, or brief lines of poetry, often containing analogies to the natural world; and applied generally at the village level. It dealt not just with social and moral issues (family and criminal law in modern parlance) but also with property, agriculture, the environment, and even constitutional issues. Its typical mode of enforcement was via criminal or social sanctions (Hooker, 1970). The famous Dutch legal scholar Cornelis Van Vollenhoven argued strongly and successfully in favor of allowing the Indonesians to be governed by their own *adat* instead of Dutch law (Fasseur, 1992). He founded the *adatrecht* school at Leiden University, in which Dutch and Indonesian scholars mapped out 19 regional varieties of *adat* in the Dutch East Indies (Holleman, 1981; Burns, 2004). A fundamental distinction within these varieties was that between *adat temenggong* and *adat perpatih*; the latter, applicable mainly in the Minangkabau areas of West Sumatra (Indonesia) and Negri Sembilan (Malaya) excited much interest with its matrilineal system of succession to property and its female-centered laws. Nowadays *adat* still prevails as an aspect of law applicable in the religious courts of Malaysia, Indonesia, and the Philippines, and as the main form of law applicable to the 'native' or indigenous peoples of Borneo. The Malaysian state of Sarawak, for example, applies an almost complete system of formal legal pluralism by applying *adat* in the Native Courts, *shari'a* in the Syariah Courts, and common law in the civil courts, which also apply the customary law of nonnative groups, such as the Chinese (Hooker, 1980).

It would, however, be erroneous to think that codes and statutes played no part in precolonial law. There are many examples in Southeast Asia of attempts to codify the law. These should be distinguished from codes in the European sense of attempts to reform as well as to consolidate the law in a given area. Traditional law in Southeast Asia did not distinguish fields of law in same way that European law consistently did: notably they did not distinguish criminal, public, family, and property law. Attempts at codification were designed to consolidate the entire law or at least large portions of it. Preeminent examples are the *Undang–Undang Melaka* and the *Undang–Undang Laut Melaka* (Laws of Malacca, fifteenth century) (Liaw, 1976); Siam's 1805 Law of the Three Seals (Harding, 2008); and the codes of the Le dynasty in Vietnam (fifteenth to eighteenth centuries). The Law of the Three Seals is of particular interest in terms of codification. A response to the perceived decline in legal veracity resulting from the destruction of Siam's legal records in the sack of Ayutthaya by the Burmese in 1767, it attempted to restate the entire law of Siam in terms of the Buddhist Dhammasat along with royal decrees of general application. It was not initially published, indicating its function as a reliable guide for officials and judges rather

than a statement of the rights of Siamese subjects (Hooker, 1986; Vickery, 1996).

Colonial Law

The advent of European colonialism from the early sixteenth century onward, and especially in the nineteenth century, resulted in the gradual imposition of European laws as the general law in all of Southeast Asia. In some cases such as Burma, Tonkin (Vietnam), Philippines, and Cambodia, the colonial power actually overthrew or displaced the traditional monarchies and the legal traditions that were attached to them. Even so, these legal traditions were retained to the extent that they represented exceptions to the general law, especially for personal law purposes. The case of Burma was particularly unfortunate, as Burma had in many ways the most advanced legal system in Southeast Asia prior to 1885 (Huxley, 2001) when the monarchy was overthrown by the British in the Third Anglo–Burmese War. Elsewhere, such as in British Malaya, parts of the Dutch East Indies, and the French Vietnamese protectorate of Annam where the Nguyen dynasty reigned until 1945, traditional rulers were retained in a system of indirect rule, and European laws were only introduced piecemeal (Ta Van Tai, 2004–2005). As the European powers moved from establishing trading posts to exerting political control over hinterlands during the mid- to late-nineteenth century, they increasingly imposed their own laws. There were, however, variations in terms of the geographical spread of these laws, the people to whom they applied, and the legal subjects they covered. In general personal laws, being based on the fundamental social values or religions of the Asian peoples under colonial subjection, remained untouched, although legal structures under colonial control (courts, judges, legislation) were put in place to administer them. This of course tended to alter the effect and the dynamism of the local legal traditions. Property and commercial law, being essential to the economic purposes of colonial governments, and criminal laws, designed to maintain social order and the power of the colonial government, generally and increasingly conformed to the law of the colonial power. Migrant peoples, such as the Chinese and those of South Asian heritage, were generally allowed to have their own law, at least initially; eventually even these were gradually absorbed under the aegis of the colonial law (Lev, 2001a).

An interestingly contrasted approach is revealed as between British and Dutch legal policy regarding legal pluralism. The British introduced English law as the general law in the Straits Settlements of Penang, Malacca, and Singapore (Phang, 1990), but they did not enforce it in a monolithic way. Instead, they modified it in its application to the subject peoples, sometimes even recognizing full exceptions (such as Islamic personal law for Muslims), on the ground that to do otherwise would be oppressive, as well as courting rebellion. The Dutch in the Dutch East Indies, on the other hand, adopted a policy of recognizing 'law populations'; under this theory each people having its own law would be dealt with according to that law (Lukito, 2013). Over time, the tendency of the English common law and pragmatic legislative measures to make exceptions, and the tendency of the Dutch system to reduce the exceptions by common legislation, narrowed the difference, in practical application at least, between these starkly different theories. Only in relation to the Dutch East Indies was there an intense debate as to the correct ethical position for a colonial power (Fasseur, 1992). In the British-held territories the Indian precedent was followed; in other words, in due course the codified common law of British India was adopted (the Penal Code, the Criminal and Civil Procedure Codes, the Contracts Act, the Evidence Act, and so forth) (Tan Poh-ling, 1997).

Thus by the late nineteenth or early twentieth century European laws became the rule rather than the exception, governing most areas of law, or at least framing their administration. The Dutch maintained a system of religious courts (Lev, 1972), while the British had, by treaties, reserved to the Rulers of the Malay states jurisdiction over matters affecting Islam and *adat*. As a result of these colonial legal developments, without exception the Southeast Asian states even now base their legal system on a European framework (Harding, 2001) conforming to a variety of the civil law or else of the English common law: French law in Vietnam, Cambodia and Laos; Dutch law in Indonesia; Spanish law in the Philippines; Portuguese law in Timor Leste; the English common law in Singapore, Malaysia, Brunei, and Myanmar. The Philippines, having been under American rule for the first half of the twentieth century, has a hybrid system, with some areas (such as commercial and constitutional law) resembling the law of the United States. Malaysia, Indonesia, and Brunei maintain a bifurcated legal system as between the ordinary courts applying the common law, and the religious courts applying the *shari'a* law to Muslims in personal law matters. In Singapore the Syariah Court remains a subordinate court within the main legal architecture. In Malaysia a constitutional amendment in 1988 separated the Syariah Courts from the 'civil' or ordinary courts by providing that the latter could not exercise the jurisdiction of the former (Federal Constitution, Article 121(1A): Harding, 2012; Moustafa, 2013).

An exception here in several respects is Siam, which, although never colonized, came under colonial influence if only by virtue of being under the whip of extraterritoriality treaties concluded with Western powers and Japan in the latter half of the nineteenth century (Hooker, 1986), and the witnessing of neighboring Burma's fate. These treaties provided for citizens of the country in question to be treated under their own law while on Siamese territory, and expressly linked the rescinding of this arrangement to the enactment of 'modern codes of law' in Siam. King Chulalongkorn the Great (1868–1910) and his immediate successors achieved a transformation of Siamese law as complete as that imposed by any colonial power elsewhere in Asia. Over a half century from about 1885 to 1935, Siam adopted codes based eclectically on civilian systems with some influence from the previous law based on the Buddhist *dhammasat* and the common law. By the time the Civil and Commercial Code was completed in 1935, the extraterritoriality treaties had as a result been entirely revoked. Siam's model here was to follow Japan's voluntary espousal of the civil law rather than India or Vietnam's enslavement to a single foreign legal system. Unlike Japan, Siam was mainly influenced by French and Belgian, rather than German, jurists, having earlier flirted with the adoption of the common law, which proved too

problematic in its practical application to be an appropriate model. Following this complete transformation of Siam's legal codes, the Law of the Three Seals was consigned to legal history (Harding, 2008).

Postcolonial Law in the Period of Nationalism

The struggle against colonialism took different forms and affected the vectors of national legal systems across Southeast Asia. In the common law countries (Burma, Malaya, Singapore, Brunei), as well as in the Philippines, following India's independence in 1947, independence was gained without much difficulty, and the common law was assumed to represent an inevitable form of legal continuity. In Indonesia and Indo-China, however, independence from the Netherlands and France, respectively, was attained only after fierce, and in Vietnam's case, prolonged, warfare. The continuation of colonial laws in these latter countries represented a temporary expedient rather than a solution. Vietnam, initially divided (1954–76) between the capitalist South and the communist North, was torn apart by a devastating proxy war, the North becoming ultimately victorious by 1975 and bringing all of Vietnam, and Laos too, under socialist law based on that of the Soviet Union (Gillespie and Nicholson, 2005). Cambodia under the Khmer Rouge (1975–79) saw its laws and legal professions, indeed even legality as such, tragically and completely obliterated by genocide, and the road back from the ground zero of 1979 (legally and in general) has been extremely difficult.

Under the influence of the legal scholar Supomo, Indonesia adopted a constitution in 1945 (that is still in force) that embodied an integralist view of the state that was hostile to individual rights and the rule of law; it also rejected as highly divisive the notion that the state should be based on Islam (Lev, 2001b). Nationalism did not, however, succeed in bringing Indonesians under anything resembling the revolutionary law (*hukum revolusi*) desired by President Sukarno (1945–66). Rather it secured the temporary eclipse (1963–66) of the Dutch civil code, which during the New Order (*Orde Baru*) period of President Suharto (1966–98) ultimately survived only to be hollowed out by successive new laws on, for example, land and marriage (Agrarian Law, 1960; Marriage Law, 1974) (Lev, 2001c). Personal laws are divided as between those for Muslims, based on Islamic law and *adat*, and those for non-Muslims. The 1998 economic crisis, which affected all of Southeast Asia, brought an end to the authoritarianism of Suharto's New Order and the commencement of a new period of reform (*reformasi*), marked by extensive legal reforms and constitutional development led by four major amendments (1999–2002) to the 1945 Constitution that altered its character profoundly (Butt and Lindsey, 2012). The *reformasi* period has transformed Indonesian law once again as democracy replaced authoritarian government, and the rule of law (*negara hukum*) replaced nationalist laws such as the Judiciary Law 1970, which brought the judiciary under government control (Lev, 2001b).

A slightly similar pattern may be seen in the Philippines, where postwar independence ultimately led to the dictatorship of President Ferdinand Marcos and rule by emergency decree under an increasingly manipulated constitution during 1972–86. The ousting of Marcos by 'people power' in 1986 led to a new constitution in 1987, securing a vibrant if sometimes violent and unstable democracy. Some elements of Philippines law, such as the absence of divorce law and antiabortion law, can be traced to its largely Catholic population. The old Spanish Civil Code is still in force, but the American common law is influential in some areas, notably constitutional and commercial law (Santos, 2000).

An extreme case of this now-familiar legal trajectory is Burma, which became independent in 1947. As was the case with other Southeast Asian states, Burma did not attempt to reintroduce the traditional legal system, just as it did not reintroduce the monarchy. Indeed its laws were simply in effect the codified laws of British India, of which it had been a major province between 1886 and 1937. In 1962 the coup of General Ne Win resulted in a gradual demolition of the system left by the British and the 1948 Constitution. Judicial independence and the doctrine of precedent were done away with in favor of government policy as a prevailing norm under the 'Burmese path to socialism' (Myint Zan, 2000). Legislation was introduced as Revolutionary Council decrees. The Anglo-Indian codes remained but were not always used in practice. In 2011, after half a century of military rule, Myanmar (as it has been called since 1989) began to open to the outside and reform its legal system, posing anew the issue of how to reestablish legality and constitutionalism in a country plagued by interethnic wars and intercommunal strife. The persistence and progress of these reforms remain in doubt, as does the nature of Burmese legal traditions (Crouch and Lindsey, 2014)

Asian Laws, Asian Values

Underlying many of these developments lies the issue of the fundamental nature of law in Southeast Asia. To what extent is it or can it be indigenous, or conform to patterns markedly different from those of its former colonial powers? To what extent also does it or can it embrace international norms of the rule of law, constitutionalism, human rights, and property? Is it in fact resistant to the foreign legal transplants to which it has been repeatedly subjected?

The diversity of the region makes it difficult even to explore general answers to these questions. As we have seen, the region has not used the independence of the postwar era to return to its legal roots in precolonial law. Rather it has attempted to build national legal traditions on a base of colonial law – we have seen in Indonesia's case how contradictory this can be. Whatever the merits or otherwise of traditional law, no sustained argument has succeeded in restoring even some limited elements of precolonial law. Indeed in many areas, even in personal law, the law has moved further away from precolonial law and from legal pluralism, for example, with the establishment of monogamy, consent, female equality, and divorce grounds in marriage law. *Adat*, it is true, has staged something of a comeback in Indonesia, and Islamic revival has prompted a demand across parts of the region for the correction of

the displacement of Islamic law by the colonial powers. In neither Malaysia nor Indonesia, however, has Islamic law been embraced as the general law, nor has the state taken on a genuinely and expressly Islamic character. In Vietnam socialist law has been somewhat eclipsed by the recognition of private property and liberalization in many areas of law (Sidel, 2010; Gillespie and Nicholson, 2005).

During the 1990s attention was given to the notion of 'Asian values' with specific reference to the autonomy of Asian states to develop their own laws without necessarily conforming to Western laws or international norms (Bell, 2000). Part of the argument about Asian values was that Asian societies embraced a form of communalism or family values that was seen as hostile to what was perceived as extreme Western liberalism and individualism that tended to dissolve social bonds. This argument was mainly advanced by political leaders in Singapore, Malaysia, and Indonesia, but had resonances in other Southeast Asian countries. This development was a direct response to advances in international human rights, and as expressed in the Bangkok Declaration on Human Rights 1993 (Thio, 1999). The Asian values argument did not reject human rights as such (indeed all Southeast constitutions acknowledge human rights in some form), and several Southeast Asian states (Indonesia, Malaysia, Myanmar, Philippines, and Thailand) even have a national human rights institution (e.g., Whiting, 2003). However, proponents of the Asian values argument refused to accept that all human rights as defined by Western powers in the evolving international system were totally applicable in Asian societies; or that human rights were indivisible or to be interpreted according to Western normative values. The main problem with this thesis is that, given the diversity of Asian value systems, it has proved in practice difficult to find common ground between these various traditions or between different types of legal consciousness. It also appeared that the argument was advanced in a self-serving manner by Asian leaders anxious to buttress their power by appeal to a common authoritarian ideology, which sits uncomfortably with advancing democratization. Nonetheless, one can observe that, while in practice Southeast Asian states do on the whole assert their autonomy with regard to human rights (for example, with regard to laws on national security), it is also true that human rights are being increasingly recognized either in constitutional law and in actual practice (for example, with regard to religious freedom, ethnic minorities, gender, and gay rights).

The Future of Law in the Region

From this brief account of Southeast Asia's legal traditions we can see that "it is appropriate to think of law in South East Asia geologically, as a series of layers each of which overlays the previous layers without actually replacing them, so that in places, due to tectonic shifts, the lower layers are still visible, although not perfectly distinguishable from each other" (Harding, 2001: p. 205). The issue for Southeast Asians is whether this accommodation of legal pluralism is a fundamental problem for the unification of legal traditions under one system based on the rule of law and legal equality, or whether it is a pragmatic or even principled balancing of legal traditions under a system that recognizes the differences between them. The surprising fact is that the legal systems of the region have in practice achieved the degree of syncretism that they have. Legal pluralism continues to present difficulties (for example, citizenship and customary law in Thailand, mixed marriages in Indonesia, and single-parent conversion of children in Malaysia). However, the larger issue is rather the credibility and performance of legal institutions per se: the independence of the judiciary; the rule of law in one-party or dominant-party states; the observance of human rights and civil liberties; corruption in the judiciary, the police, the bureaucracy, and the electoral system. Across Southeast Asia in the early twenty-first century it is therefore increasingly through *constitutional* debates that the nature of law and the relevance of legal traditions are being addressed. While it appeared, in the midst of the Asian values debate, that Southeast Asian states were perhaps largely settling into semiauthoritarian systems accommodating legal pluralism, events since then have suggested otherwise. The rapid growth of civil society; people power in the Philippines from 1986; *reformasi* in Indonesia from 1998; the emergence of a two-party system and legal reforms in Malaysia from 2008; the establishment of constitutional government in Cambodia in 1993; constitutional reforms in Thailand from 1992; the progressive espousal of the rule of law as official doctrine in Vietnam since 1987; the opening of Myanmar since 2010; the creation of an ASEAN human rights mechanism in 2011 – all of these are taking the region toward a different but uncertain future. What does seem clear is that debates as to the relevance of legal traditions are now concerned not so much with the accommodation of legal pluralism and the applicability of colonial law in an era of nationalism, but rather with the nature of citizenship and diffusion of justice in rapidly but unevenly developing economies and urbanizing societies.

Legalization: The Expansion of Law's Domain

Jethro K Lieberman, New York Law School, New York, NY, USA

Abstract

As human societies have become more complex, they have seen increasing legalization – understood here as the tendency of placing problems under the control of the legal system. Legalization has become a dominant factor in industrially developed nations since the nineteenth century, as law has spread in an effort to control complex relations that have emerged with developments in technology, communications, travel, and the commercial market. Among its consequences are increases in rates of litigation and the development of law-based institutions, even in the international arena, to control harmful conduct by individuals, organizations, and the state.

Legalization is a Janus-faced concept that betokens both freedom to act and subjection to law. In the first sense, it means being freed by law to act in ways formerly forbidden – for example, the repeal of Prohibition by the US Constitution's Twenty-first Amendment that legalized drinking, or the 'decriminalization' of so-called victimless crimes such as prostitution and drug use in some nations. Legalization in this sense is also exemplified in legislative acts that free worshipers from the straits of official religion. In the second sense (for which other terms have been suggested, e.g., 'juridification' (Silverstein, 2009: pp. 1–11)), legalization signifies transferring control of an action or behavior to the legal system. Acts of legalization may certainly embrace both senses of the term – for example, the legal recognition of same-sex marriage serves, on the one hand, to provide status and benefits formerly unavailable, while on the other hand, it subjects the couple to legal requirements of support that were formerly undertaken on a voluntary basis. This article focuses exclusively on the second meaning of legalization, the tendency of a jurisdiction to place problems under the control of the legal system.

At its most general, legalization describes two types of lawmaking. In the first, the legislature moves a private relationship or action to the public sphere by banning, requiring, or regulating it (although, in a common-law system, the regulation can often come from the courts) – for example, requiring employers to compensate their employees for injuries on the job. A second type of lawmaking subjects public political players (legislators, other elected officials, or state policy makers) to the orders of courts – for example, holding legislative and other political districts in which elections are held to articulated apportionment rules. In a hierarchical system such as American federalism, a 'higher' level of government may impose legal accountability on jurisdictions that fail to enforce their own legal requirements strictly enough. Analogous international institutions, through the United Nations (UN) and various treaty obligations, impose, albeit still imperfectly, human rights norms that can lead to prosecutions of public officials who commit genocide or violate human rights, even if those actions are authorized by their national law.

Legalization Generally

Taken over long periods, legalization as a process has been part of the development of all but the smallest of human societies. Placing responsibility for the control of many aspects of human behavior in the legal system is central to civilization itself. In the long run, legalization replaces the unfettered decision of rulers, the bonds of custom, and religious authority with the rule of law, applying predictable and stable legal rules to the citizenry equally and avoiding the imposition of arbitrary power. A familiar example is the growth of the common law in England over several centuries, as legal principles and policies absorbed rules and traditions of various institutions that once held sway over most aspects of life, including family, work, property, religion, and political relations.

But legalization can also be understood in a narrower sense; the spread of law and lawlike institutions need not be synonymous with the rule of law or constitutional order. Throughout the twentieth century, communist societies and certain others (most notably fascist Germany) dispensed with constitutionalism in fact while pretending to it in theory, even as legal decrees and rules infiltrated numerous activities, including the economy and social relations, which had been much freer of control under the prior regime.

Nor does legalization necessarily imply any particular content to laws, which may be as liberal or repressive as the regimes that promulgate them. For example, laws regulating travel across political borders, which were instituted as early as the sixteenth century, have varied considerably over the centuries, and from country to country, in the strictness of the compulsory passport system that most nations have created. Except during the American Civil War, no passports were required to enter or stay in the United States, and this situation lasted until World War I. Quite the opposite prevailed in France, beginning in the 1790s, and until the middle of the nineteenth century in much of Europe. Likewise, as a means of regulating internal travel, many countries adopted internal passport requirements, while others, notably the United States, have maintained steadfastly a constitutional right to travel without hindrance or papers.

In modern times, the process of legalization can be discerned most clearly in three primary developments: (1) the increasing legal regulation of activities and behaviors previously unregulated or regulated by other means; (2) the growth of private rights of action by which individuals may press legal claims against other individuals and the state; and (3) the spread of legal relations into the international sphere. The first two developments are closely connected, most especially in the United States.

Increasing Legal Regulation

In 1881, Oliver Wendell Holmes Jr, the future US Supreme Court justice, declared in his classic book *The Common Law* that "the general principle of our law is that loss from accident must lie where it falls, and this principle is not affected by the fact that a human being is the instrument of misfortune" (Holmes, 1963: p. 76). But at that very time, American law was undergoing a sea change; the law of negligence would transform many accidents into legally compensable events, and the courts were pulling down a barricade of rules against defendants' liability that they had constructed laboriously during much of the nineteenth century. The growth in American law closely followed the rise of industrialization, the explosion of technological development, and the spread of the market economy. Not all increases in the number of statutes and judicial decisions can be counted as legalization, since refinement and improvement in law is not necessarily the same as the spread of law and legal relations to new areas. Nevertheless, much of the outpouring of new law was part of the legalization of the country, a fitful, although eventually sweeping, movement toward 'total redress' (Lieberman, 1981: p. 31) or 'total justice' (Friedman, 1985). Throughout the twentieth century, the state endeavored to refashion the theory of harm (Lieberman, 2012) and to elaborate innovative ways of deterring and redressing the manifold injuries that came to be recognized as products of changing economic and social relations. This legalization of harm has unfolded in four principal ways.

First, from the 1880s to the time of this writing, the legislatures of the US states and the US Congress have enacted a tidal wave of statutes, dwarfing all previous eras of legislative enactment in all other countries. Since this is not a history of lawmaking, the list that follows is not intended as a chronology but rather as a snapshot of the kinds of activities that were enveloped by law during the twentieth century: labor and employee relations (including working conditions, pay, health, and safety), environmental pollution, consumer concerns (including banking and credit, housing, product safety, and advertising), the market mechanism (including antitrust, corporate structure, securities regulation, and the like), communications, elections, transportation, education, discrimination (by a host of institutions, public and private, on a variety of bases, including race, sex, ethnicity, religion, and disability), family relations (including marriage and divorce, child custody, and welfare), public assistance (including unemployment and health care insurance, welfare benefits, and old-age security), and personal relations (including sexual relations and procreation, and violence against women), to name only the most prominent of the areas that have come under legal sway.

Second, legalization has been enshrined in administrative bureaucracies created to manage a host of private relations. Although some statutes spell out bright-line rules (for instance, setting the drinking age at 21 years, or placing a ceiling on interest rates that may be charged), legislatures routinely delegate not merely enforcement power to administrative agencies to carry out major regulatory programs but also the very power to define the law. One measure of the scope of administrative law in the United States is contained in the pages of the *Federal Register*, the US government's official digest of proposed and promulgated federal regulations; it runs to around 60 000 pages annually. The impulse to legalize has thus created a vast bureaucracy and undercut the rule of law as understood by one of its leading proponents, A.V. Dicey, who, speaking of the British legal system in the nineteenth century, said "there can be with us nothing really corresponding to the 'administrative law'" (Dicey, 1959: p. 203).

Third, alongside the legislatures and administrative agencies, courts themselves have multiplied legal rights. The common-law understanding of harmful activity has expanded to encompass, for example, strict liability in tort, so that manufacturing operations that were once legally unapproachable in the absence of statutes have been a regular fare at the judicial feast. Likewise, the courts in the United States have expanded vastly the panoply of public rights, particularly in the arena of the Fourteenth Amendment's command that the states provide due process and equal protection of the laws.

Fourth, as a direct consequence of the preceding three developments, individual litigants have gained the right to take their multiplying grievances to court, as discussed in the next section.

Growth of Private Rights of Action

The widely observed penchant of Americans to sue springs from a rich tradition. As long ago as 1835, Alexis de Tocqueville observed, in an often quoted passage in *Democracy in America*, that "there is hardly a political question in the United States which does not sooner or later turn into a judicial one" (de Tocqueville, 1966: p. 248). Nevertheless, during the last quarter of the twentieth century, it became the conventional wisdom of many observers that the United States was suffering from something new: a 'litigation explosion' (Olson, 1991). Although the term is obscure, and such statistics as are available are subject to different interpretations (Galanter, 1983, 1993, 1996, 1998), the types of actions that plaintiffs may bring to court were greatly extended during the twentieth century. Many activities once entrusted to other domains – for example, politics – or left wholly unregulated and open to the whims of individuals, have become objects of legal oversight, in many instances prompting courts to assume administrative supervision of schools, prisons, and other major institutions not for the moment but for decades, a regime that has been termed 'democracy by decree' (Schoenbrod and Sandler, 2003).

Perhaps the most notorious example of the trend toward legalizing what was once purely political was the investigation of US presidents and high-ranking executive officials by so-called independent counsel. Although in form a public prosecutor, the independent counsel was in effect a combination of

a private lawyer and a client, since the executive branch was precluded from effective oversight of the prosecution. The independent counsel movement had its origins in the Watergate scandal in 1973, when the US attorney general authorized the appointment of a private lawyer as a special prosecutor and promised to keep the government's hands off the investigation. President Nixon's discharging of Archibald Cox, the first Watergate special prosecutor, led to a federal statute providing for the appointment of independent counsel by the federal court. (The law was allowed to lapse in 1999.)

A highly publicized instance of legalization of institutional behavior long thought to be private and outside the sphere even of political institutions was prompted by the worldwide pedophilia scandal in the Catholic Church. The revelations that thousands of priests had sexually abused children while their superiors shielded them from consequences led prosecutors in the United States and some other countries to enforce existing laws that had long been ignored and prompted legislators to enact new laws requiring evidence of such crimes to be reported to public authorities. Since the late 1990s, more than 3000 civil suits have been filed in the United States alone, leading to payouts totaling more than $1 billion and to the bankruptcy of several Catholic dioceses.

Other notable examples: The overthrow of racial segregation laws in the United States primarily began with cases filed in individual courtrooms in the 1950s. Apportionment of legislative districts, once solely a matter for political resolution (even in the face of constitutional commands widely disregarded by the legislators themselves), has become a cottage industry of litigation in the United States since the 1960s. In the 1970s, manufacturing and other practices were subject to sweeping oversight in court efforts to clean up the environment. Sexual harassment, a still evolving concept, became justiciable as the result of statutes and court decisions in the 1980s, overturning a centuries-long practice of remitting women to their private suffering in the face of it. In the 1990s, the tobacco industry was forced to pay hundreds of billions of dollars in health-related claims, largely through settlements in the wake of legal claims, and a similar but so far unavailing effort to control the distribution and sale of guns was mounted in the late 1990s. At the beginning of the twenty-first century, animal rights activists are attempting to prevent medical experimentation on animals by seeking to persuade courts to declare animals not merely property but possessors of rights.

Less generally discussed are the legal devices that serve as a spur to further legalization. In the Sherman Antitrust Act, for example, the US Congress authorized private individuals to sue for restraints of trade and monopolization by business interests, and the law permitted winning plaintiffs to recover both treble (triple) damages and their lawyers' fees from losing defendants. Other devices include contingent fees in personal injury suits; the class action, which permits the consolidation of small claims arising from the same event into a single suit, thus giving the plaintiffs' lawyers a financial incentive to proceed with the case; and the relaxation of so-called standing rules that determine who the proper party to file a suit is.

Legalization through private rights of action is not limited to the lawsuit itself. Understanding that lawsuits are always possible has led some people to fashion personal relationships as legal ones. Two examples from the marriage context are illustrative. Consider first the widespread use of prenuptial contracts allocating assets in the event of divorce, even before the marriage license is signed. More legalized still, apparently "some celebrities have asked wedding guests to sign nondisclosure agreements as a condition of attending a ceremony that might attract the interest of the tab[loid]s" (Beam, 1999: p. 64).

The consequence of growing legalization may alter conduct in ways that do not touch directly on legal relationships. For example, people may be more cautious in a law-saturated age about expressing opinions, even about matters with which they are professionally involved. During a Senate confirmation hearing, for example, US President Obama's 2013 nominee to head the Central Intelligence Agency refused to say whether he thought waterboarding constituted torture; although he called it 'reprehensible,' "I am not a lawyer, … and I can't address that question," he insisted (Terkel, 2013).

Growth of the Legal Profession

One measure of legalization sometimes propounded is the gross number of lawyers or lawyers per capita. In the United States, lawyers numbered about 285 000 in 1960 and more than quadrupled, to about 1.3 million, in 2013; per capita, the ratio rose from one lawyer for every 631 Americans in 1960 to one lawyer for every 243 in 2013 (however, perhaps only half the total are actually in practice). By comparison, in Japan in 2013, lawyers number around 30 000 (although the meaning of 'lawyer' is different and the comparison is not exact), for a per capita ratio of one lawyer for every 4233 Japanese. Whether these differences are meaningful, and if so, in what way, remains controversial. The number of lawyers may be explained at least as convincingly by the number and nature of transactions and interpersonal contacts as by some tendency to greater legalization. Quantifying legalization is a research task that remains to be undertaken.

Legalization in and of the International Arena

Historically, legalization has been an internal affair of each nation. Relations between nations have been governed by diplomatic and political process and, failing that, by war. But following World War II, the prosecutions of Nazi war criminals laid the groundwork for the principle that government officials are not legally free to do whatever they wish as leaders of sovereign nations, and they may not always claim immunity when finally caught. The Nuremberg trials established the concept that war crimes and crimes against humanity are justiciable. In modern times, the shield of diplomatic and sovereign-state immunity may be penetrated by the courts under certain circumstances.

In 1945, the UN established the International Court of Justice (ICJ) as its judicial arm. Located in The Hague, it is a tribunal in which member states may adjudicate claims against each other. ICJ rulings can be vetoed by any of the five permanent members of the UN Security Council, of which the United States is one. Despite obvious problems and a modest track record, it represents the ideal of submitting disputes to legal rather than political or military authority.

Although large numbers of war crimes since World War II have doubtlessly gone unpunished (only one major Vietnam war crimes case, concerning the massacre at My Lai, was prosecuted in the United States), by the 1990s a new sentiment led to the creation of two temporary International Criminal Tribunals, also situated in The Hague, with jurisdiction to investigate and prosecute acts of genocide and other war crimes in the former Yugoslavia and Rwanda. In 1999, then-President Slobodan Milosevic of Serbia became the first sitting president to be indicted by an international tribunal (along with other high officials of the regime), and in 2000 the International Criminal Tribunal began a series of prosecutions that garnered international attention. A similar temporary international tribunal, the Special Court for Sierra Leone, prosecuted Charles G. Taylor, former president of Liberia, who in 2012 became the first former head of state since Nuremberg to be convicted by an international court of war crimes and crimes against humanity; a special appeals panel upheld his conviction and a 50-year sentence in 2013 (Simons and Cowell, 2013).

Following the success of the early temporary tribunals, a permanent international tribunal, the International Criminal Court, was established in 2002 in The Hague under the so-called Rome Statute, a multilateral treaty to which more than 120 countries are parties (but not the United States). It is authorized to prosecute cases of genocide, crimes against humanity, war crimes, and the crime of aggression but only when individual nations are unable or unwilling to do so. In its first decade, it has acted in a handful of cases against leaders and military officers of eight African nations.

Domestic courts may also be willing to try such offenses. Perhaps a portent of things to come, in 2013 for the first time a former head of state was tried and convicted in his own country on charges of genocide and crimes against humanity; Gen. Efrain Rios Montt of Guatemala was sentenced to 80 years in prison by a Guatemalan court for directing the army during the 1980s to massacre Mayan families and wipe out their villages.

Other portents include successful civil suits against the estate of Ferdinand Marcos, the Philippine dictator, for human rights violations, and the 1998 British proceedings against former Chilean dictator Augusto Pinochet. He was arrested in London on a warrant issued by Spain, charging him with numerous civil rights violations during his 17-year rule in Chile, including murder, torture, and kidnapping. In the United States, the courts have been amenable increasingly to civil suits brought by victims of terrorism against their attackers. In 1998, for example, US federal courts awarded more than $300 million in two suits against Iran for its involvement in supporting terrorists involved in killing and kidnapping, and in 2000 Iran was ordered to pay $300 million in damages to one of the hostages taken in Teheran in 1980. Also in 2000, thousands of Filipino slave laborers conscripted by the Japanese Army during World War II filed a class action under California law against Japanese companies or their successors that forced them to labor in mines and plantations. In that same year, Congress enacted legislation enabling victims to collect damage awards from nations that sponsor terrorism, when those nations have assets in the United States.

These and other developments have led one political theorist to conclude that a 'dualistic world order' is in the making, with the development of international legal institutions that are semiautonomous from the world's sovereign nation-states (Cohen, 2012).

Legalization Outside the United States

Although the trend toward legalization is more advanced in the United States than in other countries, there is evidence that the direction of legal change is toward more law, not less; the increase in law is occurring in both industrialized Western nations and less developed nations worldwide, for the same reasons that the rule of law emerged in the West. A globalized economy demands stability, and globalized communications demonstrate to peoples everywhere the gap between stable and unstable legal systems. Not every nation fits this abstraction; despite its emerging markets, communist China maintains a strong political hold on its courts, just as religiously fundamentalist countries prefer clerical decrees to secular legal rules. In the West, what few comparative studies exist suggest that litigation rates in certain European countries, adjusted for differences in costs, are not appreciably different from rates in the United States (Galanter, 1992: p. 10). Two articles from the *New York Times*, chosen at random, suggest that the impulse toward legalization may be growing in radically different societies. A Chinese citizen sued Canon, Inc., a Japanese company, for $12 million for mental distress, because a computer disk promoting Canon's ink-jet printers said that China, Hong Kong, and Taiwan are separate countries, thus allegedly undermining China's sovereignty (Smith, 2000). In 2012, in a decision that alarmed scientists throughout the world, an Italian court convicted seven seismologists of manslaughter and sentenced them to 6 years in prison and ordered them to pay more than $10 million in damages for failing to predict an earthquake that killed 300 people in the city of L'Aquila in 2009 (Povoledo and Fountain, 2012). The case remains on appeal.

Some percentage of increased legalization may be attributable to the vast changes in global communications in the early twenty-first century, permitting instantaneous publication of and easy access to news that can pressure governments to act. The story of a woman in New Delhi who in December 2012 was brutally raped and murdered on a bus by a gang of thugs became an overnight sensation around the world. The news shook India, provoked protests throughout the country, where rape cases have been largely ignored, and forced the government to initiate a series of legal changes, including creation of a fast-track rape court (Barry and Sharma, 2013).

Continuing Trends

Without clear measures of legalization, it is impossible to predict at what pace it will continue, but there is no reason to suppose that the force of legalization will diminish. Increasingly it is the solution that political leaders favor to confront new hazards and challenges, and to reduce risks of all kinds. In 2008, for example, New York City mandated disclosure of calories on the menus of certain classes of restaurants in the hope of combating an epidemic of obesity; other cities and a few states have enacted such laws too, and a similar provision was included in the US federal health care act in 2010. Likewise,

increasing numbers of American states, as well as dozens of countries, now ban drivers from talking and texting on cell phones. Legalization is not limited to challenges posed by diet or technology. Rapid increase in international business transactions has led to many new laws, treaties, and conventions to regulate international trade. First ratified by 11 governments in 1988, the UN Convention on Contracts for the International Sale of Goods had 80 adherents by 2013. Nearly 80% of the world's nations, although not the United States, have ratified the UN Convention on the Law of the Sea, but even the United States accepts much of this regime regulating legal rights in ocean navigation and resources as binding international law. As nations, organizations, and even individuals around the world interact more often and more closely, it seems inescapable that legal regimes will be pressed into smoothing out the resulting collisions.

Abstract

Scholars who study legitimacy processes examine, for example, how new patterns of behavior, beliefs, and structures become legitimated, how the legitimacy of groups' status hierarchies emerges, and how authorities acquire legitimacy in organizations. Scholars also investigate the consequences of legitimacy. The stability provided by legitimated structures is the basis for much coordination and cooperation. Yet, legitimacy processes also perpetuate inefficient practices and inequalities, as well as allow advantages to high-status individuals and groups, limit responses to procedural and distributive injustices, and undermine collective identity and action among groups targeted by discrimination.

Definition of Legitimacy

The early twentieth century sociologist, Max Weber, argued that even though individuals may not always hold the same beliefs, norms, or values, their behavior still falls in line with the cultural beliefs and rules that they presume are accepted by most others. Because individuals perceive that other people support and accept this social order, the order seems like a valid, objective feature of social life. As a result, individuals act in accord with that order, whether they agree or disagree (Weber, 1978). This Weberian formulation offers a central insight for a working definition of legitimacy. Legitimacy is the taken-for-granted support of an aspect of social life (e.g., an action, a procedure, an individual, a position, or a structure of positions) by a real or an implied audience. It is fundamentally a collective process, and depends on the implied presence of a social audience that is assumed to accept the framework of beliefs, norms, and values. Finally, it has both a cognitive dimension, whereby an aspect of social life is perceived as valid and objective, and a normative dimension where this taken-for-granted social object is perceived as what is right (see Johnson et al., 2006 for a discussion of similarities in definition within social psychological and organizational literature, see Deephouse and Suchman, 2008 for discussion of the concept of legitimacy in organizational institutionalism, see Bobocel et al., 2010 for discussion of legitimacy and justice in psychology).

An example of legitimacy is seen in the interaction between referees and coaches. When a referee orders an unruly coach to leave the soccer field, it is typically not necessary for the referee to persuade the coach to leave. The coach may be very upset, throw his or her hat on the ground, or kick the dirt, but will ultimately comply with the referee. Compliance, obeying even when one privately disagrees, in this case occurs because both the referee and coach operate within a larger social system, with its set of roles, rules, and beliefs that go beyond any individual. This larger system is accepted and approved of by a majority of the social audience, including the players, the coaches, the fans, and the administrators of that particular league. There is, then, a general consensus that the referee has the right, in his or her role, to throw a disruptive coach out of the game, and that the coach must obey, even if he or she personally disagrees. Imagine if there was no legitimate order in soccer; chaos would ensue with every disagreement and conflict. These same sorts of legitimated roles and rules apply in a range of social settings including, but not limited to, courts, airports, and the workplace. In each of these settings, legitimacy acts as a sort of glue that holds together larger social systems in which people operate and interact with one another on a daily basis.

Many things can be legitimated. For example, a particular act such as a manager promoting a subordinate, an individual in a position (e.g., floor supervisor), a status hierarchy in a group, a practice or policy in an organization (i.e., family leave), a structure of positions in groups or organizations, or intergroup status relations in a society become legitimated through a social process in which people assume that other people in general accept the object for what it is and, often over time, for what it should be. Questions of legitimacy, then, repeatedly arise in studies pertaining to political and organizational structures, status relations in and between groups, and inequality.

Some scholars who study legitimacy processes examine how new patterns of behavior, beliefs, and structures become legitimated. Others study legitimacy processes in groups and focus on how the legitimacy of groups' status hierarchies emerges, and how authorities acquire legitimacy in organizations. Scholars also investigate the consequences of the legitimacy, for example, of status hierarchies in groups and status relations among groups, as well as the conditions under which these aspects of social life become inefficient and perpetuate inequality within groups, organizations, and society. They also investigate the consequences of legitimacy of authorities for interaction in organizations.

Legitimacy as a Social Process: Four Stages

Legitimacy theories examine how new patterns of behavior, beliefs, and structures become widely accepted into the broader cultural framework so that they become taken-for-granted aspects of social life. When comparing legitimacy research in sociological social psychology with institutional work in organizations, scholars reveal four stages in the legitimation of new social objects: innovation, local validation, diffusion, and general validation (Johnson et al., 2006).

In the first stage, a social innovation is created to address actors' needs, purposes, or goals in a local situation. One example could be the development of new procedures to meet federal policies in schools. Often, new social objects are created in reaction to changes in structural conditions, such as newly gained access to or the distribution of valued resources. For instance, a school may develop new procedures in order to obtain federal grant money for special projects. Responses to structural conditions create strategic interests or contingent events for actors in local situations. Clearly, some new objects never acquire legitimacy (e.g., subscription financing for commercial radio in the United States see Leblebici et al., 1991), whereas others do successfully become part of the broader cultural landscape, readily available and acceptable to other actors outside of the initial local context. In addition, sometimes the same innovation arises in several local contexts simultaneously.

In the second stage, the innovation is accepted locally. In order for this to occur, the local actors must construe the innovation as consistent with and linked to the existing, widely accepted cultural framework of beliefs, norms, and values (Walker, 2004). At the local level, where the innovation is initiated, actors may explicitly justify this link by providing accounts or justifications of how the innovation meets the needs and goals in a way that is clearly consonant with the existing cultural landscape. Or the innovation may gain local consensus simply by not being implicitly or explicitly challenged. Continuing with the example of education policies, a school committee may develop modules that fulfill the requirements of the federal grant, and justify these changes by showing how the modules fit within the current school curriculum. As result of either explicit justifications or being implicitly accepted because it is not challenged by actors, the innovation acquires local validation. A new prototype or cultural schema is adopted as the acceptable way of doing things to meet local needs and/or goals.

Once this new prototype or schema is locally validated, in the third stage, it may be diffused into other new, local situations. For instance, other schools in the district or state may adopt similar educational modules in order to secure grant funding, rather than developing their own modules to suit the needs of their students and curriculum. Because the innovation is now interpreted as a valid social fact, actors in other local situations are more likely to adopt it as mere fact. The diffusion process is partly a result of actors' expectation that people in other local contexts accept this new prototype. Importantly, actors are more likely to have this expectation when the innovation is perceived to meet goals/purposes that are consonant with already widely accepted goals (e.g., efficiency) (Walker, 2004). The innovation then becomes a useful and even necessary cultural schema for how and why people do things. As the innovation spreads, its adoption into new contexts needs less explicit justification than when it was adopted in the first local context. In addition, often the initially created innovation did indeed address some immediate goal or problem, but it may eventually become less useful and efficient in later adopter contexts, yet still be perceived as an acceptable way of doing things. For example, another theme of institutional scholarship focuses on how early adopters of an innovation are driven by technical concerns, whereas later adopters can be driven by emulation.

Over time, as a result of this diffusion process across local contexts, actors eventually assume that most people believe that the innovation is acceptable. As a result, the innovation acquires widespread acceptance, becoming part of society's shared culture. Initially validated either in one local context or in a few spontaneously, the innovation becomes generally validated, that is, becomes part of the status quo, and is used to frame the future behavior of actors across many contexts. For example, schools may continue to teach the same modules for years after the grant funding has run out, based on the notion that 'we always teach this.' Although there is certainly room for new prototypes to appear that challenge the original innovation, once a prototype/cultural schema becomes generally validated, it is not easily replaced compared to innovation that only remain locally validated.

Johnson et al. (2006) illustrate this four-stage process by drawing upon institutional theories in organizations to illustrate how two organizational forms, the for-profit corporate form and the nonprofit form in the arts, emerged in local contexts and then became part of the larger cultural framework (e.g., DiMaggio, 1992; Roy, 1997). They also examine how newly emerging status beliefs may become widely accepted as part of the broader cultural framework. Status beliefs are cultural schemas about which categories of individuals are thought to be worthy or unworthy in society. Drawing upon status construction theory (Ridgeway, 1991, 2011), they examine how a new type of worthy/unworthy actor in society may emerge from the transformation of a mere difference of categories of people (i.e., difference not attached to status value) into a widely accepted status characteristic (where two or more categories of a characteristic are differentially valued in a society). In this case, some categories of people (e.g., whites and men) are perceived as more worthy and competent than other categories of people (e.g., blacks and women) in general. They show how these new social objects, organizational forms and status beliefs examined at two different levels of analysis, have similar paths in terms of their legitimation processes.

Emergence of Legitimacy of Status Structures in Groups

Once status beliefs emerge in societies where a mere difference in categories of people transforms into a widely accepted status characteristic, these status beliefs drive the formation of status hierarchies in groups, as well as the legitimation process of these hierarchies. Status hierarchies develop in groups (e.g., committees, task forces, and gangs), where some members are seen as more worthy and esteemed than other members. Status structures of groups are rank-ordered relationships between group members where some members have low status and others have high status in the group. Individuals who have higher status in society tend to have higher status in face-to-face groups, and there are widespread cultural beliefs that indicate this pattern. In the United States, for example, men, whites, and middle/upper class individuals tend to have higher status and are perceived as more competent and

worthy in general than lower status groups like women, blacks/Latinos, or poor/working class individuals. Because of this link between states of social characteristics and general competence beliefs, these members are more likely to offer their opinions and be more influential in decision making. As a result, they are also afforded high status in specific groups, and their opinions are more likely adopted than opinions of other group members. A status structure thus forms in which these members have higher status than other members who possess the less valued state of the characteristic (Correll and Ridgeway, 2003). How does this status structure become accepted and supported, either implicitly or explicitly, by the group members, where they believe that the high-status members should have high status in the group?

Legitimacy theories argue that low- and high-status members in a group expect that those who possess highly valued states of characteristics will also occupy highly valued positions within the group because this is typically what they perceive around them. In other words, individuals with highly valued status characteristics are also likely to hold high-status positions in groups within occupational, economic, political, and religious structures in general (Correll and Ridgeway, 2003). For example, white men are typically seen in top positions in political, educational, and economic institutions (e.g., Chief Executive Officers of Fortune 500 US companies and Fortune Global 500 companies, brokers on Wall Street, and senators in the United States). In addition, clergy, rabbi, and other religious leaders in religious institutions are still predominately men.

Consequently, when individuals advantaged in terms of status characteristics become high-status members within a group, low- and high-status members tend to react to this as if this ranking should have happened this way because they, in fact, expected it. Thus, low-status members enact deferential behaviors such as giving esteem, respect, and honor (communicated verbally or nonverbally) toward high-status members. This interaction creates a process where everyone believes that everyone else supports who is more worthy and exercises more influence. Members believe that other members support the status structure. If no one challenges this pattern of deference, members will continue to act as if this should happen, and the hierarchy becomes implicitly legitimate.

Emergence of Legitimacy of Individuals in Authority Positions

Scholars also examine how individuals in authority positions acquire legitimacy. Authority refers to the ability and right of an actor (e.g., an individual, an organization, or a governmental body) to issue orders to others. The actor with authority has rights vested in the position to direct, regulate, and evaluate the behavior of others, within limits. Individuals in authority positions have a range of directives that are considered appropriate, such as determining work assignments, pay, and evaluating performance.

Studies show that individuals in authority positions are more likely to be legitimated when their appointments are based on qualifications and past achievements and are designated by someone from the top of the authority structure (i.e., when they are supported from above or authorized) (Zelditch and Walker, 1984). They are also more likely to be accepted as the authority when they are supported by their subordinates and peers (i.e., endorsed).

Authorities acquire support from subordinates, in part, in two fundamental ways in which they interact with their subordinates: (1) the use of fair procedures when making decisions and (2) the benevolent use of their power. Authorities are perceived to use fair procedures when they make decisions that are seen as unbiased, respectful, consistent across individuals, and they take into account subordinates' views. An authority's use of fair procedures and treatment ensures that subordinates feel respected within their group, which in turn increases subordinates' feelings of self-worth (Tyler, 2001). Many scholars assume that individuals are motivated by and desire positive social identities from their standing in a group and the value of their group. The use of fair procedures by authorities signals to the subordinates that they are respected within their group. Therefore, when an authority uses fair procedures to make decisions, the legitimacy of that authority increases.

Authorities also gain endorsement when they provide resources to their subordinates that benefit their welfare (Blau, 1964). Authorities often have opportunities to contribute to their subordinates' welfare by distributing rewards that support them in being successful in their jobs. For example, they have access to valuable knowledge, skills, training, and strategic information that is useful to subordinates. They may also offer guidance, assistance, and advice to enhance and facilitate subordinates' work. When authorities provide rewards that contribute to the collective interest of subordinates, joint obligations between the authority and the subordinates arise (Blau, 1964; Hegtvedt and Johnson, 2009). Repeated successful exchanges (exchanges of rewards and cooperation) between authorities and their subordinates are likely to stimulate perceptions of trust and fairness and feelings of social obligation (Lawler, 2006; Molm, 2006). Taken together, using fair procedures in decision making and distributing valued rewards fairly among subordinates contribute to a collective sense of legitimacy. That is, subordinates perceive that other subordinates support the authority (i.e., endorsement) and this, in turn, perpetuates the authority's legitimacy.

Additionally, authorities can also acquire legitimacy based on their interactions with and ties to other more powerful and legitimate members of the organization, as well as their peers. Legitimacy (and power) comes from breadth and depth of these social connections, especially those that are outside one's immediate group (Smith-Lovin, 2007). For example, sponsors or top managers can support leaders in their positions, allow them to bypass red tape, provide them with inside information, and give them status purely by association. In addition, alliances with peers allow for direct exchanges of resources such as favors, information, and challenging and visible work assignments.

Consequences of Legitimacy of Authority

Legitimated social structures, procedures, and actions tend to remain stable. In the case of status hierarchies or authority

structures, in some contexts, the legitimacy of authority relationships fosters stability, coordination, and cooperation in the interactions between members of the organization (Dornbusch and Scott, 1975; Zelditch, 2006). The benefits of legitimacy often have downsides, however. Just as legitimacy helps to maintain order and stability, and prevent chaos in some situations, in other situations legitimacy upholds inefficient practices and contributes to the perpetuation of inequality within and among groups, organizations, and societies. Furthermore, while the benefits of legitimacy are greater for women and minorities, these individuals often have the most difficulty becoming legitimated. These consequences are taken in turn.

Some positive outcomes of legitimacy processes, in certain situations, are solidarity, cooperation, and productivity. Subordinates who perceive their superiors as legitimate authorities are more compliant and deferential, and they also perceive legitimate authorities as more effective and influential. These authority figures have a broader range of directives they may give to subordinates, assuming that these directives fall within the scope of their authority.

Legitimacy also fosters organizational stability because in conflict situations, legitimated authorities are more likely to elicit compliance by their subordinates, as opposed to authorities who are not legitimated who may have subordinates form coalitions or go above their heads to resolve the conflict (Johnson et al., 2000; Johnson et al., 2006). In addition, if members do not defer to high-status members in the group, they face the threat of informal sanctions from other group members. As a result, compliance with high-status members is expected and, in fact, is what typically occurs. This pattern of behavior, then, maintains the status quo (Correll and Ridgeway, 2003). While the ability of legitimated authorities to avoid conflict in this manner may lead to better outcomes for those who have high status and greater cooperation within the organization, this also points to key problems caused by legitimacy: it may aid in the persistence of inefficient practices and inequality.

Legitimated authority structures have staying power, in part, because when individuals perceive a system is supported by others they are more compliant and engage in fewer observable efforts to change it. In fact, when a system is perceived to be authorized and endorsed, its stability and ability to elicit compliance persist even in the absence of individual propriety (i.e., personal support for the system). Their persistence is related to the perception of collective support, rather than the appropriateness or effectiveness of the structure. This is not to say that individuals do not recognize practices as inefficient or unfair. Rather, the issue is the pressure to change the system is countered by pressures of legitimacy that negate attempts to change the structure (Zelditch, 2006). These pressures include the appearance of consensus, making people think that the legitimated structure or practice is just 'the way things are,' and a system of sanctions for noncompliance. Sanctions may be formal or informal, ranging from actions such as negative evaluations from supervisors and stunted pay growth to having one's ideas dismissed publicly or social exclusion. In the face of seemingly widely supported authority, possible repercussions for noncompliance may appear too costly based on perceived prospects for success in changing the system.

An example of compliance even in the absence of propriety can be found in airport security. While individuals may be opposed to the procedures in airport security, or consider them an ineffective means of ensuring public safety, they are unlikely to act out against this system. Even when airline passengers are personally inconvenienced or perhaps feel violated by security procedures, they are likely to assume that other people agree this system is necessary to ensure their safety and these procedures are the most effective way to achieve that goal. Furthermore, going against the grain would likely have a range of negative consequences, formal and informal. Informal consequences could include upsetting or delaying other passengers by refusing to remove personal items or be screened, but formal consequences could include issues such as having personal belongings confiscated or being denied permission to fly.

On the positive side, the aforementioned benefits of legitimacy are greater for women and minorities in authority positions, because they are less likely to receive cooperation and deference when they are not legitimated. For instance, when female leaders receive institutionalized support and authorization, they have more influence than if they were assigned to leadership roles randomly or by task ability. These female leaders do not achieve the same influence levels as male leaders who were selected based on task ability, but it remains that disadvantaged leaders can attain influence comparable to other more advantaged actors when they have institutional support (Lucas, 2003).

Despite the benefits of legitimacy for disadvantaged groups like minorities and women, however, individuals in these groups often have the most difficulty acquiring legitimacy. Barriers to legitimacy are often rooted in double standards women and minorities face in regard to proving competency (Foschi, 2000). Gender and racial stereotypes associated with assumptions about competence make it more difficult for women and minorities to become legitimated in their positions. Yet, having legitimacy affords high-status group members the right to use dominance in groups to ensure compliance (Ridgeway et al., 1994). Given that women and minorities are less likely to acquire legitimacy in groups, they are not expected or allowed to behave in dominant ways. If they do, they are often perceived to be overly directive. Women and minorities, then, are more likely to be perceived as assertive and strong willed than men and whites who employ the same behaviors and are considered competent (Eagly and Carli, 2007). These findings show that low-status group members are more limited in the range of behaviors they can effectively engage in, even if they are placed in high-ranking positions. In addition, people who occupy positions of power without being legitimated also focus more efforts on attending to negative stereotypic attributes and information about their subordinates (Rodriguez-Bailon et al., 2000), presumably in order to justify their position and maintain the existing social structure. Thus, legitimacy plays a role in maintaining stereotypes.

Scholars also consider the effects of legitimacy when existing authority structures combine, as in the case of organizational mergers (Terry and O'Brien, 2001). They find that when

the organizations of varied status levels merge, and their status differences are legitimated, members from the low-status group are more likely to identify as members of the new organization, to view the new organization as a collective identity for members of both prior organizations, and to experience less threat and distress from the merger. Members of the higher status group, however, are less likely to see both groups as members of one common organization, and experience more distress during the merger. This pattern may emerge because high-status members are concerned that the merger may provide opportunities to challenge their status.

Consequences of Legitimacy of Deviance, Resource Distributions, and Discrimination

Scholars also focus on the consequences of the legitimation of deviance, unjust distributions of resources, and discrimination. While deviance is, by definition, behavior that violates the norms of a collective, deviant behavior may also be legitimated in certain contexts by smaller groups. For example, when people perceive that their peers support deviant behavior they are more likely to cheat, even if cheating behavior provides the same self-serving benefits in the presence or absence of endorsement from peers (Younts, 2008).

Scholars examining the perceptions of injustice to distributions of resources consider how the legitimacy of the outcome distribution may affect these perceptions. When resources are allocated in an unfair way, individuals are less likely to perceive the outcome as unjust if the distribution is legitimated (Hegtvedt and Johnson, 2000). Under these circumstances, disadvantaged actors will experience less severe negative emotions, and thus are less likely to respond behaviorally. When unjust distributions are highly legitimated, actors will respond to the injustice psychologically rather than behaviorally. Similarly, in organizations where promotional procedures are legitimated from above and below, workers are less likely to question the fairness of the rewards they receive from the company. In fact, legitimacy proves more important than self-interest in influencing perceptions of justice in these cases (Mueller and Landsman, 2004).

Social processes like discrimination can also be legitimated. For individuals who are members of groups targeted by discrimination, the effects of the discrimination vary based on whether or not individuals perceive the discrimination is legitimate. Group members who perceive the discrimination is illegitimate are less likely to experience self-directed anger, which provides a buffering effect between the discrimination and an individual's self-esteem. Alternatively, those group members who perceive the discrimination as legitimate are more likely to experience self-directed anger, exacerbating the effect of the discrimination. In these cases, the individual internalizes the idea that his or her group membership is a reasonable basis for the negative interaction (Hansen and Sassenberg, 2011). When discrimination is legitimated, individuals are less likely to identify with the targeted group, and therefore less likely to act collectively (Jetten et al., 2011). The inability to act collectively has clear implications for maintaining the status quo.

In summary, legitimacy of social structures and procedures has some positive outcomes in the form of maintaining social order and efficiency. The stability provided by legitimated structures is the basis for much of daily life. Unfortunately, legitimacy processes also perpetuate inefficient practices and inequalities by providing more support and allowing more agency for individuals with status advantages, limiting responses to procedural and distributive injustices, and undermining collective identity and action among groups targeted by discrimination.

Delegitimation

Legitimacy may be a driving force in maintaining the status quo, for better or worse, but the stability and consistency of legitimated social objects is not absolute. The legitimacy of problematic structures can be and is at times challenged, and this provides the opportunity for new status hierarchies, cultural schemas, practices, and procedures to emerge. For example, challenges to status hierarchies may arise both externally and internally. If contradictions emerge in the evaluation of a high-status member, for example, that actor may stand to be delegitimated in his or her status position (Berger et al., 1998). Also, a leader may enjoy authorization and endorsement within the organization, but if an authority figure from outside the organization gives a negative evaluation of the leader and his or her work, this calls into question the leader's fitness for the position internally as well.

Scholars focusing on intergroup relations examine how intergroup competition may bring about social change (Hogg, 2006). Under certain conditions, when status-disadvantaged groups believe their position is illegitimate or unstable, they may conceive of a different social order and engage in intergroup competition to bring about change in their status. Research conducted with East Germans who perceived their group as inferior to West Germans during the reunification highlights how legitimacy and stability affect intergroup competition (Mummendey et al., 1999). This study shows that separatists, who see the status differences between East and West Germans as stable and illegitimate, and view the boundaries as impermeable, are distinct from assimilators who see the status differences as unstable and legitimate, and view the boundaries as permeable. They find that separatists identify more strongly as East German, and are less inclined to leave their own group and identify with the recategorization as Germans. Additionally, separatists display more social competition in attempts to elevate the status of East Germans than do assimilators. These challenges to the legitimacy of a status hierarchy may not be sufficient to delegitimate the status hierarchy independently, but they serve as chinks in the armor of legitimacy, providing opportunities for new structures that have the potential to be more efficient and equitable.

The understanding of the process of delegitimation of a social object is limited, but it may be that this delegitimation process begins with a change in the structural conditions that currently underlie a social object, even if these conditions are different from the original ones at the early stage of innovation. Even so, does the delegitimation of a social object require being

replaced by a new social object? For example, must new organizational forms and practices be created and legitimated for old forms and practices to be perceived as inappropriate or inefficient? Can a social object lose widespread acceptance by an audience without anything to replace it? Finally, taken-for-granted notions of gender, race, sexual orientation, and religion may disappear, but can they disappear without being replaced by other taken-for-granted ideas that privilege some groups over others? These and many other questions remain, but the study of legitimacy as a social process, and the antecedents and consequences of legitimacy, also remains essential in understanding social life.

Leisure Activities Choices among Adolescents

Maria K Pavlova and Rainer K Silbereisen, Center for Applied Developmental Science (CADS), Friedrich Schiller University Jena, Jena, Germany

© 2015 Elsevier Ltd. All rights reserved.

This article is a revision of the previous edition article by R.K. Silbereisen, volume 1, pp. 122–125, © 2001, Elsevier Ltd.

Abstract

In this article, we provide descriptive time-use data on adolescent leisure. Next, we link normative developmental tasks or concerns of adolescence to the context of leisure. We then outline other, nondevelopmental factors of adolescents' leisure participation, such as external constraints, individual motivation, and personality differences. Finally, we review the methods used to assess leisure participation and motivation in adolescence, touch upon the implications of leisure for adolescent health and development, and outline possible avenues of intervention.

Leisure is typically understood by researchers as freely chosen and enjoyable activities that are pursued during one's discretionary time (Kleiber, 1999). Adolescence (here loosely defined as the second decade of life) is a developmental period when growing autonomy fosters (and is fostered by) independent decision making, making the study of leisure choices particularly relevant. However, beyond individual choices, sociologists, psychologists, and researchers in tourism and recreation have studied a broader spectrum of reasons or causes underlying participation in particular leisure activities. In this article, we summarize these diverse perspectives. First, we describe time-use data on adolescents' leisure behaviors. Second, we classify leisure activities in terms of the common psychological functions of leisure. Third, we link normative developmental tasks or concerns of adolescence to the context of leisure. Fourth, we summarize potential nondevelopmental influences on adolescents' leisure participation. Finally, we review the methods used to assess leisure participation and motivation in adolescence, the implications of leisure for adolescent health and development, and possible avenues of intervention. As the relevant literature is predominantly based on Western, mostly U.S. populations, this article represents these populations better than the rest of the world, but we introduce a cross-cultural perspective wherever possible.

Leisure Time Use in Adolescence

Leisure time available to adolescents varies across regions of the world, due to differences in school enrollment, in the hours spent in school, and in adolescent involvement in productive work (Larson and Verma, 1999). Working adolescents from nonindustrial, unschooled populations report having 4–7 free hours per day; across European nations, adolescents report having 5.5–7.5 free hours per day; in East Asian postindustrial countries where school achievement is important (Nishino and Larson, 2003), adolescents have only 4–5.5 free hours per day (estimates averaged across school days and weekends; more recent data are not available for these countries). By far, U.S. adolescents enjoy the largest amount of free time: Older adolescents have approximately 8 free hours per day, whereas older Canadian adolescents report having 6 free hours per day.

Most Prevalent Activities

Where TV and other mass media are widely accessible, electronic media use (passive activities, such as watching TV and listening to music, as well as more mentally challenging undertakings, such as Internet surfing, video games, and communicating with others) is the most popular leisure activity among adolescents: In the US, for example, a Kaiser Family Foundation study revealed 4 h per day spent watching TV, 3 h spent using computer, 3 h of music listening, 2 h of talking and texting via cell phones, and 0.5 h of reading. About a quarter of this time involves multitasking – using more than one medium at a time; thus, pure media consumption is less than suggested by these estimates.

A sizable portion of adolescent free time is spent in public places, such as parks, cafes, movie theaters, and shopping malls, and at somebody else's home. Visiting, hanging out, shopping, and dating, all forms of socializing, mostly with peers, account for 1–1.5 free hours per day among adolescents in the US, Canada, and the UK. However, in Islamic and East Asian societies, where adults impose restrictions on adolescent peer interactions and do not encourage seemingly purposeless pastime, considerably less time is spent socializing with peers, especially other-sex peers.

Sports and other forms of physical activity are also popular, accounting for more than 1 h of free time in the US and Norway, 0.5–1 h in Europe, Canada, and Australia, and less than 0.5 h in East Asian countries. Higher levels of physical activity are common in rural, nonindustrial populations because of ample opportunities to work or play outdoors.

In urban regions and postindustrial countries, adolescents can take part in structured extracurricular activities such as organized sports, school clubs, youth organizations, performing arts opportunities, and volunteering (Mahoney et al., 2005). Despite the variety of options and the fact that adolescents can engage in more than one extracurricular activity at a time, such activities take less than 0.5 h of daily time even in

the US, where extracurricular programing is most developed, partly because not all adolescents participate in such programs. In less affluent regions or in societies where adolescents are supposed to spend the better part of their free time with the family, extracurricular activities are uncommon.

Various productive and intellectual activities, such as performing arts, playing chess, gardening, and cooking, may be pursued individually (or at least not in structured settings) as hobbies. Time-use estimates are difficult to obtain here because of the unsupervised and unsystematic nature of many such activities, but available evidence suggests that they take a relatively small proportion of adolescents' time on average. For instance, time playing a musical instrument ranges from 5 to 30 min per school day in the US and Europe. Finally, although it is disputable whether religious activities, praying in particular, should be regarded as leisure or rather as obligatory activities, they constitute a salient time-use category in religious populations, accounting for nearly 10 min of adolescent time daily in the US and Canada and more than 1 h per day in Indonesia.

A sizable proportion of adolescents' waking hours is spent alone (20–25% in rural regions and 30–35% in urban regions). These estimates include time spent on homework and self-care, and perhaps on what could be considered leisure activities. Time alone is most often spent in one's own bedroom (if one has a private bedroom), although solitary walks are also quite common where the neighborhood is safe and attractive natural settings are available.

Activity Portfolios

Studies conducted in the US typically yield two opposite patterns of activity participation: Highly involved adolescents report being engaged in many activity domains (doing sports and taking part in other extracurricular activities, socializing with peers, reading, using electronic media, etc.) and sometimes also working for pay. In contrast, uninvolved adolescents are usually not employed and report predominantly unstructured and rather passive leisure activities, such as watching TV, hanging out with friends, and sometimes pursuing individual hobbies. The highly involved group includes 11% to more than 50% of adolescents, depending on the number of activities taken into account. The uninvolved group makes up 12–25% of adolescents studied. Between these two extremes, a large number of adolescents focus on one or two activity domains. Across the board, socializing with peers is very common, with only a very small minority of adolescents reporting little or no peer interaction.

Demographic Differences

Because of their typically heavier domestic workload and greater diligence at school in many countries, female adolescents report having less discretionary time than male adolescents. Female adolescents also tend to engage in different leisure pursuits than their male peers do. Across societies, female adolescents spend less time than their male peers participating in sports, playing video games, and watching TV, but more time reading and engaging in performing arts. In Western societies with little restriction on peer interactions, females devote more time than males to socializing with peers. In contrast, in Islamic and East Asian countries, female adolescents spend less time with peers than males.

In the US, marked racial and ethnic differences also exist: Latino and African-American adolescents, who are often economically disadvantaged, are less likely to participate in extracurricular activities than European-American adolescents and spend more time watching TV. African-American adolescents are particularly less involved in sports and spend more free time with family members and less time with peers than European-American adolescents.

As regards age differences, in Western samples, there is a decline in TV viewing from early to late adolescence in favor of music listening and talking on the phone and a decrease in sports and other organized activity participation and time spent with the family in favor of unsupervised time spent alone and with peers.

Leisure Types and Functions

Various leisure types have been described. One dichotomy is between active and passive leisure. Active leisure involves some challenge, combines effort and enjoyment, and thereby brings opportunities for learning and skill building, be it social, musical, motor, or any other skills and competencies. Passive leisure encompasses a broad range of nonchallenging activities, from watching entertainment programs on TV to idling. Its main functions are pleasure, relaxation (often in the context of coping with stress; Nishino and Larson, 2003), and filling free time. A more narrow distinction, used in the public health literature, is between physically active and sedentary leisure.

Stebbins (2007) divided leisure into casual, serious, and project-based activities: Serious leisure activities are skill-based, require considerable effort and persistence, and provide durable benefits, such as self-actualization, self-expression, and self-enrichment, as well as identification with a group of like-minded people and social recognition. Project-based leisure includes short-term, moderately complicated, creative undertakings that require planning, effort, and skill but are not associated with a long-term commitment. Finally, casual leisure includes pleasurable activities that require little special training to enjoy them. Apart from its purely hedonic and recreational functions, it fosters the development and maintenance of interpersonal relationships, as many social interactions occur in the context of casual leisure (e.g., a family dinner).

A conceptually similar distinction has been made between structured and unstructured leisure during childhood and adolescence. Structured leisure occurs in organized settings, such as schools or sports clubs, is supervised by adults, is performed in a group of youth, and otherwise fulfills the criteria for active leisure. It is therefore similar to serious and project-based leisure, with an emphasis on adult supervision and guidance that vary from quite directive to more subtle as when an adult acts as a facilitator and youth are allowed to make decisions and plan their activities themselves (Mahoney et al., 2005). Unstructured leisure may involve both active (e.g., hobbies) and passive (e.g., hanging out) leisure undertakings and may take place both with and without adult supervision;

its distinctive feature is a lack of an agenda and organization, analogous to casual leisure within Stebbins's classification.

Adolescent Development and Leisure

Adolescent leisure activities are both a manifestation of emergent developmental tasks and concerns and a context that offers opportunities for these tasks and concerns to be resolved (Kleiber, 1999). In this section, we discuss both of these.

Adolescent Brain

Adolescents are notorious for their propensity to engage in risky behaviors (e.g., unprotected sex, substance abuse, and drunk driving), especially in the context of unstructured and unsupervised leisure in a company of peers. Recent research in developmental neurobiology suggests that risk taking in human adolescents may be linked to brain maturation during this period. More specifically, whereas the cognitive control system (associated with cortical brain regions, e.g., prefrontal cortex) matures gradually from childhood into young adulthood, more rapid changes in the incentive processing system (associated with limbic subcortical regions, e.g., nucleus accumbens) occur during adolescence, which entail heightened reactivity to rewards, especially social rewards. As a result, the adolescent cognitive control system, although more mature than that in children, is not yet fully developed and may not adequately inhibit impulsive responses to immediate rewards. At the behavioral level, this nonlinear developmental dynamics may lead to adolescents performing well on logical reasoning and cognitive estimation of risks but still making risky choices in emotionally laden, potentially rewarding situations that are most likely to occur during peer interactions. If such biological factors do, to some extent, influence adolescents' leisure preferences, this may be especially true in societies in which adolescents have a great deal of leisure time and relatively low levels of adult supervision.

Identity Development

Erik Erikson considered adolescence as a critical period in the formation of personal and social identities, which occurs through exploration of different options and subsequent commitment to some of them. The context of leisure offers ideal opportunities for identity exploration, as leisure presumes more freedom and fewer obligations than school or paid work. Alan Waterman suggested that in the process of identity formation, some adolescents may follow the discovery metaphor, attempting to find their 'true selves.' They seek to engage in 'personally expressive' activities that fit with their hidden potentials and are experienced as both challenging and enjoyable (cf the concept of flow below). Indeed, several empirical studies suggest that sustained involvement in structured or serious leisure (e.g., sport, volunteering) is associated with a more mature identity and with personal growth experiences. In addition, voluntary solitude and quiet contemplation may be used strategically by adolescents to find their 'true selves.' Interestingly, solitude and privacy are increasingly desired by adolescents, perhaps allowing them to arrange a space (e.g., private bedroom) that reflects their unique personalities.

In contrast, the creation metaphor implies that there is no 'true self' to discover but that adolescents adaptively construct their selves, fitting their personae to the available options and expectations of others. Identity creation requires more extensive exploration and experimentation with possible selves, as well as more feedback from others, than identity discovery. Again, leisure settings provide excellent venues to create various potential identities. The creation metaphor may help us understand why many adolescents try to adopt a particular image (e.g., with respect to clothes, musical taste, and favorite movies), abruptly change their images, are fascinated with interactive media, and sometimes enjoy playing with different identities in anonymous chat rooms or in online role-playing games.

But is either the discovery or the creation of an identity good for adolescents? It depends on the breadth of exploration and on the social desirability of choices made. In fact, the quest for identity can be associated with maladaptive leisure choices (Kleiber, 1999). For instance, there is some evidence that adolescents with low self-concept clarity and poor social skills may overuse the Internet, probably in an attempt to overcome these difficulties. Moreover, members of youth gangs have a strong sense of social identity, and their delinquent activities are both challenging and enjoyable to them. Similarly, overinvestment in and overidentification with a single activity (e.g., fandom) may satisfy one's need for identity but limit personal development. Thus, having access to diverse leisure opportunities that are both enjoyable and socially desirable is vital to normative identity development in adolescence.

Parents

Throughout childhood, parents serve as primary role models concerning leisure activities; many adolescents continue to pursue leisure interests that are similar to those of their parents. Joint leisure activities also remain quite common. Drawing on their beliefs about their children's abilities and needs, parents may encourage or discourage participation in certain activities and provide corresponding facilities. Parents may also influence leisure choices of their offspring indirectly, through their general parenting style. In particular, authoritative parenting, which combines warmth, autonomy support, structure, and discipline, fosters the development of social competence and responsibility and thereby promotes healthy leisure choices in adolescents. In contrast, when adolescents feel controlled and mistrusted or neglected and unguided, they may be drawn toward passive leisure and unstructured, unsupervised leisure in the company of deviant peers.

Peers and Youth Subcultures

As peers and peer groups gain in importance (particularly in Western societies), adolescents choose leisure activities that make them popular among peers (e.g., skateboarding), are performed by friends and romantically attractive peers, and/or give them opportunities to socialize with peers without

adult supervision, whereas adult-supervised activities, even interesting and useful ones, gradually lose their appeal. Peer-focused activities can have both positive and negative consequences, depending on the values of the peer group. In addition, adolescents may avoid activities where they expect or experience peer rejection and victimization (e.g., overweight teenagers often withdraw from organized sports).

Adolescents are exposed to and attracted by broader youth subcultures or lifestyles such as those exemplified by high school 'crowds' (e.g., brains, jocks, and Goths). Youth subcultures are often associated with a distinct outward appearance (especially clothing), jargon, musical style, and leisure preferences. Belonging to a particular subculture therefore defines a whole range of behaviors. Initially, it was thought that subcultures emerged among working-class youth in response to social problems, as a symbolic means of protest. Now that youth subcultures and lifestyles have become commercialized and widely popularized in media, they are rather regarded as a way to celebrate one's distinctness (as a group and as an individual) and to have fun.

Changing Relational Concerns

John Coleman and Leo Hendry's focal theory linked age-graded relational concerns with leisure transitions during adolescence. According to Hendry, adult-organized leisure activities of early adolescence are displaced by casual (unstructured) leisure pursuits in middle adolescence, activities that mainly consist of socializing with peers and reflect developmental concerns about peer acceptance and rejection. In late adolescence, casual leisure gives way to commercialized leisure (e.g., visiting pubs, discotheques, sport clubs, or wellness centers), which adolescents use to affirm their maturity and independence from parents. Although empirical studies yield mixed support for this particular sequence of events (in affluent societies, commercialized leisure currently dominates even among younger children), the focal theory underscores the importance of changing developmental concerns in leisure activities choice. In a similar vein, Silbereisen et al. (1992) showed that adolescents' choice of public or private leisure contexts depends on their progress in romantic friendships. For instance, adolescents hoping for a relationship prefer public hangout places, where they can meet potential romantic partners, but once a relationship has been initiated, couples retreat to more private leisure settings.

Autonomy Development

Achieving an optimal level of psychosocial autonomy from both parents and peers is a major developmental task of adolescence. Leisure becomes truly leisure only when individuals can freely choose their activities; therefore the context of free time becomes an important arena (and sometimes a battlefield) of autonomy development (Kleiber, 1999). Whereas unstructured and unsupervised peer time serves as an escape from adult supervision, time spent alone helps in keeping a distance from peers as well. By experimenting with and combining different leisure options, adolescents gradually learn to balance the conflicting expectations of parents and peers with their own emerging interests.

Gender Role Development

Socialization into masculine and feminine gender roles and the formation of gender role identity begin in early childhood. Gender-typed behaviors (e.g., playing with dolls or with cars) first emerge in the family context and are then reinforced in gender-segregated peer groups throughout childhood and adolescence. Although puberty is sometimes characterized as a period of gender roles intensification, in general, gender differences in adolescent leisure activities reflect a continuation rather than an abrupt increase in gendered behavior patterns. Furthermore, large interindividual differences exist in the extent to which gender role stereotypes are acquired and followed throughout childhood and adolescence. Last but not least, gender typing is a cultural phenomenon; for instance, Muslim cultures hold very strict notions about the gender appropriateness of particular activities, whereas gender-related expectations are much looser in contemporary Western societies.

Understanding Individual Differences in Leisure

In this section, we introduce major explanations of leisure preferences and participation that apply to adults and adolescents alike. Some of these theoretical accounts offer a developmental perspective, some do not. We will illustrate them with examples from adolescent research.

The Ecology of Leisure: Constraints–Facilitators Framework

In leisure research, the hierarchical model of leisure constraints (Crawford et al., 1991) is commonly used to explain variations in leisure participation. Constraints are objective or perceived factors that inhibit formation of leisure preferences, prevent individuals from enjoying a particular kind of leisure, or hinder them from participation altogether. Intrapersonal constraints represent individual barriers to leisure participation, such as a lack of interest in a particular activity, a belief that one's skills and abilities are insufficient, a lack of knowledge about available leisure opportunities, and health conditions (e.g., disability). Interpersonal constraints explain the lack of participation at the level of relationships and group attitudes, such as a lack of company and disapproval from significant others. Structural constraints include institutional and economic barriers, such as a lack of time and money, poor availability of leisure facilities, unsafe neighborhood, and legal restrictions. Finally, sociocultural constraints, such as restrictions on women's participation in certain leisure activities, have recently been suggested as an additional level of analysis. The constraints model has been criticized for its implicit assumption that nonparticipation is always bad and for its failure to consider the role of resources and other positive factors eliciting motivation, promoting formation of leisure preferences, and encouraging leisure participation, factors that have been called facilitators to leisure.

In research based on the constraints model, adolescents report negotiating constraints to leisure at all levels except for the sociocultural, a level of which they seem unaware. Typical examples include disinterest and perceived lack of skills (intrapersonal); parents imposing restrictions on youth's

leisure activities and friends being uninterested in certain activities (interpersonal); and inadequate recreational facilities, financial constraints, limited accessibility of attractive leisure sites, and dangerous neighborhoods (structural). Adolescents' subjective perceptions aside, structural and sociocultural constraints, such as race, gender, and socioeconomic divisions in adolescent leisure participation, are well documented. For instance, structured extracurricular activities are not available in many communities and are most accessible to white, middle-class, American adolescents (Mahoney et al., 2005).

Quality of Experience and Leisure Motivation

If individuals pursue free time activities they truly enjoy, they are believed to be intrinsically motivated. Scholars distinguish between activities that bring hedonic enjoyment (i.e., pleasure and relaxation; typical activities are socializing and watching movies) and those that bring eudaimonic enjoyment (i.e., self-expression and personal growth; typical activities are volunteering, sports, and performing arts). Although both types of activities are needed to live a 'full life,' individuals differ in how much value they place on hedonic and eudaimonic enjoyment. Mihály Csíkszentmihályi and colleagues conducted landmark research on flow experiences (i.e., a match between a high challenge of the activity and a high skill of the performer, which generates the feelings of intense involvement, alertness, and happiness). These studies showed that some people are more likely than others to seek out such activities and to experience flow ('autotelic personality').

However, individuals sometimes perform free time activities they do not enjoy much. For instance, many common leisure activities, such as watching TV, are associated with rather negative emotional states (apathy). Edward Deci and Richard Ryan's self-determination theory (SDT) helps understand how individuals become involved in unenjoyable activities. According to SDT, wherever people are not intrinsically motivated, they may still perform an activity for a variety of extrinsic reasons. SDT describes four levels of goal internalization ranging from purely external control by others to integrated regulation, where an individual voluntarily pursues the activity and recognizes it as important to the self. Finally, individuals may perform an activity for no particular reasons (amotivation).

According to SDT, both extrinsically motivated and amotivated behaviors may occur when individuals' basic psychological needs for autonomy, competence, and relatedness are thwarted; such activities are usually experienced as boring or too demanding. For instance, the evaluative and competitive aspects of sports participation may undermine some individuals' intrinsic enjoyment of sports and exercise, leading to dropout among many adolescents. In contrast, coaches who support autonomy (i.e., give freedom of choice and focus on mastery instead of competition) can facilitate the participants' intrinsic motivation for sports and continued involvement. Although adolescents may become involved in a given activity, such as community service, for extrinsic reasons (e.g., pressure from parents or peers), under the right conditions (i.e., if participation in the activity satisfies their psychological needs), they may recognize the importance of this activity for themselves or even discover intrinsic enjoyment in it.

Some, but not all, adolescents seem to be especially prone to boredom (Hunter and Csikszentmihalyi, 2003). Complaints of being bored, both at school and in free time, can become more frequent as young people progress from early to late adolescence. As predicted by SDT, boredom is associated with feelings of controlled motivation (based on poorly internalized goals) and amotivation. As adolescence is the period when individuals should begin to exercise more autonomy in their daily life, chronic boredom in the context of leisure may signal that this developmental task is not being supported. Researchers have offered several explanations for adolescent amotivation and boredom, including excessive adult control and a lack of skills to organize one's leisure activities in a satisfying and productive way. It appears that adolescents still need a lot of support from adults in organizing their leisure (e.g., structured activities are typically experienced as interesting), but this support should be provided in an unobtrusive way so that the need for autonomy is not thwarted. Although cultures differ in the amount of autonomy granted to adolescents by their parents, the basic link between autonomy in activity choices and activity enjoyment has been replicated across cultures.

Drawing on SDT, Robert Vallerand and colleagues distinguished between harmonious and obsessive passion for activities. Passion is opposite to amotivation and is characterized by high investment, valuing, and liking of the activity. Whereas harmoniously passionate individuals feel free to perform or not to perform their favorite activity, those obsessively passionate often feel urged or obliged to perform the activity, which entails less enjoyment and a rigid persistence in pursuing it. Both types of passion develop over time if individuals invest much time and effort in a given activity, highly value it, and strongly identify with it. Furthermore, harmonious passion is more likely to develop in the context of autonomy support, whereas obsessive passion emerges in a controlling context where there is little freedom of choice and approval by others depends on persistence and performance. Children's and parents' beliefs that one should give up on other pursuits in order to excel in a chosen activity also foster the development of obsessive rather than harmonious passion (Mageau et al., 2009).

Expectancies for Success and Leisure Motivation

Participation in achievement-related and skill-based types of leisure, such as sports, artistic activities, and career volunteering, is especially contingent on one's expectations to succeed. In his social cognitive theory of motivation, Albert Bandura distinguished between two kinds of expectancies: outcome expectations (beliefs that certain behaviors can lead to desired outcomes) and self-efficacy beliefs (individuals' judgments concerning their ability to organize and perform a given behavior to produce a given outcome, even in the presence of obstacles). Self-efficacy beliefs are based on one's own past experiences, on the feedback received from others, and on the observations of others' successes or failures on similar tasks. In the leisure context, higher self-efficacy regarding sports and physical activity is related to higher physical activity involvement among adolescents and moderates the negative effects of

other factors, such as perceived low accessibility of recreational facilities. High self-efficacy is also required to abstain from unhealthy leisure choices, for instance, higher self-efficacy in resisting peer pressure is related to a lower likelihood of substance abuse in adolescence.

An integrative model of achievement-related motivation and its developmental precursors was suggested by Jacquelynne Eccles and colleagues. In their expectancy–value model, activity choices are predicted by expectancies for success and subjective task value, which combines intrinsic enjoyment of the activity with its subjective utility, its centrality to one's identity and core goals, and cost. Further, through a chain of psychological and social mediators, expectancy–value beliefs are shaped by past experiences and by beliefs and behaviors of socializing agents (e.g., parents), who are themselves influenced by a broader socioeconomic and cultural context.

To take an example, because of gender role stereotypes, parents recognize and foster athletic aptitudes in their sons more readily than in their daughters, and in this way girls grow to be less confident about their athletic performance and less interested in sports activities. Furthermore, several studies (e.g., Simpkins et al., 2012) showed that parental beliefs and behaviors are even stronger predictors of children's and adolescents' skill-based leisure activities, such as sports, instrumental music, and out-of-school computer activities, than of their academic activities, probably because the former are not as well incorporated into the school curriculum and require more parental inputs. Children's and adolescents' own expectancies for success and task values predict such leisure activities. Findings from longitudinal studies suggest that both expectancies for success and subjective task values in achievement-related activities, such as sports, decline steadily from childhood through adolescence, in part because achievement-related leisure becomes increasingly competitive as children grow up. As denied entry onto a team is likely to be experienced as a personal failure, rejected adolescents downgrade the importance of such leisure pursuits and drop out of such competitive activities. Thus, the expectancy–value model concurs with SDT in that the attitudes and behaviors of socializing agents and the framing of structured activities (e.g., as competitive or collaborative) are important determinants of adolescents' leisure motivation.

Personality and Leisure

Although situations and contexts are important determinants of leisure motivation, stable individual differences in leisure preferences also exist. First, individuals differ in the content of activities that appeal to them. The very definitions of some personality traits include preferences for leisure activities. Unsurprisingly, extroverted individuals prefer social activities and, to a lesser extent, sports, whereas introverted individuals are more drawn toward the arts. High openness to experience is related to the preference for artistic and cultural activities. High neuroticism is an obstacle to leisure participation and enjoyment in general, but especially with regard to competitive sports, which require high emotional stability. High sensation seeking is associated with a range of leisure activities, such as adventurous and dangerous sports, outdoor activities, and illegal leisure (e.g., drug use and drunk driving). Boredom proneness is related to sensation seeking, which explains why frequent boredom forebodes the involvement in risky behaviors, particularly among adolescents. In contrast, a resilient and prosocial personality predicts involvement in volunteering and community service. Finally, specific individual abilities predict engagement in corresponding aptitude-based activities, such as sports, playing music, and intellectual activities; accordingly, such leisure pursuits also yield relatively high heritability estimates.

Second, individuals differ in their ability to experience intrinsic enjoyment of leisure and in the type of enjoyment they look for (hedonic vs eudaimonic). By adolescence, the striking difference between chronically interested and chronically bored individuals becomes apparent. Interested adolescents report higher and more stable self-esteem, a more internal locus of control, and greater optimism than their bored counterparts (Hunter and Csikszentmihalyi, 2003). In adults, proneness for flow is related to high conscientiousness and low neuroticism. Although temperamental bases of motivational orientations may exist, socializing influences are also key. For example, authoritative parenting and parental role modeling in childhood predict flow experiences and eudaimonic versus hedonic pursuits in adolescents and young adults (Huta, 2012).

Assessing Leisure Preferences and Participation in Adolescence

Methods of assessing adolescent leisure participation or nonparticipation differ depending on the research purpose. In particular, behavioral indicators capture what adolescents actually do in their free time, measures of leisure preferences or interests reflect what they would like to do, measures of constraints to participation investigate why they are not involved in a given leisure activity, and measures of underlying motivation reveal why they do what they do. Behavioral indicators are usually time-use data collected through survey questions (i.e., respondents estimate how much time they typically spend on a given activity), time diaries (i.e., over the course of several days, respondents note what they are doing or recall what they were doing on the previous day), or experience sampling techniques (i.e., for a number of days, respondents receive random signals from a mobile device prompting them to note immediately what they have been doing).

Measures of leisure preferences typically sample a wide range of leisure activities and ask adolescents to rate their liking/disliking of them, similarly to vocational interest scales. For example, Hansen's 250-item Leisure Interest Questionnaire consists of 20 scales, such as travel, culinary pursuits, and computer activities, and can be administered to late adolescents. King et al.'s Preferences for Activities in Children scale is a shorter instrument designed for children and adolescents with disabilities, which consists of 55 items divided into two activity domains (formal and informal) and five activity types (recreational, active physical, social, skill-based, and self-improvement). It complements another instrument measuring actual participation, Children's Assessment of Participation and Enjoyment; both are applicable to individuals without disabilities.

Measures of perceived constraints to leisure are based on Crawford et al.'s hierarchical model and assess intrapersonal, interpersonal, and structural constraints. Instruments assessing leisure motivation are usually tailored to specific theories of motivation. For instance, the 20-item Free Time Motivation Scale for Adolescents draws on SDT to assess five types of motivation ranging from amotivation to intrinsic motivation. The Passion Scale adapted for children and adolescents consists of 11 items and is used to distinguish between harmonious and obsessive passion for activities. Expectancy–value scales based on Eccles et al.'s theory measure expectancies for success and task values associated with specific achievement-based activities. Finally, qualitative methods for the assessment of leisure participation and motivation, such as focus groups, are also increasingly used.

Consequences of Leisure and Ways to Intervene

What adolescents do in their free time has short- and long-term implications for their health and psychosocial development. Participation in high-quality structured after-school programs is often enjoyable, predicts higher academic success, and provides developmental experiences in a variety of domains, such as identity work, initiative, emotional regulation, teamwork and social skills, positive relationships, and social capital (Feldman Farb and Matjasko, 2012; Mahoney et al., 2005). Programs where adults provide indirect guidance and adolescents feel in control of their activities facilitate the development of agency skills, for instance, strategic thinking. However, not all structured programs are of high quality, and involvement in low-quality programs may engender negative experiences leading to dropout, which should not be considered a negative outcome in this case (Rose-Krasnor, 2009). In turn, unstructured and unsupervised peer time, which is a leisure option highly attractive to Western adolescents, provides opportunities for self-exploration, autonomy development, and development of social competence, but also carries risks, such as substance use, unprotected sex, and delinquency. That is, just like structured activities, unsupervised peer interactions may be of different quality. Likewise, media-based leisure pursuits, such as watching TV, Internet surfing, and playing video games, may have both positive and negative effects on health and development depending on their particular content and the amount of time devoted to them.

Numerous programs have been developed to prevent risky behaviors in adolescence, such as substance use and unprotected sex, but few have focused on promoting healthy, developmentally beneficial choices and behaviors in the context of free time. A noteworthy exception is the TimeWise program developed by Linda Caldwell and colleagues (Caldwell et al., 2004), which aims at fostering general leisure skills and optimal motivation. TimeWise is partly based on SDT, consists of six curricular lessons delivered in Grade 7 classrooms in the US, and has already yielded positive short-term effects. Recently, it has been applied in South Africa as part of a larger prevention program.

Yet another approach to intervening with adolescents' leisure is to encourage their participation in specific desirable activities, most commonly sports and physical exercise. School-based interventions to promote physical activity among adolescents have rather short-term effects (to produce sustained effects, an intervention should last at least several months) and have limited generalizability to leisure contexts. More comprehensive interventions, for instance, those involving parents, tend to be more effective.

Conclusion

Adolescent leisure choices are influenced by a multitude of factors, many of which, such as structural facilities, financial constraints, and the attitudes of socializing agents (e.g., parents, teachers, and peers), adolescents cannot control. Nevertheless, to benefit from leisure experiences, adolescents need to exercise control – to be free to choose and plan their leisure, to balance different types of leisure activities, and to refrain from risky leisure pursuits. This requires organization and self-regulation skills as well as the ability to enjoy leisure. Where such skills and abilities are lacking, it is not the fault of adolescents themselves but rather the indication that their socializing agents lack these same skills and abilities or do not create a supportive and challenging environment optimal for psychosocial development. Future researchers would therefore be well advised to develop comprehensive interventions fostering leisure skills and optimal leisure experiences in children and adolescents, for example, by including corresponding components in family and community intervention programs.

Leisure and Cultural Consumption: The European Perspective

Abstract

Leisure and cultural consumption are today considered key components in a person's – or a nation's – quality of life. Despite the historic decline in the hours spent at paid labor, current trends in leisure time are unclear. Recent developments suggest a possible halt in the road toward the leisure society and a reversal of the leisure/status gradient. However, the sheer availability of leisure time is not the whole story. Scarcity in leisure time can be offset by a more intensive use of it. As discussed in this article, such use relies on financial and cultural resources which are associated with education and, to some extent, with nationality

Leisure is increasingly considered a key component of quality of life (Stiglitz et al., 2010). Leisure is classically defined as "all activities that we cannot pay somebody else to do for us and we do not really have to do at all if we do not wish to" (Burda et al., 2007: p. 1). In other words, leisure corresponds to the portion of time freed from the necessity of labor, whether paid or unpaid. Looked at this way, leisure is equivalent to resting time. But this very general perspective fails to grasp some of leisure's qualitative aspects: How people spend their free time matters, too. Therefore, researchers interested in leisure usually focus on specific topics such as sport or cultural participation.

Hereafter, leisure is thus chiefly considered in relation to cultural participation and consumption. Leisure and cultural consumption are also considered from the perspective of social inequalities in access to recreational and cultural facilities. Because many European countries devote a significant amount of public funding to culture, cultural participation is also a public policy issue. And the main concern of policy makers in that domain is precisely to ensure fair access to cultural and recreational goods.

General Trends

Trends in leisure and cultural participation can be studied in various ways. First, one can rely on expenditure data. But expenditure alone can be misleading insofar as it reduces the value of leisure activities to their market price and conceals all recreational and cultural activities that do not entail any market transaction. In addition, as the data on expenditure mainly relate to households, they cannot assess individual practices. For these reasons, it is necessary to supplement expenditure data with information on the amount of time people spend on leisure and recreational activities and with data on cultural participation.

Trends in Cultural and Recreational Expenditures

Cultural and recreational expenditures consist of a wide variety of goods and services: books, newspapers, cinema, museums; TV and radio taxes; goods used in amateur activities, such as drawing materials and musical instruments; audiovisual, photographic, and information processing equipment; games and toys; plants and flowers; package holidays; pets and related products. In 2005, cultural and recreational expenditure accounted on average for approximately 9% of total household expenditure in 27 European countries, ranging from 3% in Bulgaria to 13% in Sweden (see **Figure 1**).

The ranking of European countries displays a clear South/North gradient and, to a lesser extent, an East/West one. A first group of countries, where the share of cultural and recreational expenditure accounts for more than 10% of total expenditure of households, includes all Scandinavian countries together with Finland, Germany, the Czech Republic, the Netherlands, and the United Kingdom. In contrast, cultural and recreational expenditures account for less than 5% of household expenditure in Lithuania, Romania, Greece, and Bulgaria. Variations across countries reflect differences in wealth, price structures, and availability of cultural and recreational amenities. Availability, in turn, is partly dependent on the level of public funding for leisure and cultural infrastructures.

But these disparities also reveal variations in intrinsic preference for leisure. This is shown in **Figure 2**, which plots household total expenditure against share of cultural and recreational expenditure in this total. The crossing of these two dimensions defines four groups of countries. The first consists of ones where both household total expenditure and share of the recreational and cultural expenses are above the EU27 mean: Belgium, Germany, Ireland, Malta, Austria, the Netherlands, and the United Kingdom. All of them are quite wealthy countries, supporting the idea that the share of total expenditure devoted to leisure and culture is primarily linked to earnings and wealth. A second group – Bulgaria, Lithuania, Romania, Estonia, Slovakia, Latvia, Poland, Hungary, and Portugal – consists of countries where both household total expenditure and share of the recreational and cultural expenses are below the EU27 mean. As these countries are on the whole poorer than those of the first group, this second configuration also supports the hypothesis that cultural and recreational expenditure share is mainly due to global wealth.

The other two groups are not completely supportive of this pure wealth effect, however. The third group, reduced to one country – the Czech Republic – is characterized by the highly improbable combination of above-average share of leisure and total expenditure below the European mean. Interestingly, the final group consists of countries where a high level of

Figure 1 Share of recreation and culture in households expenditures in 2005 in EU27. Source: Eurostat, Household Budget Survey 2005.

Figure 2 Total household expenditure and share of cultural and recreational expenditure in 2005 – EU27. Note: households final consumption expenditure is measured in pps (purchasing power standard) Source: Eurostat, Household Budget Survey 2005.

household expenditure coexists with a rather low share dedicated to culture and leisure: France, Spain, Italy, Greece, Cyprus, and Luxembourg. These two configurations, especially the latter, illustrate the limits of cross-national comparisons in cultural and recreational expenditure. To the extent that a substantial part of cultural and recreational amenities, although highly variable from one country to another, is publicly funded, cross-national comparisons are biased by the coexistence of market and nonmarket goods. In that sense, a relatively low level of private cultural and recreational expenditure is not necessarily synonymous with a small commitment to culture. For this reason, the household expenditure approach must be supplemented by leisure time budget and cultural participation statistics.

Trends in Leisure Time

Technically speaking, leisure might be considered 'residual time': the time remaining after paid and unpaid work (household chores), child and personal care have been subtracted from the total amount of waking time per day. According to this criterion, however, many activities are ambiguous. Is the time devoted to reading stories to a child a matter of leisure or a matter of child care? Is time devoted to cook a meal for friends a matter of domestic chores or recreational time? To what extent can the time devoted to repairing a car, decorating a house, or doing arts and crafts at home be included in leisure time?

To explicitly take into account the ambiguous nature of such activities, they are sometimes labeled 'semi-leisure' activities. Relying on this extended notion of leisure time, three major tendencies can be highlighted in Europe in recent decades: (1) a slight decrease in time devoted to leisure, at least in some countries; (2) an increasing variability of the distribution of time allocated to leisure; and (3) a strong heterogeneity in the cultural contents of leisure.

A Pause on the Road toward the 'Leisure Society'

At the beginning of the 1960s, the French sociologist Joffre Dumazedier prophesied the coming of a 'leisure society' (Dumazedier, 1962). From the end of the nineteenth century to the third-quarter of the twentieth century, the continuous decline in the number of hours of paid work observed in many Western countries supported Dumazedier's prediction. Since the late 1970s, however, in many countries, the trend has not continued (Zuzanek et al., 1998; Gershuny, 2000; Chenu and Herpin, 2002). Since then, European countries have followed slightly different trends. In some (e.g., Sweden and the United Kingdom), the annual number of paid work hours started to increase at the beginning of the 1980s, whereas in others (e.g., Denmark and, to a lesser extent, France), this reversal occurred later and was less pronounced (**Figure 3**).

The same holds true when leisure is defined as the time that remains after subtracting paid and unpaid work. Since the end of the 1970s, countries such as Norway, the Netherlands, and France experienced a significant decline in the leisure time of men. The same is true for women in Norway, the Netherlands, and the United Kingdom (Gimenez-Nadal and Sevilla, 2012). As argued by Gershuny (2009), the work/leisure balance has evolved differently for men and women. In nearly all countries, men experienced an increase in the proportion of unpaid relative to paid work, whereas the opposite was true for women. Changes in leisure time may reflect these shifts between paid and unpaid labor. Furthermore, the average amount of leisure time is highly variable form one country to another. According to the Eurostat Time Use Survey, leisure time in 2000 varied from a minimum of 4:13 a day in Lithuania to a maximum of 5:46 in Norway (**Figure 4**).

According to Gershuny (2009), this trend (which of course may be only temporary) might reflect a deeper change in the social meaning of leisure. In the industrial society, leisure was the privilege of the dominant classes who owned the means of production and exploited the workforce of nonowners. At that time, as asserted by Veblen (1899) in his leisure class theory, idleness was a correlate of wealth. But the emulation principle that governed social dynamics made leisure universally desirable: People tried to emulate the lifestyle of those just above them in the hierarchy of social prestige and power. Combined with the labor productivity gains that went along with the development of capital accumulation during the first three-quarters of the twentieth century, this emulation principle led to the observed decline in the duration of paid work and the associated increase in leisure time.

In contemporary Western countries, however, it is not clear whether these social dynamics are still in play. Modern capitalist companies increasingly separate ownership and management. The upshot is that for the dominant social classes, human capital has become more important than

Figure 3 Annual hours worked by the total employed population in selected OECD countries. Source: OECD, Employment Outlook 2006.

Figure 4 Leisure time in 2000 in 14 European countries. Source: Eurostat, Time Use Survey 2000.

capital as such. Income and power increasingly derive not from ownership of capital (e.g., factories) but from highly qualified, highly paid jobs (Gershuny, 2009). In short, people at the top are working longer hours, thereby realizing the counter-prophecy of a harried dominant class (Linder, 1970). The trends in leisure inequalities noted above are partially supportive of this scenario.

The Reversal of the Leisure/Status Gradient

Another meaningful evolution observed in recent decades in the West in general, and in Europe in particular, is the increasingly unequal distribution of leisure since the 1970s (Gimenez-Nadal and Sevilla, 2012). This increase in leisure inequality is closely but negatively linked to the increasing inequality in earnings that occurred in the same period. Indeed, those who have benefited the most from the former are those who have suffered the most from the latter. In an increasingly knowledge-based economy, high earnings predominantly accrue to the most educated people. In other words, high incomes function as an incentive to increase the amount of paid work and reduce leisure time. By contrast, less-educated people work fewer hours, earn less, and have more leisure time (Gimenez-Nadal and Sevilla, 2012). This results in a reversal of the leisure/status gradient: whereas in the past the wealthiest people had more leisure time than others, now they have less (Gershuny, 2009).

This is not to say, though, that increased leisure time for the less wealthy is adequate compensation for their economic downgrading. One could argue that the wealthiest and most educated people compensate for the scarcity of their leisure time by using it intensively, made possible by the economic and cultural resources available to them (Coulangeon et al., 2002; Degenne et al., 2002; Gronau and Hamermesh, 2008).

It might also be noted that leisure time in Europe is highly gendered. As shown in **Figure 5**, across Europe men have more leisure than women (about 38 min more on average). The cross-national variations display a rather clear north/south and west/east gradient. Gender differences are minimal in Norway (4 min) and maximal in Poland (56 min) and Italy (79 min).

The Cultural Paradox of Free Time

Inequality in leisure is not exclusively a matter of quantity; it is also – and primarily – a matter of quality. In other words, what people do with their free time, whatever its amount, matters. This can be illustrated by the total time spent on TV and TV as share of total leisure time according to level of education. As

Figure 5 Gender differences (minutes per day) in leisure time, showing more leisure time for men, 2006. Source: OECD estimates, based on national and multinational time use surveys.

shown in Table 1, the average daily time devoted to TV ranges from 1:49 in Germany to 2:27 in Bulgaria. Across all nine countries shown in Table 1, TV accounts for roughly 40–60% of total leisure time, ranging from 39% in Spain to 58% in Bulgaria.

With the exception of Slovenia and Bulgaria, daily time devoted to TV is negatively related to level of education. This negative relation is particularly strong in the United Kingdom and France, where the least educated watched TV for 1:15 and 1:20, respectively, more than the most educated. In these countries especially, TV watching appears as a particularly illegitimate practice for the culturally well-to-do (Lahire, 2004).

It is also noticeable that in all countries time spent on reading increases with education (Table 2). More generally, it has been shown elsewhere that TV watching is the only cultural practice whose intensity is negatively correlated with all other cultural practices (Coulangeon and Lemel, 2009).

In the nine countries shown in Table 2, daily reading time ranges from 15 min in Spain to 46 min in Finland. Time devoted to reading is strongly and positively related to education. But even among the most educated people of the most reading countries, such as Finland or Estonia, reading never represents more than 19% of total leisure time.

More generally, it can be demonstrated that the cultural content of leisure time tends to be negatively correlated with quantity. On average, people who have the most leisure time have the fewest number of cultural practices (Coulangeon et al., 2002). Among the most educated people and among the upper classes, intensity and efficiency of the use of time seems to partially compensate for its relative scarcity. In that sense, access to more active and culturally intensive practices seems to be a matter of financial and cognitive resources rather than a matter of time as such. Furthermore, many recreational practices take place over a longer timescale that cannot be adequately grasped on a daily

basis. For this reason, beyond the time–budget approach, data on cultural and recreational practices may provide further insight.

Trends in Cultural Participation

Cultural facilities have different rates of attendance. As shown in Figure 6, about 50% of Europeans visit historical sites or attend the cinema at least once a year, whereas other cultural facilities are less frequently attended.

Figure 6 Attendance at cultural facilities, EU27, 2013. Note: proportion of respondents who have been at least one time in each of the facilities in the year preceding the survey. Source :Eurostat, Eurobarometer 79.2, 2013.

Beyond this general statement, cross-national comparison displays huge discrepancies across Europe. For example, on average 18.5% of Europeans attend a ballet, dance performance, or opera at least once a year, but, as shown in Table 3, the rate varies from 7.5% in Portugal to 34.3% in Sweden.

Again, western and northern European countries differ from eastern and southern ones. One might suspect that these variations may be due to differences in the availability of cultural facilities, which is itself highly dependent on degree of urbanization. However, as Table 3 shows, when the data are examined separately for rural area, middle town and large town, the ranking of the countries remains much the same. Differences between countries are not reducible to their level of urbanization, therefore, but reflect dissimilarities in global wealth and supply of cultural amenities. In that sense, it is particularly noticeable that, except for Estonia, the countries where the contrast between rural and urban areas is the strongest (as shown by the odds ratio in the right-hand column) are also those with the smallest rate of attendance overall.

The contrasts between European nations remain consistent when we turn to more common cultural practices, such as movie going (Table 4). The ranking is similar, as is the

Table 3 Ballet, dance performance, or opera attendance, 2013

contrast between western and northern Europe, on the one hand, and southern and eastern Europe, on the other. The most significant exceptions are Estonia and Latvia, which rank much higher on ballet, dance performance, or opera than on cinema. In addition, the differences between urban and rural areas are much smaller for cinema than for ballet, dance, and opera.

All in all, cross-national differences in access to cultural amenities are quite similar in the realm of mass culture and in the elite culture domain. Differences between countries appear to be more a matter of global affluence than cultural legitimacy, in Bourdieu's sense of the notion (Bourdieu, 1984[1979]).

Across Europe, access to cultural facilities displays huge inequalities with respect to social class, education, age, and gender. Relative to other groups, professionals display a higher commitment to cultural participation, as shown by the values of the cultural participation index reproduced in Table 5. The countries' ranking on this index is consistent with previous results, contrasting once again the same subgroups. It is also again noticeable that the relative distance between groups, as measured by the ratio of the professionals' score to the manual workers' score, is highest in countries with the lowest average scores, such as Portugal and Hungary, and lowest in countries with the highest average scores, such as Sweden, Finland, and Denmark. These three last countries are also known to be more egalitarian in many other respects (income, wealth, health, education). The variations in the magnitude of the between-group differences in cultural participation thus suggest that culture is a stronger social marker in unequal societies than in more egalitarian ones (Hjellbrekke and Korsnes, 2014). These variations might also be due to the impact of educational and cultural policies.

Finally, it is worth noting that the cultural participation scores of the professionals are much more homogeneous across nations than the scores of other groups, as shown by the relative standard deviations in the bottom row of Table 5. Note that these values are lowest for the professionals, highest for farmers and fisherman, and twice as high for manual workers than for professionals. European elites appear more culturally homogeneous than the rest of the population.

Summary and Conclusions

Regarding leisure and cultural consumption in Europe, three main tendencies deserve to be underlined. First, time budget surveys suggest a possible halt on the road toward the so-called leisure society. Second, and as shown repeatedly in this article, variations in leisure and cultural consumption vary significantly from one country to another. Third, leisure time remains subjected to significant inequalities, especially in terms of class, education, and gender. The pattern of inequalities is, however, complex. On average, the most advantaged in leisure time are the most disadvantaged in economic, educational, and cultural resources. As demonstrated by Marie Jahoda, Paul F. Lazarsfeld, and Hans Zeisel about the Marienthal unemployed (Jahoda et al., 1971[1932]) – and dramatically illustrated today in some European countries grappling with massive unemployment – overabundant free time is not necessarily synonymous with true leisure. Leisure time cannot be an end in itself if people cannot afford to enjoy it.

Abstract

Leisure is classically defined as 'freedom from the necessity of labor' – a state of mind that is distinguished from free time, which can be quantified using time diaries. US national time-diary figures over the last 50 years show declines in the hours spent at paid and unpaid work for those aged 18–64, leading to about 38.5 h a week of free time for activities like socializing, fitness activity, and mass media use. Almost half of this free time is devoted to television, suggesting Americans are unprepared to use this important resource wisely. Reinforcing these concerns are arts participation surveys showing a recent decline in these activities, which take up less than 1% of free time. Social class differences implicit in Veblen's 'leisure class' may be reversing, although signs of 'conspicuous consumption' clearly remain. More positive subjective indicators indicate no increases in Americans feeling rushed, being fatigued, or feeling unhappy. Nonetheless, there remains the need to develop more sensitive indicators of the quality of American leisure.

Most definitions of leisure treat it as activity (or inactivity) opposite to or the counterpoint of work. Leisure can be considered as a reward for work, as the purpose for work, or as 're-creation' to recover from work. In a postmodern society in which opposites are increasingly blended, we see attempts by individuals and institutions both to make their work more leisurely (e.g., taking yoga or exercise breaks, celebrating birthdays) and to make leisure more work-like. Thus, in their work time, people dress more casually, take sabbaticals, or attend retreats; while in their 'harried leisure' away from work they 'work out', act as purchasing agents for their households, carry online devices into the wilderness or master new work skills.

A classic definition of leisure speaks of it as 'freedom from the necessity of labor'. In the economic sense of that definition, America has become a leisure society *par excellence*, with unprecedented proportions of its retired citizens no longer needing to earn money from their work labors to obtain adequate provisions of food, clothing, and shelter (not to deny the significant minorities who remain below the poverty line and need to work to make ends meet).

Free Time vs Leisure

One political philosopher who foresaw many of these developments was Sebastian de Grazia (1962), who lamented how capitalistic democracies had overcome the 'tyranny of man' only to submit to the 'tyranny of the clock' (as exemplified by the gift of gold watches to retiring employees who least needed them). DeGrazia made a sharp distinction between free time, which can be quantified, and leisure, which cannot. In ancient societies, he saw the purest form of leisure emerging when individuals pursued activities (contemplation, composing music or poetry) from a personal sense of commitment, quality, and fulfillment. In modern capitalistic societies, DeGrazia considered such leisure as almost invisible, even as free time has continued to increase.

Perhaps the closest modern equivalent to classic leisure is evident in Csikszentmihalyi's (1990) studies of 'flow', except that here individuals seek optimal experience and joy in more active pursuits, like skydiving or extreme sports. Two ironic features of flow episodes are that (1) the sense of time in a time-oriented society largely disappears and (2) most flow episodes he cites occur during work hours rather than free time. Like leisure, flow remains unquantified, since it is not clear in time-use studies when such profound cultural experiences occur.

Measurement of Work and Free Time

Until the last decades, most measures of work and free time have been based on reductions from survey 'estimates' made by workers of their work hours (e.g., "How many hours did you work last week?"), rather than on more detailed accounts that use on-site observation, electronic pagers, or time diaries. The great value of these diary accounts is that workers report on *all* their daily activities, and not just their work time. In accounting for time in time diaries, for example, respondents are less prone to problems of memory loss, self-projection, and double counting of time than when they make time estimates.

The surprising implication from the detailed diary data in Figure 1, then, is that Americans during their prime working years (ages 18–64) now have slightly more free time than in the 1950s or 1960s (Robinson, 2009; Aguiar and Hurst, 2009).

To some extent, that increased free time has come about because of demographic or structural changes in the workforce, in that today's workers:

1. enter the workforce later in life, as they receive more years of college education;
2. may retire or work a reduced schedule at age 62 or earlier;
3. live longer and thus can enjoy more free time during their retirement years.

The end result is that, when aggregated across a person's lifetime, their free time hours will notably outweigh their time at the work (Ausubel and Grubler, 1994). Nonetheless, there remains the question of why Americans continue to work more hours than they need to, and whether they are incapable of appreciating

Figure 1 1965–2012 Time-diary trends in weekly hours of free time (age 18–64). Robinson, J., Godbey, G., 1999. Time for Life. Penn State Press, State College, PA; ATUS-X.

leisure, as Reisman (1958) and de Grazia (1962) worried a half-century ago. The finding that more than 60% of the free time of retired people goes to watching TV provides further reinforcement for their concern (Robinson and Caporaso, 2009).

Similar arguments arise from examination of the free-time activities reported by Americans during the hours they are not working. As shown in **Figure 1**, close to 45% of US free time is spent watching TV content that is generally *undemanding* and/or uncritical of material lifestyles or environmental degradation. **Figure 1** shows that their 16+ television hours per week dwarf the combined 3–4 h spent reading, being online, or using other media. Further concern has arisen over the decreased time spent on 'social capital' free-time activities that provide the important social 'glue' that allows societies to flourish (Putnam, 2000). Perhaps the most optimistic trend in these diary accounts is that fitness activity has more than doubled since the 1960s (as part of other 'healthier' life-style changes, such as decreased smoking or red meat consumption).

The dominance of TV in free time is often taken as a sign of a waste of this precious resource by social critics (Mander, 1977; Postman, 1987), or as reducing participation in social capital activities (Putnam, 2000). Viewers themselves rate TV as unchallenging and boring in relation to other daily activities (Kubey and Czikszentmihalyi, 1991) as unenjoyable 'in general' and as the first activity they would give up if more urgent daily needs came up (Robinson and Godbey, 1999). However, these respondents rate TV much more positively in their 'real-time' diaries than in general (Robinson and Martin, 2008, 2009). Moreover, it has been argued that its content has become more sophisticated and challenging in recent years (Johnson, 2004), the greater viewing of serious programs like *60 Minutes* and cable TV movies is further evidence that TV can be an uplifting cultural experience.

Demographic Correlates of Free Time

Who, then, has more of the resource of free time, which at least affords the opportunity of leisure?

Gender

While diary studies through 1995 showed American women aged 18–64 generally equal with men in their free time, studies since then show women with 3–5 h less free time than men, with employed women having about 4 h less than employed men and more than 10 h less than nonemployed women. Thus this gender inequality has been increasing over time, unlike the more equal gender reported by Goldschmidt-Claremont and Pagnossin-Aligisakis (1992).

Age

As might be expected, free time is U-shaped across the lifecycle, reaching more than 40 h a week for teens and young adults, dropping to 30 h or less for those adults raising families during the peak career years of their 30s and 40s, then rising to 40 h again in the 'empty nest' years – and approaching 50 h in their retirement years past age 55.

The main reason for this curve is not age per se but the various role obligations that peak in middle age – namely work, marriage, and children. The more hours of work, obviously the less free time; however, as noted above, there is far from a 1:1 correspondence. Moreover, workers who put in long hours are actually more active in the arts, in fitness activity, in civic participation, and in sexual activity (Robinson and Godbey, 1999; Putnam, 2000). Getting married usually means less free time as well, as does having children, so that married women with children have up to 10 h less free time a week than single childless women of equivalent work status.

Status

While social status may be a powerful predictor of one's power and resources to access more sophisticated forms of leisure, it has recently become associated with having less free time to enjoy such pursuits. That is because more of them are employed and those who work do work longer hours. In addition there is the greater enjoyment of work (and other leisurely features) among higher status workers,

and the need for lower status workers to work longer hours to offset their lower wages. The rich 'leisure class' of which Veblen (1899) wrote so critically over a century ago seems to have given way to rich people who work 80–90 h workweeks today. Indeed, working long hours has become something of a status symbol in its own right (Mack, 2005; Gershuny, 2009), and Hochschild (1997) has documented how certain workers can treat work as a consumption activity.

Ecological Factors

Surprisingly little difference in free time can be found by region, and in (presumably less hectic) rural areas; nor are many notable differences found in different seasons of the year.

International Comparisons

The conclusions drawn above refer mainly to studies conducted in the USA. Many of them, however, are replicated in other Western societies. Using data from the 30+ country archive of time-diary studies at the University of Oxford, for example, Gershuny (2009) found average cross-national gains in free time since the 1960s, much as Bittman (1998) found earlier. These gains largely mirrored those reported by Robinson and Godbey (1999) and by Aguiar and Hurst (2009) for the US. Also as in the US, Gershuny found more work hours for the higher status respondents across time, as work hours for the working class declined. This led to a scenario he described as "Veblen in Reverse" in that the former 'leisure class' were working longer hours as their new badge of honor. Again, the extent that such workers experience more leisure or pleasure during that work time suggests the need for more qualitative research.

These combined multinational free-time figures for 23 European and other mainly Western countries are shown in **Table 1** from Fisher and Robinson (2011). Here, average TV viewing times in other countries (mainly 10–14 h per week) can be seen as 2–8 h lower than in the US, even while they have about the same amount (35–40 h) of total free time. In percentage of free time availability, the US 44% figure in the last column of **Table 1** can be seen as notably higher than in most Western European countries (where it tends to be less than 30%, dipping to less than 20% in Holland). It is close the rates in Bulgaria, Japan, and the Baltic countries, although residents of these countries tend to have less free time available to watch.

Cultural Consumption

Arts Participation

Table 2 summarizes recent trends from a set of US benchmark data on 'higher culture' or 'cultural uplifting' free-time events that has been monitored regularly since 1982 by the Survey of the Public's Participation in the Arts (SPPA), conducted by the National Endowment for the Arts. It can be seen that in 2012 the proportions attending these arts events in the previous year varied from 2% for opera to 15% for musical theater, but that that attendance for each of them has declined since 1992. There are wide social status differences in attending these SPPA arts events, with those of higher education and income being up to five times or more likely to attend one of these benchmark events than those of lower education and income (with

Source: Survey of Public Participation in the Arts (SPPA, 2012).

education by far being the greater predictor). However, these recent notable *declines* in arts participation occurred despite the dramatic increase in public general education levels (Robinson, 2012). As summarized at the bottom of Table 2 (and the middle of Figure 2 below), the proportion attending any of these benchmark arts events declined from 41 in 1992 to 33% in 2012, and that is further reflected in parallel declines in attending art museums and reading serious forms of literature, like novels or poetry.

The 2012 figures on the right of Table 2 show that these arts participation levels in live attendance can be matched or exceeded by including arts exposure via radio or TV, the Internet or other new media. That reflects how these arts activities continue to be engaged in far more as spectators than as performers/producers (although the 1997 SPPA found more than 8% of American adults personally playing or singing music at home, but only about 1% in a public performance).

At the same time, the ATUS time diaries indicate that less than 1% of Americans' free time is devoted to all such Table 2 arts participation activities, too small to be detectable in the 'social capital' block in Figure 1 from ATUS. Even the Table 2 levels of arts participation in SPPA, total less than five yearly episodes (or less than 15 annual hours) of arts/culture participation per year. However, these SPPA data do show that the arts are engaged in more by individuals who have a long working week or are heavily involved in other activities, suggesting a 'Newtonian' pattern of behavior in which 'Bodies in motion stay in motion' (a corollary to Parkinson's Law (1962) that 'If you want something done, give it to a busy person').

Figure 2 compares the Table 2 SPPA declines in benchmark arts participation with declines in other leisure activities over these three decades. Even more notable downward trends are found for gardening (from 60 to 39%) and attending sports events (from 48 to 30%) than for arts events. At the same time, the time-diary data in the ATUS and earlier diary studies in Figure 1 do reveal at lease a doubling of exercise and other fitness activity since 1965 (Robinson and Godbey, 1999).

Figure 3 shows the trends in Americans' ranking of their music preferences in the SPPA between 1982 and 2012, one of the few surveys to continuously monitor something of the

Figure 2 1982–2012 Trends in % of Americans liking different music (age 18+). SPPA, 2012.

'quality' of US cultural consumption. It can be seen that there have been some marked changes in these music tastes over that 30-year period. Whereas country-Western music was rated as most liked in 1982 (when nearly 60% of Americans said they liked it), that dropped nearly 20 points to 40% liking it in 2008. That put country music well behind the 48% of the 2012 public saying they liked rock (or classic rock) music, the new most liked of the music genres presented to 2012 SPPA respondents. In terms of when asked to name their *single* most favored music, rock music was also highest at 26%, with country music at 17% (and down only from the 20% ranking country music highest in 1982).

Classical music, a more elitist or 'high-brow' of the SPPA music genres, stayed about the same 26–28% liking level as it had in 1982 – staying at about on its par with jazz, blues, and hymns/gospel music. Liking of opera (perhaps the most elitist genre) remained at the bottom of liked music, but again close to its 10% liking level in 1982.

While there are significant education differences in these rankings, respondent education does little to explain the decline in liking of country music – which happened in all education groups (in contrast to classical music which showed remarkable stability by education).

Conspicuous Consumption

Veblen (1899) first argued that Americans at the time engaged in conspicuous consumption as their way of expressing their culture and values. Sullivan and Gershuny (2004) have more recently argued it is inconspicuous consumption. One answer may lie in the argument that the costs of the 'survival market basket' keep increasing as community norms and expectations about possessions keep rising. Another is the increased media emphasis on the consumption of goods and services, as characterized in Schor's (1999) 'Overspent American' and by Ritzer's (1999) depiction of 'Cathedrals of Consumption' – the ever-more elegant shopping malls, vacation cruises, and home entertainment systems on which Americans spend their work incomes. The hours invested in these goods and locales suggest that the 'culture' being consumed with their work dollars is rather superficial, redundant, and spiritually uninspiring in contrast to the potentials of classic leisure.

Subjective Aspects of Free Time

Since leisure has been argued to be a fundamentally subjective state, it should require more subjective measures to reflect it. Four types of subjective measures that have been proposed as reflective of greater leisure or quality of life include the following.

Greater Enjoyment

In terms of overall happiness, life satisfaction, or quality of life; there has been little change in the roughly 33% who say they are 'very happy' since 1972 (although there has been about a 2% increase in saying 'not very happy' since 2008). This does not seem to reflect the small increase in free time found in Table 1, if one might expect happiness to increase with more free time.

When asked to rate the enjoyment levels of separate different activities in their ATUS time diaries, respondents generally rate their free-time activities higher than housework, paid work, or other 'productive' or 'necessary' activities, but with several exceptions. These subjective well-being ratings among ATUS respondents indicate that the most positively rated diary activities involve social interaction – in reading and playing with children, in volunteering activities, in religious practice. Lower enjoyment is found for routine housework and work activities, with medical care and job searching being least enjoyed (Robinson, 2014). Many prominent free-time activities rate below average in enjoyment, including TV, communicating by mail and other media, and even relaxing.

However, earlier surveys found that when asked simply to rate them on a general side-by-side basis, most workers said they enjoyed their work and free-time activities equally (Robinson and Godbey, 1999). Saturday and Sunday activities, when free time is 50% higher per day than during the week, are rated as no more enjoyable than weekday activities, further supporting the indistinguishability of work and free time.

Less Time Pressure or Fatigue

Also despite the increased free time in Figure 1, only slightly more people now describe their lives as 'always rushed' than they did 45 years ago, and as having less discretionary 'time on their hands'. Both of these less pressured perceptions, however, are associated with notably higher levels of personal happiness (Robinson, 2012). Indeed, almost half respondents who said they almost never felt rushed *and* almost never had unwanted time on their hands said they were 'very happy' compared to about 25% of the rest of the public. In separate surveys, more workers continue to report that they would give up a day's pay to get a day off from work, and far more Americans say they would prefer to work longer hours in general – but presumably mainly to earn extra income. Fewer than 25% of workers in 2009 said they were 'very tired' at the end of their work day – much the same as found in 1975. More educated workers are less likely to feel tired, as are male workers in general.

Appreciation of Quality

The SPPA surveys described above do not find increasing proportions of Americans saying that they enjoy more 'sophisticated' forms of music, like classical music or jazz. However, there is anecdotal evidence as well of increased complexity of TV programs (Johnson, 2005) and consumption of more 'gourmet' foods and beverages. One example is in patterns of beer consumption, in which American microbreweries have taken the lead in reinvigorating classic and creating innovative new beer styles. These craft brewers now reaching close to 10% of the beer market, a small percent but double that of a decade earlier.

Time Estimates

Further clues to how Americans feel about their time and leisure emerge from comparing their *estimated* activity times with their presumably more accurate time-diary times. Paid work activities continue to be overestimated but far less than

for housework and other family care activities or volunteering (by 50–100%). In contrast, sleep is *underestimated* by an hour a day (Robinson and Michelson, 2010), while free time is underestimated by 50% or more (about 18 estimated weekly hours vs. closer to 40 diary hours); the GSS estimate question on TV time, surprisingly, is accurately estimated at about 3 h per day. Thus, the lives that Americans think they are leading seem to reflect Weber's 'Protestant ethic' more than the activities respondents report in their 'real-time' diaries.

Summary and Conclusions

While the Figure 1 time-diary trend indicates that Americans of working age still have slightly more free time than they did 50 years ago, Table 2 and Figure 2 from the SPPA suggest declines in the proportions of Americans participating in the arts or in other more serious forms of leisure. GSS data also indicate that these declines in 'serious' have occurred during a time when the college education levels of the US public have improved significantly. Moreover, this increase in public education has not produced a population with improved vocabulary skills according to GSS data (Robinson, 2010). At the same time, Figure 3 shows no notable decrease in the proportions of the Americans who claim to appreciate classical, opera, or jazz music.

Table 1 suggests that the American way of life and leisure seems rather similar to that in other Western countries, in creating more free time and thus more opportunity for leisure, although our hours and proportions of free time devoted to TV have increased. However, significant proportions of Americans still describe their lives as hectic and remain committed to working longer hours than may be necessary, presumably to keep up with the culture of consumerism. Work may provide more quality of life for people than is commonly believed, even if it does not contribute to the ideals of leisure identified by philosophers and leisure scholars.

What is needed to advance our understanding and appreciation of leisure are more systematic qualitative studies of the meaning and benefits of various activities in people's lives (much as begun by Marsden and Swingle, 1994). There are several insightful individual studies of this type (e.g., Viditch and Bensman, 1958; Bellah et al., 1985; Hochschild, 1997; Darrah et al., 2007), but they too rarely connect with one another, address issues raised by quantitative research, or are conducted with representative samples. The meaning of free time and leisure for typical Americans could be the ideal focus for studies using the 'representative ethnography' approach described in Robinson and Meadow (1982).

What is it, then, that would represent uses of free time to satisfy criteria for leisure, or the improved quality of life implied by the term 'leisure'? Various philosophers and social critics offer alternative criteria and rare unanimity, but one might emphasize the following features or experiences:

(a) a (nonwork) skill or talent for its own sake;
(b) a more discriminating palate or set of tastes;
(c) a personal cosmology or philosophy of life;
(d) spiritual regeneration or insight;
(e) stronger ties to some larger community;
(f) greater self-actualization; and
(g) elements of play, curiosity, and wonder.

What seems to be called for at this point, then, is greater attention to operationalization of a set of reliable and valid

Figure 3 1982–2012 Trends in leisure and arts activities (age 18+). SPPA, 2012.

'leisure indicators' based on such concepts that could be regularly monitored to reflect whether progress is being made on the nonmaterial, as well as the material, quality of the public's leisure, *and* work time.

Abstract

This article reviews the topics that have been investigated, the research methods that have been employed, the main theoretical perspectives, agreed conclusions, and issues that remain unresolved since this subdiscipline was formed in the 1960s. We see that solid advances in knowledge have been accomplished through research into the relationships between the uses of leisure and occupations, gender roles, and life course stages. Meanwhile, grand claims about the role of leisure in society have yet to be developed into testable theories about the roles of particular kinds of leisure under specified circumstances. Also, the sociology of leisure has yet to embrace the likelihood that the western version is not necessarily the sole form of modern leisure.

Theoretical Approaches

History and Status within Sociology

The sociology of leisure was created as a subdiscipline in the 1960s, as indicated by the formation of the International Sociological Association's Research Committee 13 (RC13) in 1970. Sociologists had studied leisure previously (see in particular De Grazia, 1962; Lundberg et al., 1934; Veblen, 1899), but usually as an offshoot of studies of workers in particular occupations or in family and neighborhood research. From these beginnings, right through to the present day, this subdiscipline has encountered difficulties in defining its boundaries and claiming possession of its field. There are several reasons for this.

Leisure Studies

At the same time, (in the 1960s), when the sociology of leisure was being institutionalized, universities across North America were creating a subject called 'leisure studies.' Initially the undergraduate and postgraduate programs were preparing students for careers in, and faculty were conducting investigations relevant to, parks and other public recreation services; but the curricula and the research interests of the faculty spanned the whole of leisure. From the 1970s onward, leisure studies departments and courses spread throughout universities in the UK, Australia, and New Zealand, and then, albeit far less densely, throughout the rest of Europe, Asia, and Latin America. A consequence is that everywhere in the world, sociologists who study leisure have been as likely, probably more likely, to be based in leisure studies rather than squarely in sociology departments; and within leisure studies, the boundaries between sociological and other contributions have never been clear.

Challenges from within Sociology

Within its own discipline the sociology of leisure has always faced rival claims on its field. Initially the main challenge was from cultural studies, especially the genre that examined popular cultures. Media sociology has always positioned itself outside the sociology of leisure, and likewise the sociology of the arts. Youth researchers have been more likely to investigate youth *cultures* than youth *leisure*. Another strong challenge during the last 30 years has been from the sociology of consumption.

Fragmentation within

In some respects, the sociology of leisure has fallen victim to its own success in reaching a size where it has been possible for specialists in sport and tourism to organize their own conferences, form scholarly associations, and launch their own journals. These sources of fragmentation affect all disciplines but leisure may be especially prone to be affected by it. Students, teachers, and researchers are far more likely to be enthusiastic, even passionate, about a particular art form or sport than about leisure in general. Moreover, the term 'leisure industries' is not a composite category. Providers organize themselves into tourism, TV, publishing, computer games, etc.

The sociology of leisure has needed, and needs perpetually, to demonstrate that there is value added by scanning the entire field of leisure. It needs to show that inserting an intermediate level of analysis is preferable to leaping straight from data on sport or tourism to theories about society at large. It also needs to show that leisure is a concept with strengths that complement those of consumption and culture; and that sociologists, against leisure scholars from other disciplines, have something extra, something distinctively sociological and valuable, that they can contribute.

Findings

Work and Leisure

This was originally the main research issue in the sociology of leisure. It became so simultaneously, in three different ways. First, *modern* leisure was treated as a product of the modernization of work. Second, a long-term growth of leisure was seen as an outcome of the shrinkage of work time. Third, uses of leisure offered additional evidence about the 'long arm of the job.'

Modern Work, Modern Leisure

Most sociologists have treated 'modern' leisure as a historical outcome – a product of the broader division of labor associated with modernization – rather than a socio-cultural universal construct. There is continuing debate about whether a leisure concept can be usefully applied to the free time, amusements, and pastimes of premodern eras, and whether these societies had a different kind of leisure. One view is that modern leisure is a debased version of the purer leisure enjoyed in ancient Greece, albeit just by a minority of free men (see De Grazia, 1962).

That said, it has been agreed that during the industrial revolution, paid work was relocated into offices, mines, and factories. In industry employees worked at set times fixed by the clock, under work-specific authority, and often amid work-specific relationships with colleagues. Modernized industrial work was organized rationally – to minimize unit costs and to maximize output per unit of resources invested. Customary ways were swept aside, if necessary. Work was certainly not organized to maximize job satisfaction. Thus work became a part of life, and leisure, while not occupying the whole of nonwork time, was located within it.

Work Time and Leisure Time

The pioneers of the sociology of leisure in the 1960s were inspired, above all else, by the historical growth of leisure time. They knew that standards of living were rising; they wrote during the first decades of so-called mass affluence. They knew that the benefits of economic growth were being taken partly in the form of higher real earnings and higher levels of consumer spending, but they were more impressed by the extent to which working time had been rolled back. Since the industrial revolution, the length of a normal work day had been reduced from 12 h to 10 h, and then to 8 h. The weekend had expanded from one day to one-and-a-half days, and then to two full days. The annual holiday entitlement had grown. The normal working life had been trimmed at both ends. Thus in the 1960s Joffre Dumazedier (1967) was able to proclaim a great historical inversion – the typical worker was spending more time at leisure than at work. There appeared to be no reason why these trends should not continue.

Some sociologists were cautious. Harold Wilenski (1963) noted that most of the extra free time created since the early decades of industrialism had enlarged the size of groups outside the paid workforce (mainly the young and the retired); that the decline in hours of paid work had affected only manual employees; and that their gains had achieved no more than winning back the free time that was lost during industrialization. Staffan Linder (1970), an economist, noted that leisure time was increasing more slowly than consumer spending power, and forecast the growth of a 'harried leisure class' whose main problem would be 'finding the time,' Geoff Godbey (1975) claimed that in the United States it was not leisure, but a condition that he described as 'anti-leisure' that was growing – time-pressured compulsive activity and consumption. These warning voices have proved remarkably prescient.

The terms of the work time/leisure time issue changed abruptly in 1991.We can date this precisely because the catalyst was the publication of Juliette Schor's book, *The Overworked American*. Schor, another economist, claimed that in America, working time was lengthening, that Americans were working too long for their own good, pressured by greedy employers and the 'addictive power of consumption,' Schor's book ignited a search for other countries where working time was lengthening (see Zuzanek et al., 1998). Up to now there is no country where a general lengthening of work time has been confirmed (as opposed to alleged). In the United States, Schor's claim has not been corroborated by time budget evidence (see Robinson and Godbey, 1999). However, by the end of the 1990s there was agreement that the earlier shortening of work schedules had ended, probably in the 1970s; this consensus has not prevented 'work–life balance' becoming a public and a thoroughly researched issue. Although there are 'time pioneers' (see Horning et al., 1995) who have deliberately opted to downshift to enjoy slower and more frugal lifestyles, up to now these pioneers have not been trendsetters.

The Long Arm of the Job

This phrase underlines the extent to which people's jobs control not only their lives at work but also what they do in their 'own' time. From the very beginnings of leisure research it has been noted repeatedly that the middle classes 'do more,' the main exception today being television viewing.

However, in the 1950s and 1960s, rather more attention was paid to how particular occupations tended to foster distinctive uses of leisure. This was observed among deep-sea trawlermen (Tunstall, 1962), coal miners (Dennis et al., 1956), assembly line workers (Friedmann, 1961), and so-called organization men (Whyte, 1957). Spillover and compensatory work–leisure relationships were distinguished. Stanley Parker (1971) relabeled and expanded these concepts into an extension, neutrality, and opposition typology of work–leisure relationships, arguing that extension was most likely when people found their jobs interesting, when they identified with their work roles, and with work colleagues also. In contrast, opposition was likely when people found their jobs disagreeable and celebrated the end of work shifts by doing things that were enjoyed largely because they were different.

In the mid-1990s, initially in North America, researchers discovered that the middle classes (managers and professional-grade employees) were typically leisure omnivores, characterized by the wide variety of their leisure tastes and activities (Erikson, 1996; Peterson and Kern, 1996). Subsequently middle class omnivores have been spotted all over the world (see, for example, Sintas and Alvarez, 2002). The middle classes not only dine out more frequently than the working classes but do so in a wider variety of catering establishments (Warde et al., 1999). The middle classes now produce most rock and pop as well as classical musicians. One explanation of this phenomenon is the scale of upward social mobility into expanding middle-class occupations (see Eijck, 1999).

Unemployment

There was a flurry of studies into the leisure of the unemployed in the 1980s, when mass unemployment had returned to the Western world after the period now recalled as the '30 glorious years' – the post-World War II decades of full employment and

steady economic growth. The initial questions posed about the leisure of the unemployed were soon answered. We learnt quickly that the unemployed tend to 'do less' for a variety of reasons – financial, loss of work-based social relationships, and loss of status (reluctance to expose spoiled identities to the public gaze). Does participation in leisure activities help to maintain the well-being and morale of the unemployed? Yes, when levels of leisure activity are maintained (which is exceptional), but even then, not at the levels of well-being that are normal within the employed population (see Glyptis, 1989; Havitz et al., 2004).

Leisure Work

Higher levels of leisure spending and leisure activity have led to the expansion of leisure industries, which have become a main, if not the main, source of new jobs in countries all over the world.

Leisure industries include some of the so-called creative industries, whose main asset is intellectual property rights (for example, computer software, musical and other kinds of 'texts'). Some leisure industries have glamor roles (sports and screen stars). Employees can be attracted into mundane jobs by their proximity to glamor, but overall the leisure industries contain many mundane occupations. Many of the jobs are seasonal (especially in tourism), part-time, and involve being on duty at unsocial hours (jobs in the nighttime economy, for example). Employees are often required to perform aesthetic labor (see Warhurst and Nickson, 2007), where the appearance and personality of the employee are part of the service rendered to customers.

Gender and Leisure

During the 1980s this topic replaced work as the leading issue in the sociology of leisure. The second wave of feminism forced 'gender' to move up the research agenda. Feminists' initial complaints were that leisure research had neglected gender in general and women's leisure in particular. These criticisms were immediately accepted and it is now 20 years since it was possible to complain that gender or women's leisure are neglected. The original questions raised about leisure and gender have now been answered, and new issues have taken their place.

Women and Patriarchy

An initial claim was that, in leisure, women were the disadvantaged sex due to a combination of time and money constraints and heavier socio-cultural regulation than experienced by men (see Deem, 1986; Green et al., 1990; Henderson et al., 1989). Women's leisure time disadvantages arise from the double shift, with housework and child care remaining primarily women's work (see Bittman and Wajcman, 1999). As regards money, it is accepted that women have been and are still disadvantaged. Men are more likely to be in employment, earning their own money. Women in employment generally earn less than men. Household income is not always shared out equally between males and females. Women are less likely than men to be able to separate their 'own funds' from household funds (Pahl, 1990). Socio-cultural regulation makes it more improper for women than for men to consume alcohol fulsomely and become intoxicated; to play strenuous, aggressive, competitive sports; to go alone to cinemas and other leisure places; and to enjoy leisure in mixed-sex company when not accompanied by their sexual partners. However, researchers have noted that times are changing. In Western countries the differences between men's and women's uses of leisure have narrowed.

Cross-cutting the debate about the extent to which the leisure of one sex has been and remains disadvantaged, there have been claims that women's leisure is qualitatively different to men's leisure. It has been claimed that mainstream leisure research has proceeded unwittingly with a masculine concept of leisure, and that, as a result, women's leisure has been misrepresented. The main gender differences are said to be, first, that men associate leisure with particular times (when they are not at work) whereas women tend to identify leisure with particular kinds of experiences, activities, and being with particular people. Second, it is alleged that men tend to appraise their leisure quantitatively (how much time they have and how much they do in this time) whereas women's appraisals are in terms of the quality of their experiences (see Gregory, 1982; Lenskyj, 1988).

Men and Masculinity

Men's studies require that masculinity (just like femininity) be treated as a problematic social construct, following which we recognize that there can be different versions of masculinity (maybe specific to social classes or ethnic groups), and that some men may find their masculine scripts just as constraining as femininity is for some women.

As yet there are no signs of men collectively rejecting all forms of masculinity. Rather, we now have abundant evidence of men using leisure to retain conventional masculine identities in inhospitable historical contexts. Deindustrialization has destroyed swathes of jobs that required toughness and endurance. The advent of greater independence for women has deprived males of the traditional breadwinner role. One male response has been to use leisure to maintain conventional masculine identities (see Blackshaw, 2003).

Sexualities

Most leisure sites are places where sexual roles and identities are celebrated and enacted. Anyone who enters a mainstream leisure facility is likely to be treated as a sexualized subject, and to feel able to treat others similarly. Women in particular are likely to be subject to sought or unwanted attention.

Sociology's interest has been, first, in the use of leisure spaces to develop and enjoy sexual partnerships, and second, in how the operation of heteronormativity marginalizes people with other sexual identities – gays and lesbians, and presumably pedophiles also. Breaching heteronormativity still invites ridicule or worse in sports clubs and, indeed, in most leisure places (see Wellard, 2002). A response in sociology has been the development of 'Queer' studies, in this case viewing leisure sites from the perspectives of nonheteros (see Cauldwell, 2006). A response in the wider western societies has been for gays, lesbians, and bisexuals to create their own leisure spaces – bars, villages, sport clubs, etc (see Skeggs, 1999).

The Life Course

Leisure and Age

Sociological work on leisure and life course really began with the Rapoports' pioneering study in London in the 1970s (Rapoport and Rapoport, 1975). These investigators observed how the family life cycle created different preoccupations and interests at successive life stages, which interacted with employment careers to produce characteristic uses of leisure. Shortly afterward in the United States, Estes and Wilenski (1978) identified the 'life cycle squeeze.' This refers to the squeeze on adults' time and money when they embark on the formation of new households and families. Family life events are still the main junctures where leisure patterns unfreeze and are reconstituted (Gershuny, 2003).

In recent years, there has been an upsurge of interest in leisure in later life; a response to increased longevity, the supersized baby boomer cohorts approaching and entering later life, and evidence (see also below) that leisure activities are especially beneficial for the well-being of older people, for whom 'satisfiers' connected with work and family roles are less likely to operate.

Leisure Biographies

Some of the most thought-provoking research findings have been from studies that have traced individuals' leisure biographies, sometimes with retrospective data (there can be recall problems) and sometimes with panel methods. These studies have revealed powerful long-term continuities in leisure interests and activities. People who play sport and hold office in voluntary associations during late adulthood, were typically playing these same roles (though not necessarily in the same sports or associations) when they were young adults (McGuire et al., 1987; Mihalik et al., 1989; Roberts et al., 1991; Scott and Willits, 1989). Childhood and youth are the prime life stages when individuals form leisure interests and acquire basic skills. In some individuals these leisure interests and skills may lapse, in which case they are less likely to be resumed than in the case of those who have remained continuously involved and active.

Age, Cohort, and Generation

Current and earlier cohorts of older people were children at a time when opportunities to form leisure interests and to practise such activities were far fewer than today. So the low rates of leisure participation in current older age groups may not be straight-forward age effects but could be a cohort effect, due to the poverty of childhood leisure socialization years ago.

The baby boomer cohorts who are now approaching or entering retirement are the first cohorts to have grown up in postscarcity societies. The Woopies (well-off older people) who remain highly leisure active, are a minority within current cohorts but will become more numerous if the baby boomers turn out to be a 'change generation' that remains willing to take on debt and, if necessary, to spend capital that is tied up in their dwellings, in order to sustain active leisure for as long as they are physically able.

Leisure and Well-Being

In leisure studies (rather than just the sociology of leisure) the leading theories in recent years have been about whether, and if so how, leisure can improve personal well-being. We now know how leisure can be a source of 'optimal experience,' what Csikszentmihalyi (1990) calls 'flow.' We know about the special satisfactions that arise from serious leisure (Stebbins, 1992). We also know that all uses of leisure raise levels of self-reported life satisfaction provided the leisure is active (takes people out of their homes), social rather than solitary, and structured so that the behavior can become routine, making personal motivation on each occasion unnecessary. These same uses of leisure also improve physical health, but here physically active leisure is especially beneficial (see Isao-Ahola and Mannell, 2004).

Leisure and Status Attainment

Sociologists have investigated the role of leisure, if any, in lifetime status attainment. There are never-ending leisure projects to save youth judged to be at risk, excluded, or impeded by multiple disadvantages. Although many of these projects are monitored and can usually produce enough signs of positive outcomes to secure continued funding, the social science verdict is that the evidence remains inconclusive (see Coalter, 2007; Collins and Kay, 2003).

The Societal Role of Leisure

Parsonian functionalism gives leisure a latency role – allowing pentup emotions and other otherwise suppressed drives in personality systems to be expressed (Parsons, 1951). The Frankfurt School's critique of the culture industry claimed that its role was to pacify a potentially rebellious working class (see Bottomore, 1984). More recent neo-Marxist critiques of the consumer society deploy a similar argument about consumer culture's soothing balm (Baudrillard, 1998).

Joffre Dumazedier (1967), the first president of RC13, had different ideas. As leisure grew in scale it was expected to play a stronger role in society. Specifically, Dumazedier treated leisure as a source of values (choosing and doing things for intrinsic satisfaction) that he expected to invade other domains like work places and families. Subsequently these ideas have been reformulated with 'identity' replacing 'values' as the central concept. Postmodern conditions are said to have weakened modern structures and their associated roles (occupational and gender roles, for example), whereas people are able to use consumer roles to tell themselves and others who they are.

Leisure and Comparative Sociology

The comparative sociology of leisure remains in a prolonged infancy. The earliest and the most recent comparative studies have simply drawn together accounts of leisure in their countries by country-based authors, writing to a common template (Cushman et al., 2005; Szalai, 1972). The European Time Use Survey (see MacInnes, 2006) has made progress in harmonizing data, but only for a limited number of European countries, and the evidence is purely quantitative.

Quantitative comparisons have found very similar uses of leisure in all modern societies; the impressive amounts of time spent watching TV, for example. These comparisons have also

found similar social class, gender, and age differences in the distribution of leisure time and participation in different leisure activities.

Since the 1960s the sociology of leisure has been developed mainly by western scholars, and those based in other parts of the world have been more likely to adopt than to challenge Western sociology's definitions and classifications of leisure activities. However, leisure is now being studied by sociologists in all parts of the world: in Eastern Europe, Africa, the Middle-East, Latin America, and especially in the Asian countries that are becoming major global economic centers (see Amaral, 2008; Eglite, 2007; Jain, 2007; Qiyan Wang, 2007; Saad, 2007; Tsai, 2008). It is noteworthy that the cultural specifics of Western leisure are currently being highlighted by scholars from, or writing about, leisure in India, Japan, and China (Fox and Klaiber, 2006; Ma Huidi and Liu Er, 2009; Iwasaki et al., 2007).

Assessment, Prospects, Future Directions

The sociology of leisure was established as a collective enterprise at a time when major new technologies of the early- and mid-twentieth century – radio, movies, recorded music, television, the motor car, and air travel – had already changed or had begun to change, people's lives in first world countries. The relevant changes were occurring at a time when paid work schedules were contracting and disposable incomes (not required for essentials) were growing.

The present-day sociology of leisure has far less to say about the future than was the case in the 1960s and 1970s. This is despite the arrival of another generation of new technologies – the information and communication technologies – that have delivered multichannel television, personal computers, mobile phones-plus, and the internet. It is also despite confident predictions of climate change that will be only ameliorated by changes in how we produce and consume, and knowledge that the planetary resources on which current first world lifestyles depend will one day be exhausted. Sociology in general, not just the sociology of leisure, has become cautious. We know that many future forecasts made in the mid-twentieth century have been confounded.

Sociologists of leisure know that their subdiscipline needs theoretical renewal. Building squarely on the foundations already laid cannot be sufficient, given that these foundations have always been subject to criticism (see, in particular, Rojek, 1995, 2009). It is likely that some of the most exciting, paradigm-shattering sociological work on leisure will forthwith be conducted outside the first world countries where the subdiscipline was born. Are the new market economies of Eastern Europe, Latin America, Africa, and Asia still catching up; or are late-development effects propelling these countries ahead in certain respects? Leisure is a site where issues of much wider interest within and beyond sociology can now be explored.

Lesbian and Gay Activism in Latin America

Abstract

Lesbian and gay activism in Latin America exhibits features that manifest themselves in other parts of the world, it possesses a variety of specificities that are the result of colonialism, indigenous characteristics, and the influence of global processes. Chief among these are fluid understandings of sexuality, the historical omnipresence of one religion and, more recently, the adoption of more contemporary conceptualizations of sexual citizenship. While movement characteristics vary across Latin America, in recent years, several gay and lesbian movements have assumed a collaborative approach with governments and have been very successful in attaining a variety of policy objectives, ranging from antidiscrimination legislation to same-sex relationship recognition.

Introduction

Latin America's sociopolitical development has historically been influenced by exogenous forces which, blended with indigenous elements, have produced distinct regional characteristics. Colonialism, and the region's dependent integration into the global economic system, have encountered strong local traditions that have created social and political hybridities, making the region difficult to classify: while its cultures possess numerous Western traits, they also exhibit important indigenous characteristics. Lesbian and gay activism in Latin America has emerged from such hybrid contexts and its characteristics are the result of global processes, fluid understandings of sexuality, the historical omnipresence of one religion, and, more recently, the adoption of more contemporary conceptualizations of sexual citizenship.

Regional Understandings of Sexuality

Latin American understandings of sexuality have historically been fluid. The conquest of Latin America by Iberians during the sixteenth century saw an attempt to impose very rigid European definitions of gender and sexuality, which revolved around ideas of patriarchy, sex, reproduction, and gender relations guided by natural law principles. These European definitions date back to the writings of Saint Thomas Aquinas. Thomist philosophy, adopted by the Catholic Church during the Second Spanish Scholasticism, supported a binary conceptualization of gender roles and viewed sexual relations as having as primary goal, the procreation of the species. Same-sex relations therefore violated natural law and 'sodomy' was made the worst type of sin (the heinous crime or *pecado nefando*). The proscription of homosexuality became Church policy in medieval Spain, punishable by death, by the *fuero real*. The colonial enterprise attempted to impose these ideas on the new conquered lands of the Americas by Spanish conquistadors. In 1497, 5 years after the conquest, the Spanish Kings reaffirmed the *fuero real* and upheld the death penalty for the commission of 'heinous crime against nature' (Nesvig, 2001). The Church's official position on homosexuality became colonial policy and it regulated same-sex relations for centuries. Starting with the prosecuting of the first 'sodomite' by Mexican Inquisition in 1524, same-sex relations were systematically persecuted by civilian and church authorities.

However, the colonial enterprise attempted to impose these views on a continent in which inhabitants possessed widely varied understandings of sexuality. While that exists limited research on pre-Columbian sexuality, the one there suggests that some societies did not adhere to uniform norms regulating sexuality that followed dichotomized male–female gender roles based on sexual activity guided by reproduction. In some societies, such as the Mexica, the Zapotec, and the Nahua, hereditary lineage among the political elite was an important mechanism for the maintenance of power, and marriage between a man and a woman played a central role in the process (Sousa, 1997; Buckhart, 1997). In these cases, binary gender systems built around procreation appear to have been important. However, in what were highly stratified societies, evidence suggests that, outside the ruling classes, the existence of nondichotomized gender systems among indigenous peoples was common (Williams, 1986). In effect, scholars have pointed to the existence of a variety of gender, sexual, and social roles that did not conform to Western understandings of dual male–female gender systems and to varied ideas of what constituted appropriate sexual behavior.

Colonialism saw a forceful attempt to impose natural law ideas surrounding sexuality, but fluidity in understanding sexuality has survived. Unlike experiences elsewhere, processes of state formation in Latin America were characterized by top-down dynamics, which were not completely successful in transforming preexisting social relations. This is most obviously observed in the perseverance of indigenous cultures and languages in many parts of the region: the newly created states were not able to reach down to all areas, and semimarginal cultural pockets out of the reach of the state have survived. In many of these culturally autonomous pockets, natural law principles simply did not take hold. A good example is perhaps the *muxe* of Oaxaca, Mexico. Muxes are individuals who identify themselves as a third gender and who practise sexual relations with individuals of different sex (Stephen, 2002). Muxes are accepted by their society.

Fluidity has also remained in nonmarginal societies. The particularities of state formation in Latin America have resulted

in a gap between expected social norms and their compliance. This attitude is well encapsulated by the Latin American adage of *obedezco pero no cumplo* (I obey but do not comply with). While it is commonly associated with the dualism that exists between legal formalism and compliance with the law (lax adherence to the rules), the adage also captures a generalized attitude regarding sexual practices. Despite the separation of Church and State that most countries instituted, with varying degrees, during the nineteenth century, the Church continued to play an important role in dictating and upholding social mores. However, adherence to these norms has for the most part been limited to the public sphere, and this includes sexual practices. While homosexuality has been, and continues to be, stigmatized, the criminal codes of the new republics, which were modeled after the Napoleonic code of 1804, did not criminalize consensual same-sex relationships (with very few exceptions, such as Chile). Unlike some western European countries and their colonies elsewhere, the creation of the category of 'homosexual' in the 1870s did not come about with an explicit legal regulation. The result has been an important dualism between what is socially expected in the public sphere and what individuals practise in private. As Mario Pecheny has argued, invisibility and discretion have been expected of Latin American homosexuals and social interaction around homosexuality follows a double moral standard that condemns homosexual practices in public. Yet it tolerates them provided they are hidden from view (2004). As a result, in Latin America the organization of peoples' lives and the construction of identities around categorized sexualities have historically not been common and many individuals who may engage in same-sex practices do not define themselves as 'gay.' Contemporary Latin American lesbian and gay activism thus emerged from within these broader conceptualizations of strong distinctions between public expression and private sexual behavior.

Early Activism

The dualism that existed between the public and the private realms allowed homosexuals to carve up intimate socializing spaces in Latin America's bigger cities in the 1940s and 1950s. Activities such as the *jornais cariocas*, in Rio de Janeiro, associations made up of *felipitos* in Bogotá, and the lesbian events of *fiesteras*, in Buenos Aires, allowed for such socialization. However, these activities did not have political objectives. Political activism did not emerge until the late 1960s and 1970s in the Argentina, Brazil, and Mexico within a context of broader sociopolitical processes both domestic and international. On the domestic front, the bigger countries began a process of industrialization during the postwar years, which contributed to the expansion of a middle class, growing urbanization, higher levels of education, and increased secularization. A new generation of Latin Americans, one that was more critical of established understandings of social and sexual relations, began to adopt more liberal ideas regarding gender relations and sexuality. This generation began to challenge norms regarding contraception, patriarchy, and traditional values. In several countries of the region multiple countercultural groups emerged. At the same time, liberation theology, which called for a new interpretation of Christian scriptures to bring about social change, was adopted by numerous young Catholics. It spread throughout the region and motivated various sectors of society to mobilize as it rejected passive acceptance of perceived injustices. A new generation of Latin American youths became therefore a lot more receptive to political events taking place abroad as part of a cycle of protest that swept the world by the late 1960s, which expressed itself most notably through the 1968 French student movement, the demonstrations against the Vietnam War and Prague's Spring. This context allowed for the emergence of women's, African-American, indigenous and student movements throughout the region.

Latin American Lesbian, Gay, Transsexual and Bisexual (LGTB) activism emerged within these larger sociopolitical processes (Brown, 2002; Díez, 2011). By the late 1960s, Argentine and Mexican homosexuals decided to organize to discuss collectively their personal experiences with sexuality and the social stigmatization of homosexuality. The first organizations were thus formed. While the Stonewall riots of 1969 of New York are widely viewed as catalyst for the emergence of the gay and lesbian movement in the United States, and according to some, in the world, some Latin American homosexuals began to organize before then. In effect, the first gay organization in Latin America, *Nuestro Mundo* (Our World), was founded in 1967 in Argentina, 2 years before those summer riots. Our World was followed by the formation of the Homosexual Liberation Fronts in 1971 in both Mexico and Argentina. Inspired by the development of the first gay liberationist groups in the United States and some western European countries, and the literature produced by the US organization the *Black Panthers*, these early groups began to articulate a discourse based on the need to liberate homosexuals from the oppression created by social stigmatization.

These organizations were formed mostly by leftist students, intellectuals, and activists from union movements and had a Marxist bent. They were for the most part urban, middle-class individuals who adopted antiestablishment positions and called for an end to imperialist oppression from the global North. An important characteristic of these early groups was the uneasy relationship they had with the institutional Latin American left given its traditional understandings of sexuality. Many of the first activists were not welcome by established leftist movements and some were actually expelled from Communist parties, which had official positions declaring homosexuality to be a bourgeois practice. In spite of their isolation, Latin American gay activism has since then taken a decidedly leftist position on politics. The same was not true for relationships that many activists formed with other social movements. A salient aspect of early activism in Latin America was the close relationships that activists formed with women's groups early on. Gay and lesbian activists were heavily influenced by second-wave feminism and forged close relationships with women's organizations. Steeped in feminist debates, some activists included a broader perspective in their early struggles and argued against patriarchal oppression and for gender equality. Given that the important role students and intellectuals played in early activism, activists were steeped in the theoretical discussions regarding homosexuality that gathered pace at this time in advanced democracies.

In countries in which gay activists organized and mobilized, they managed to ignite public debates regarding sexuality in the early 1970s. Through the publication and distribution of

bulletins, flyers, and magazines, and in some cases television interviews, they were able to begin national discussions regarding the ethics and medicalization of homosexuality. However, it is important to note that gay mobilization at this time was limited to the capital cities of some of the largest countries (Argentina and Mexico). In most of the region it would take years, and in most cases decades, for gays and lesbians to decide to mobilize.

Identity Formation

The evolution of gay and lesbian activism after the first spurts of mobilization varied across countries and it was largely shaped by larger political processes. In some countries, such as Argentina and Chile, the mid-1970s saw the overthrow of civilian governments by military juntas, which abruptly ended any possibility for mobilization. Activism therefore came to a sudden end as the military dictatorships undertook campaigns to 'cleanse' societies from subversives, which included homosexuals. The level of repression varied from country to country. In some cases, the military rulers launched explicit campaigns to exterminate homosexuals. As part of preparatory activities for the Soccer World Cup, which was held in Argentina in 1978, the military regime established a moral brigade, part of the federal police, with the objective of 'cleansing the streets' of homosexuals so as to 'not perturb decent people' (Rapisardi and Modarelli, 2001). Some accounts point the killing of up to 400 homosexuals during Argentina's phase of state terror (1976–83) (Jáuregui, 1987). In cases such as Chile, military rulers did not establish explicit extermination campaigns, but the regimes overall plans to suppress any form of social and political activity made it impossible for gays and lesbians to mobilize. Many homosexuals were forced to into exile. In countries, in which military repression was harshest, it would take until the end of military rule for gays and lesbians to start organizing again.

In cases in which authoritarian rule was not as repressive, such as Brazil and Mexico, activism strengthened despite unfavorable circumstances and, by the end of the 1970s, it 'came out of the closet.' In both countries, 1978 marked a turning point. Following the intensification of protests against the authoritarian regime, which saw strong student mobilization and workers' strikes in the automobile sector in São Paulo in 1977, the two first Brazilian organizations were formed: *Lampão da Esquina* (corner lantern) in São Paolo (as an alternative newspaper) and *Somos* (we are) in Rio de Janeiro. Two years later, women split from these organizations and founded the Autonomous Lesbian Feminist Group. In Mexico, the Homosexual Liberation Front operated mostly underground since its formation in 1971. However, 1978 saw the formation of three organizations, which took to the streets: the Revolutionary Homosexual Front (*Frente Homosexual de Acción Revolucionaria*, FHAR), Lambda (*Grupo Lambda de Liberación Homosexual*), and Okiabeth. On 26 July 1978, members of FHAR participated in a march commemorating the Cuban Revolution and on 2 October 1978, members of the other two groups joined another demonstration to commemorate the tenth anniversary of the 1968 government repression, which killed hundreds of students. These were the first in a series of actions that would allow these incipient movements to attain important visibility in subsequent years. In democratic Colombia, some gay organizations were also established in the 1970s. León Zuleta and Manuel Velandia formed the organization *Movement for Gay Liberation* in Bogotá. The majority of these groups asserted a liberationist discourse and adopted common slogans, such as "there is no political freedom without sexual freedom" and "the personal is political." The main objectives of these organizations were to attract attention, generate visibility, and demonstrate that homosexuality was not a medical condition. In many instances, their calls were addressed to police forces demanding the end of harassment and repression. In 1979, Mexican activists held the first gay march in Latin America, which was held in Mexico City.

Similar to what occurred elsewhere at the time, divisions among activists set in soon after the formation of many of these organizations. A wedge issue was the extent to which feminist vindications were espoused. For some groups, such as Mexico's Lambda, sexual liberation also involved a fight for gender equality and its membership articulated a vision steeped in feminist arguments. Many of its members were in fact women. Others, such as FHAR, rejected feminism and argued that, because the problémtaique of gay men was distinct from women's, their struggles could not be fought united. Another divisive issue regarded the relationship that activists thought had to be established with the state. Given the origins of activism, radical and anarchist currents permeated some sectors, which refused to work with state institutions. These groups called for more fundamental societal changes. Others, often referred as the 'reformists,' took a completely different approach and decided to work closely with political parties. In Mexico and Brazil, these reformists decided to enter the electoral field and worked together with leftist parties, which fielded the first openly gay candidates for elections in 1982. While in Mexico, reformists coalesced around one political party (the Revolutionary Workers Party) for the congressional and presidential elections held that year, in Brazil they approached candidate and parties across the political spectrum for gubernatorial and legislative elections (De la Dehesa, 2010).

It is during this time that Latin American gay and lesbian activism began to adopt characteristics of gay movements elsewhere and assumed a frame based on identity politics. Because the leaders of most of these organizations were university students and intellectuals, they were influenced by global debates of the time. The writings of philosophers such as Michel Foucault, whose *History of Sexuality* was translated into Spanish in the early 1980s, were fundamental in their understandings of sexuality and the elaboration of discourse that challenged the prevailing ethics of sexuality. The term homosexual is thus replaced with a postliberationist term 'gay' by some activists. Foucault's work, among that of others, helped many activists to deconstruct contemporary ideas of sexuality and to articulate arguments that attempted to demonstrate that same-sex relations were natural forms of sexual expression and bases upon which to build legitimate identities. In addition to an identity-based discourse, Latin American gay activism began thus to adopt traits and symbols of their northern counterparts, such as notion of being 'proud' of one's sexuality and the rainbow flag. For these 'assimilationist' groups, the struggle was

not capitalism but rather to improve people's perception of homosexuality and to fight stigmatization.

The adoption of a 'gay identity' by Latin American activism in the mid-1980s was not generalized, however. For some of the more radical sectors, the assumption of an identity politics frame amounted to a capitulation to the capitalist system and an abdication of the commitment to push for wider social change. It also remained limited to the larger urban sectors. While some gay organizations sprung in other cities, such as Guadalajara in Mexico and Rosario in Argentina, activism continued to be concentrated in the main cities and did not reach much beyond. In effect, some anthropological work points to the failure of these frames to reach homosexuals outside the big metropolises. For example, Guillermo Nuñez Noriega's work shows that, in northern Mexico, men are able to distinguish between their sexual attractions and practices and their daily lives and men that have sex with men do not always see themselves as homosexual, nor do they attempt to build a lifestyle around their sexual practices. That is to say, their sexual preferences are not the main trait around which their lives are built. In certain places, then, the Latin American historical tradition of separating the public expressions from private practices appears not to have adopted a gay identity frame. The formation of gay identities also emerged differently than in some parts of the global North: whereas the 1980s saw the establishment of gay neighborhoods in many of the larger cities in the United States, this did not happen in Latin America. Commercial establishments dedicated to allow gay men and lesbians socialization spaces sprouted during the 1980s and 1990s, and numerous bars, restaurants, and clubs opened, even in authoritarian Chile. But gay ghettos were not established.

The Influence of HIV/AIDS

The onset of the HIV/AIDS crisis in the mid-1980s had important effects on gay and lesbian activism in Latin America. Upon the report of the first cases, a moral panic emerged and conservative sectors, led by the Catholic Church leadership, mounted accusatory campaigns blaming the unnatural behavior of homosexuals for the spread of the 'gay cancer' or 'pink plague' (Díez, 2011). These campaigns had a destabilizing effect on some activists as, without much knowledge about the virus, they were forced to turn inward to look for answers. In several countries, the spread of the pandemic had a negative effect on the leadership of many organizations as numerous male leaders succumbed to the disease. In Mexico, for example, activism lost strength and lost public visibility.

In several countries, the spread of the disease significantly shaped activism and changed the relationship it had maintained with the state in important ways, marking a new phase in its evolution. While, prior to the onset of crisis activists had established a relatively confrontational approach with the governments demanding the end of police harassment and repression, they turned to a more collaborative relationship with governments. As some scholars have pointed out, the HIV/AIDS crisis in Latin America was used by many activists as an opportunity to establish a more institutionalized relationship with the state (Pecheny, 2003). Never before had questions regarding homosexuality been as visible as it became an issue of public health. Numerous organizations almost entirely devoted to the running of prevention programs were therefore established by activists, organizations that began to receive significant financial resources from governments and international organizations, such as UN AIDS. In cases such as Brazil, cooperation in the fight against HIV/AIDS established a new model of interaction whereby nongovernmental organizations became allies of the state in the formulation and implementation of prevention programs. Groups such as *Grupo Gay da Bahia* and *Triângulo Rosa* assumed significant visibility as their resources and influence increased. In some countries, the new collaborative relationships contributed to the formation of important national and international networks among government officials, practitioners from international organizations, and activists that have lasted for decades and which have been fundamental in the expansion of health care services to HIV-positive individuals (Torres-Ruiz, 2011).

Another important change regards the articulation of a rights-based discourse. In several countries of the region, HIV/AIDS allowed many activists to begin to frame their demands as an issue of rights. As the diseased ravaged on, (mostly) gay men began to mobilize around the concept of the right to health care and to transform a victimization discourse into one that placed the responsibility for the containment of the disease on the state.

The ability of gay activists to induce policy response varied across the region. In cases such as Argentina, activists managed to force the government to pass legislation fairly early on (1991) to fight the epidemic, which became central for the distribution of antiretroviral drugs when they became available in the mid-1990s. In Brazil and Mexico, legislative change in the mid-1990s made the drugs universally available to those infected. In other cases, such as Chile, it would not be until 2001 that the government would enact legislation, but even then it did not adopt a universality principle (Contardo, 2011).

Globalization and Economic Liberalism

Latin American gay and lesbian activism assumed unprecedented visibility and vigor by the end of the 1990s. As many of the region's democracies began to consolidate, and as new opportunities for mobilization arose, innumerable organizations began to proliferate throughout the region and, for the first time, activism in the smaller, less urbanized, countries became visible. By 2000, all countries in the region, including authoritarian Cuba, had some form of gay and lesbian mobilization.

A salient characteristic of the latest phase of this new activism was the adoption of a global discourse around the idea of 'sexual diversity.' Whereas demands had previously focused on the end to repression and access to health care, activism began to adopt the global discourse of equal citizenship rights for a variety of nonconforming sexual identities and expressions. Activism therefore expanded to include numerous groups, which had been invisible, such as transgender individuals. Organized transgender activism assumed public attention for the first time in several countries of the region and very active and well-organized associations were formed, such as Argentina's *Asociación por la Identidad Trasvesti Transexual* and

the *Asociación de Trasvestis Transexuales y Transgenérico*. The adoption of a new discourse was partly influenced by the splash queer theory made within larger theoretical debates around sexuality. In many countries of the region, some university gender programs expanded their curricula to include queer studies and, by the late 1990s, numerous activists and academics began to deploy the discursive tools the new theoretical approach offered.

It was also influenced by global debates on multiculturalism. During the 1990s, discussions regarding the protection of cultural minorities gathered pace and countries around the world enacted a variety of measures to protect ethnic, indigenous, and cultural minorities (Kymlicka, 2007). In Latin America, these international debates coincided with the strengthening of indigenous mobilization, which sought to renegotiate contemporary understandings of national identity and, which demanded the recognition of the multiethnic character of these societies (Yashar, 2005). The diversity called for by queer theorists therefore found a receptive audience in Latin America. Queer theory took hold among many activists in the region and, given the region's rather fluid understandings of sexuality, it resonated deeply in countries that are highly culturally diverse, such as Mexico (Monsiváis, 2004). The categorization of identities based on separate (medical-legal) sexualities lost force. Hybridity continued to characterize Latin American gay and lesbian activism.

Economic liberalization has also had an impact on activism. The region's move away from authoritarian rule coincided with the adoption of market-friendly economic programs, which liberalized markets and reduced the role of states. As market forces were allowed a freer rein, activism witnessed a certain degree of commercialization. In the main capitals of the region, as unprecedented freedoms began to be enjoyed, a new generation of gays and lesbians began to emulate consumerist lifestyles marketed in advanced democracies, especially the United States. Debates among activists on the marketization of gay identities ensued. Strong criticisms, introduced to activism by intellectuals, such as Néstor Perlongher in Argentina, Herbert Daniel and Leila Miccolis in Brazil, and Carlos Monsiváis in Mexico, were formulated about the emergence of a new commercialized identity in some quarters, which was characterized by white, middle-class men. In a part of the world with the highest inequalities between rich and poor, the new class-based identities were seen as highly exclusionary for it was unattainable for the majority of the population.

State-Directed Activism

Since the early 2000s, certain currents within gay and lesbian activism in Latin America have focused most of the attention to the push for policy reform and have, therefore, states as their sites of their struggles. Because, unlike other regions, same-sex relations were not criminalized in most Latin American countries, activism has not had to fight for the decriminalization of sodomy. As police repression and harassment diminished many activists instead turned their attention to the push for legislation to protect sexual minorities from discrimination. More recently, they have also begun to demand the recognition of same-sex relations and the expansion of benefits.

Success in the attainment of policy reform had varied widely across the region. Antidiscrimination on sexual orientation legislation has been introduced in several jurisdictions in the region and in some cases, such as Mexico, enshrined into the constitutions. In regard to same-sex relationship recognition, civil unions are recognized in numerous countries, such as Brazil, Uruguay, Argentina, Mexico, and Colombia, while gay marriage was enacted in Argentina in 2010 and is accessible to all gays and lesbians in Mexico who contract marriage in Mexico City, where it was also legalized in 2010. However, in other countries, activists have not been as successful and the push for reform continues. The expansion of rights has also included other sexual and gender minorities (Encarnación, 2011). In several countries (Mexico, Argentina, Brazil, and Uruguay), legislation has been introduced to allow transgender individuals to change their identity legally. In 2012, Argentina approved the most advanced gender identity in the world: it completely demedicalizes transgenderism, making a change of gender a mere bureaucratic procedure.

The factors behind the ability of Latin American gay and lesbian activists to attain such unprecedented policy changes evidently vary across the region. Scholarship on these developments has identified a variety of factors, which have been central, such as: cross-movement and international alliances in pushing for policy reform; access to financial resources, which has allowed them to institutionalize and professionalize their activities; the establishment of extensive networks of allies, inside and outside the state, which have supported their efforts; a decrease in homophobia levels across the region; and the framing of their demands for fuller conceptions of sexual citizenship, which have resonated in countries in which process of democratization continues to unfold (Corrales and Pecheny, 2010; Pierceson et al., 2012; Díez, 2013).

Lesbian, Gay, Bisexual and Transgender Aging

Sue Westwood, University of Keele, Keele, Staffordshire, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Older lesbian, gay, bisexual, and transgenders (LGBTs) share many of the concerns of younger LGBT, exacerbated by aging. They also share many of the concerns of older heterosexual people, magnified through the lens of gender and sexuality. The accumulative effects of discrimination and marginalization can have an impact on well-being among many LGBT in older age, although for some strong social support networks can act as buffers and promote resilience. They are also echoed in health and social care provision for older people, which is often heteronormative at best and prejudiced at worst. Many older LGBT face being unwillingly 'outed' through care needs and/or having to go back into the closet to avoid discrimination. There is a need to address ageism in the LGBT community and sexuality and gender discrimination among age-related services.

Introduction

Until very recently, there has been a dearth of knowledge about older lesbian, gay, bisexual, and transgender (LGBT) people. Studies of lesbian, gay, bisexual (LGB) aging in previous decades, coming primarily from the United States, have tended to privilege the experiences of middle class older gay men and underrepresent the experiences of older lesbians, bisexual people, and all LGB people in the upper age ranges (Grossman, 2008). The study of trans aging is an even more recently emerging field (Cook-Daniels, 2006). The term 'trans' encompasses both transgender, i.e., people who transgress gender norms for a variety of reasons, and transsexual, i.e., people who live their lives as being of a gender different from that which they were assigned at birth. Some may also identify as lesbian, gay, or bisexual, others identifying as heterosexual. With the expanding number and visibility of trans individuals, and in particular older people undergoing gender reassignment, trans identities are becoming more of a later life phenomenon.

More recently, there has been a growing body of literature on LGB and LGBT aging Witten and Eyler (2012) and a growing awareness that LGBT aging both magnifies older-age concerns, and also adds new dimensions to them. LGBT aging needs to be understood in context, including the history of oppression experienced by the most older LGBT people across their lives. There are many countries now where there is full or at least partial legal recognition and protection for LGBT people, and, in turn, their aging issues are more visible and amenable to study. However, there remain many countries in the world where same-sex relationships and gender transgressions are unlawful, even punishable by death. There are also other countries or regions, particularly those where orthodox religion plays a strong role in cultural life, where, even if not illegal, LGBT people are socially marginalized and at risk of prejudice and discrimination (AGE Platform Europe and ILGA Europe, 2012). In these variously unsafe spaces, LGBT existence itself is hard to study, because of its need to remain clandestine, and the study of LBGT aging has hardly got off the ground. As a consequence, the studies and understandings of LGBT aging that will be reported here focus primarily on research from those countries where there is greater visibility, i.e., the United Kingdom, Australia, Canada, and the United States.

LGBT aging also needs to be understood in the context of variable experiences across the life course. 'Older old' LGBT people, i.e., those in their 80s and 90s, even in those countries where it is now reasonably safe to be open to a certain extent, have typically lived most of their lives under legal and social censure, and may have been 'in the closet' (i.e., have hidden their identities) for most of their adult lives. By contrast, 'younger old' LGBT people, i.e., those in their 60s and early 70s, may have been out, or at least partially out, for most of their adult lives, in those countries where it is relatively safer to do so. All have been impacted by discrimination in varying ways, which, in turn, influences well-being in later life and concerns relating to accessing formal health and social care provision for older people.

In later life, older LGBT people share many of the same concerns as older heterosexual people (Stonewall, 2011). Those concerns are, however, magnified through the respective lens of sexuality and gender nonconformity and the cumulative effects of living in an environment of discrimination. Older LGBT people also share many of the concerns of younger LGBT people. These concerns are, in turn, mediated by older age and by ageism within the LGBT community. In fact, the notion of an LGBT 'community' can be misleading, there being comparatively little interaction between older and younger LGBT people and between older lesbians and older gay men (Pugh, 2002). Additionally, older bisexual people often experience issues of visibility and hostility in both heterosexual and LGBT contexts (Dworkin, 2006) and older trans people often experience transphobia particularly among (older) LGBT groups (Auldridge et al., 2010). Consequently, older-age issues are experienced very differently by lesbians, gay men, bi women, and men, and by trans individuals, as well as additionally layered through intersections with gender, class, race/ethnicity, religion, region, and culture.

Aging and Relationships

Older LGBT Relationships

Older LGB are more likely than their heterosexual peers to be single and live alone, to have fractured relations with biological family and to be childless (Stonewall, 2011). This is for

a number of reasons: the stigma and social marginalization, particularly historical, attached to LGB sexualities have resulted in many traditional families not being accepting of their LGB members. For many older gay men, their cohort was decimated by the AIDS crisis of the 1980s, when many gay men died, and so there are actually far fewer older gay men still alive now as a result (Rosenfeld et al., 2012). For older LGB people, social networking was very often more problematic in previous decades when many led clandestine lives, making, forming long-term associations more difficult. Many who did form long-term dyadic partnerships did so in secrecy and isolation and when one partner dies, the surviving partner is often left isolated and alone (Almack et al., 2010). Additionally, the reproductive technologies now available to individuals and same-sex couples to enable them to have children were not available to earlier generations, and at the same time social stigma made fostering and adoption also a difficult, if not impossible, path to parenthood, denying older LGB access to support from children and grandchildren in later life. The exception to this is those individuals who have formed same-sex relationships later in life, having lived the majority of their lives as heterosexuals (Cronin and King, 2013).

On the positive side of adapting to discrimination, many older lesbians and gay men have 'families of choice' (Weeks et al., 2001) networks, i.e., social support networks of very close friends, including exlovers and sometimes-lovers. However, these are often same-generational, meaning they can all need increased support at the same time. Strong social support networks act as buffers to the more harmful effects of accumulated experiences of discrimination across the life course, both reducing risk and enhancing protective factors in older LGBT (Fredriksen-Goldsen et al., 2013a, 2103b). Facilitating formal social support networks for older LGBT people can also serve to enhance resilience (Knocker et al., 2012).

For those older LGBT individuals who are in same-sex relationships, partnership recognition can play a key role in their material, financial, and emotional well-being, as will be explored in the following section. For other older LGBT people, nonconjugal relationships play an important role in later life, and the extent to which they are legally recognized, and whether that recognition is desirable, is explored in the subsequent section.

Partnership Recognition

In those countries where same-sex partnership recognition is available on a par with heterosexual marriage, older LGB couples (including LGB identifying trans individuals) in same-sex relationships are able to access the same legal rights (and responsibilities) as heterosexual couples. In terms of finances, this includes legal recognition in relation to pensions, benefits, taxes, and inheritance rights. In terms of authority, it includes: access to a partner in health and social care facilities; rights to participate in decision making about a partner's health and social care; inclusion (where possible) in a partner's end-of-life plan; and, after a partner has died, full participation in their funeral arrangements. In terms of social networks, it also means being recognized by legal and financial organizations as a key player in a loved one's life, being recognized as the most significant person by health and social care staff, and being recognized as a bereaved spouse after a partner has died, and afforded all the informal and formal social support that a heterosexual widow or widower might receive.

By contrast, in those (many) countries where limited, or no, same-sex partnership recognition is available, few or any of these rights and privileges are enjoyed, and this can have devastating consequences in older age (Knauer, 2009). This can include material and financial losses, such as lack of welfare benefits or pension entitlements and even loss of one's home upon a partner's death (if it is inherited by biological family in cases of intestacy). It can mean being denied access to a partner in hospital or a residential care facility, even not being told where a partner has been placed at times; it can involve not only being excluded from medical decision making and end-of-life-planning, but being prevented from being with a lifelong partner when they are dying. After a death, the bereaved partner who is not recognized in law and/or society can be excluded from their loved one's funeral. It can involve a lack of recognition, support, and social validation for a bereaved partner, leading to 'disenfranchised grief,' which can result in depression and other mental health problems (Almack et al., 2010). Overall, the less legal recognition available to same-sex couples, the more these potential compound problems associated with older age are for older LGBT who are in partnerships.

Recognition of Nonconjugal Relationships

For many older LGBT nonconjugal relationships, 'families of choice' (Weeks et al., 2001) are of central importance. Current law and social policy, even in those countries where there are LGBT rights, privilege the conjugal couple, biological and filial relationships, leaving friendship on the margins of regulatory recognition (Westwood, 2013). While in those countries where there is freedom of testation (i.e., an individual can determine who inherits their estate), LGBT individuals can and do mobilize wills to ensure their families of friends inherit their estates if they wish them to. However, this is not possible in those countries where there is no freedom of testation. Even where it is possible, the economic resources required for adequate legal testation are not equally available to all LGBT's (Heaphy, 2009), and where there are disputes, or in cases of intestacy, the courts are likely to take a heteronormative perspective on the deceased's likely testatory wishes. Moreover, older LGBT people often use powers of attorney to ensure their LGBT networks can represent them, but there is variable recognition and respect for this in differing socio-legal contexts (Westwood, 2013). What this means is that while in some countries families of friends will be included in health and social care contexts, in terms of access, being provided with information, and being included in decision making, in other countries they will not. Worst-case scenario, very close friends may be denied contact with one another even at the point of death, particularly if biological family object (Knauer, 2009).

Because of the voluntaristic nature of friendship, there are mixed views about its recognition and regulation in law. However many people wish to see flexible forms of relationship recognition (Westwood, 2013). These would in particular benefit older LGBT whose significant relationships go beyond the conjugal family form. However, for a significant number of older LGBT people, loneliness and isolation, and having very

few people in their social network, is a more pressing issue. This will be explored in the following section.

Health and Well-Being

Effects of Discrimination

The overall health and well-being of older LGBT people needs to be understood in the context of lifelong exposure to direct and indirect discrimination. Older LGBT people are highly likely to have experienced the cumulative effects of 'minority stress,' i.e., lifelong navigation of minority identities and associated stigma and social marginalization (Kuyper and Fokemma, 2010). This in turn has impacted their physical and mental health both directly, and indirectly, i.e., in terms of lifestyle factors which may predispose them to ill-health (e.g., use of alcohol, obesity, etc.). Additionally, when older LGBT people do need to access services they may be reluctant to do so because of concerns about heteronormativity, homophobia, and biphobia among health and social care providers. This in turn can delay or impair the benefits they might gain from those services (Stonewall, 2011; McNeil et al., 2012).

Physical Health

Very little is as yet known about the specific health needs of older LGBT people. Some extrapolations can be made from health care research relating to younger LGBT people, and there is a small amount of older-age-related research beginning to emerge. In terms of physical health, older lesbians and bisexual women are less likely to engage with health screening for women because of concerns about prejudice and discrimination. This means that lesbians and bisexual women are more likely to be diagnosed later with women's health problems, including breast cancer and cervical cancer, and as a result have less positive outcomes in the treatment of those conditions (Hunt and Fish, 2009). There is no reason to think that older lesbians and bisexual women are any less likely to follow this trend, and additionally some may have lifestyle issues (e.g., more likely to drink alcohol, smoke, be obese) which predispose them to increased health risks (Musingarimi, 2008).

Older gay men are often marginalized from physical health care for men in general and feel that there is an overemphasis on sexuality and health in terms of gay men's health care, to the detriment of other health issues in later life (Clover, 2006). Moreover, much of that sexual health work is geared up toward younger gay men even though high rates of risky sexual behaviors are found among older gay and bisexual men, suggesting the need for more targeted, age appropriate, health education (Klein, 2012). Due to improvements in medical treatment, many more gay and bisexual men are aging with HIV, yet at the same time their aging cohort has been decimated due to the period when the disease was out of control and many of their peers had died. As a result, they are likely to require additional support in terms of adjusting to aging with HIV (Rosenfeld et al., 2012).

There is still much to be learned about trans health issues (Fredriksen-Goldsen et al., 2013a). Transsexual individuals who have undergone gender reassignment may have associated complex health needs (Cook-Daniels, 2006). Long-term hormonal treatments can lead to both health benefits and health risks. A male-to-female trans woman may also be vulnerable to certain health risks associated with a man's body (e.g., prostate cancer). Similarly, a female-to-male trans man may be at slight risk of health problems associated with a woman's body (e.g., breast cancer, even if the breasts have been removed). Prosthetics (e.g., testicular implants, penile prosthetics, breast implants, and artificial vaginas) may wear out and require replacement and some hormonal treatments can clash with treatments for certain medical conditions.

Mental Health and Well-Being

Lesbians and gay men are at higher risk of mental health problems than the general population (Fredriksen-Goldsen et al., 2013b). This particularly applies to those in the upper age ranges and even more so to older gay men (D'Augelli and Grossman, 2001). Key factors are both the cumulative effects of 'minority stress' and increased likelihood of loneliness and isolation (Kuyper and Fokemma, 2010). Loneliness and isolation impact upon emotional and mental well-being, and are, in particular, risk factors for depression. For gay men in particular, very often their social networks have revolved around commercial resources (e.g., club, restaurants, bars, and pubs) commonly available to gay men. These resources are increasingly youth-orientated and not inclusive of older gays, thus older gay men are more likely to lose access to the resource-based social support network; this is less likely to occur among older lesbians since their relationships are more likely to be based on noncommercial resources (Knocker et al., 2012).

With increasing social acceptance in some countries, growing numbers of previously heterosexually married individuals, particularly women, are forming same-sex relationships in later life. Accessing informal LGBT social networks may be a challenge, as they have not built up links via those networks earlier in their lives (Cronin and King, 2013). Thus while on the one hand, because they are more likely to have children and grandchildren, they enjoy greater intergenerational support, on the other, they may feel marginalized from LGBT communities, even those which do have spaces for older people.

Trans older people also report a mixed experience in terms of mental health and well-being (Fredriksen-Goldsen et al., 2013a). Some are socially well-connected and, particularly for those transsexuals who have transitioned in later life, report an increasing sense of well-being associated with increasing congruence with their gender. However, there are also strong indications that among older trans people there are increased risks of long-term depression compared with both the general population and with LGB people, while at the same time an avoidance of psychiatric services because of the conflation of trans identities and lifestyles with psychiatric disorders (Fredriksen-Goldsen et al., 2011). Again, social connection and social support play a key role in older trans individuals' well-being.

Health, Housing, and Social Care

In terms of health and social care provision (e.g., medical care, home care, community care, day care, residential care, mental

health services, dementia care, and end-of-life care) research indicates that these services are based on an assumption that older people are asexual or heterosexual and as such are underprepared to meet the needs of older LGBT people and may hold prejudiced attitudes toward them (Ward et al., 2011). As prejudice based on sexual orientation is most prevalent among the oldest older in the general population (Valentine and McDonald, 2004), older LGBT are particularly vulnerable to exposure to prejudice among fellow services users who comprise that age group. As a result, older LGBT people are concerned about prejudice, discrimination, bullying, and harassment in care contexts, not only from staff but also fellow service users (Stonewall, 2011; AGE Platform Europe and ILGA Europe, 2012).

Many lesbians and gay may have heightened sensitivities due to having been treated when younger as mentally ill, criminal, and/or sinful (River and Ward, 2012). Older LGB people who have lived hidden lives, are worried about being exposed by their own or a loved one's care needs. By contrast, those who have lived more open lives, are concerned about having to hide their sexual identities in later life in order to stay safe (Stonewall, 2011). Many trans people are concerned about transphobia, and for those who cross-dress, the lack of space and opportunity in care homes to do so (Auldridge et al., 2010). Transsexual people are concerned about how carers will react when providing personal care, e.g., if the trans person's body does not align with her or his gender performance (e.g., some trans women still have a penis, need to shave, etc.) (Age UK, 2010).

Many older LGBT people would benefit from access to sheltered housing. However, research suggests it is not geared up to their needs (Auldridge et al., 2012). The Stonewall survey found that three in five older LGB did not feel confident that housing providers would be able to understand and meet their needs (Stonewall, 2011). As a consequence, many want LGBT/lesbian- or gay-specific housing. There are only a small number of such projects at present, in the United States, Spain, and Australia (Carr and Ross, 2013). What is clear is that there should be a menu of housing choices for older LGBT people.

There is an urgent need to improve both housing and care services for older LGBT people. While there are some emerging specialist community support projects for older LGBT (e.g., Opening Doors in the UK, Knocker et al., 2012, and SAGE, in the United States, Kling and Kimmel, 2006) they are few and far between. Such support needs to be far more widespread and easily accessible.

Summary

Older LGBT people have spent most of their lives in an atmosphere of discrimination. For some living in those parts of the world where they live in fear and hiding, aging only serves to exacerbate vulnerability and marginalization that they have long experienced. Even among those living in more liberal parts of the world, the majority of their lives have been informed by an environment of discrimination and its effects on their current physical, mental, and social well-being. Among those who have seen tremendous social change in recent years, and growing acceptance and legal/social inclusion, there is an increasing expectation of equality in service provision, which is not yet met in age-related health housing and social care contexts. It also informs the services, which are available to them in later life, and their reluctance to engage with those services as a result. There is a need for choice in provision, with both LGBT-friendly mainstream services *and* LGBT-specific services on offer. There is also a need to address ageism within and among LGBT individuals and collectives, and to encourage greater reciprocal intergenerational support between younger and older LGBT individuals.

Lesbian, Gay, Bisexual and Trans-sexual Butch-Femme Subcultures

Julia A Puckett and Heidi M Levitt, The University of Massachusetts, Boston, MA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

The terms butch and femme refer to two gender identities that are rooted in sexual minority women's communities. Butch and femme can be descriptions of gender expressions as well as gender identities. Within this article, the origins of these identities are reviewed, as well as the ways in which they have changed over time. Research on butch and femme identities, relationships, and experiences of discrimination is reviewed as is methodological issues related to this research.

For many decades, popular cultures have stereotyped lesbian women as being masculine in appearance and mannerisms. Lesbians were assumed to be imitating men or desiring to be them and this understanding was used to condemn lesbians as 'not real women.' This charge ignored the fact that there was much more variation in gender expression among lesbians than was suggested by this stereotype. In addition femme women, who were not masculine in their gender presentation, were often not seen as real lesbians. This article describes the construction, history, and variations in butch–femme subcultures within lesbian/bisexual communities, but first there is a need to establish how terminology will be used.

When discussing the meaning of gender within the lesbian/bisexual community, a few definitions are helpful as many of the key terms are commonly conflated in writing, research, and everyday language. *Sex* refers to whether someone is male, female, or intersex biologically, whereas *gender* refers to socially constructed clusters of traits that tend to be associated with differences in sex, such as masculinity and femininity. In addition, *gender expression* describes the sets of symbols and signifiers (e.g., symbols of masculinity such as a suit or short-hair) that come to be associated with genders in a given culture (e.g., Butler, 1990). Butch and femme are two gender identities within lesbian/bisexual communities. Generally speaking, butch is used to refer to sexual minority women who are more masculine in their gender expression and femme is used to refer to sexual minority women who are more feminine in their gender expression. The meanings of these identities, however, may shift when considering different time periods, locations, and communities at hand as described here.

History and the Evolution of Butch–Femme Communities

Within the gay, lesbian, bisexual, and transgender communities, different subcultures and identities have evolved at different times in relation to political and cultural social changes (e.g., Faderman, 1991; Levitt, 2006). Butch and femme gender identities came to be claimed by some lesbian and bisexual women starting in the 1930s and became more common in the 1940s (Kennedy and Davis, 1993) as societal shifts in women's gender expression were taking place. At the beginning of this period, there were more restrictive gender roles for all women than there are today and it was uncommon for women to violate traditional gender norms for clothing, such as by wearing trousers (Kennedy and Davis, 1993). While sexual minority women were often not visible in these earlier times, the 1940s gave rise to a number of establishments and bars that catered to working-class lesbian and bisexual women, and so a sense of community and connections between sexual minority women developed, which contributed to the growth of butch and femme communities during that time (Burch, 1998; Kennedy and Davis, 1993). Through these communities, butch and femme gender identities gained in recognition at the same time as images that promoted lesbian visibility were popularized. Though there was increasing lesbian visibility, the social context of lesbians and bisexual women during this period dictated to a large extent the way that they socialized. For instance, private house parties were more common at the time for upper-class lesbians and bisexual women and in the Black lesbian/bisexual community.

The period during and after World War II was marked by greater independence for women and provided them with more freedom in their gender expression (Kennedy and Davis, 1993). For example, it became more socially acceptable for women to wear pants instead of skirts or dresses. Although butch women typically still had to wear more feminine clothing for work because of social norms, they dressed as butch when out at lesbian bars. Butch women emphasized wearing clothing such as suits, ties, vests, and starched shirts, whereas femme women emphasized wearing fashionable clothing, makeup, and heels. In addition, while cutting one's hair short has often been a significant marker in the representation of butch women, in the 1940s there was greater fear that this would result in being fired from one's job which meant that few women were able to cut their hair short (Kennedy and Davis, 1993).

Just as mainstream gender expressions shift across generations, butch and femme women's gender expressions have responded to the cultural images of their time. For example, these women adopted masculine and feminine gender expressions that were similar to then-popular media figures (e.g., James Dean, Marilyn Monroe). Their gender identities were signified in their appearance, mannerisms, and behavior, including the types of clothing they wore, their haircuts, and their interpersonal dynamics, which included their sexual relationship roles (Kennedy and Davis, 1993; Kraus, 1996). Throughout the 1950s, butch women increasingly dressed in clothing similar to working-class male garb (e.g., sweaters, T-shirts, suits; Kennedy and Davis, 1993). This appearance

became a hallmark of sexual minority status for butch women and came at the cost of reduced job security, which was an issue femme women did not face as often (e.g., Nestle, 1992).

These gendered identities and associated gender expressions created a new subculture of lesbians and bisexual women who were organized to resist the heterosexism in the mainstream heterosexual culture (Faderman, 1991; Kennedy and Davis, 1993). For butch women, their gender expression was read by others within the broader community as signifying their identity as lesbian, while also challenging the gender norms often assigned to females (Kraus, 1996). Femme women's identities as lesbians often became visible when in the company of butch women and their decisions to partner with butch lesbians challenged the idea that lesbians had to be masculine (Nestle, 1992; Kraus, 1996). The public visibility of these lesbian and bisexual women led to dangers such as police harassment and brutality (Kennedy and Davis, 1993), and to having their names listed in newspapers when lesbian bars were subjected to police raids – which could lead to public shame and social rejection (Faderman, 1991). Within the community, butch and femme women often supported one another in resisting this marginalization and would both verbally and physically defend one another (Kennedy and Davis, 1993).

Although not all sexual minority women adopted a butch or femme identity, most did because these were the popular gender aesthetics at the time and so social and dating dynamics were organized in relation to these identities. These dynamics broadened the gender expressions permissible for women and also acted to create public visibility for sexual minority women. Although this pairing of masculine and feminine genders might resemble heterosexuality at a glance, historians have highlighted that butch–femme dynamics challenged the more traditional images of women and feminine gender that were typically marked by passivity (Kennedy and Davis, 1993; Kraus, 1996).

There were many ways in which these gender identities differed from heterosexual genders and the types of privilege they entailed were markedly different. Butch women often had difficulty in gaining or maintaining employment, because their gender expressions readily identified them as lesbian, so often their femme partners were the more financially successful member of a couple (Kennedy and Davis, 1993; Nestle, 1992). Also, butch women were not raised with male privilege and so the adoption of signs of masculinity had a different meaning than for men, for whom social power was often natural and unconscious. For instance, if femme women allowed their butch partners to pay for meals (even when they gave them the money first), it was a decision they made to affirm their partners' butch gender within a profoundly heterosexist context that subjected butch lesbians to great discrimination, rather than a passive acceptance of benevolent sexism. To provide another example of how these gender identities had distinct features, sex for butch women was focused on satisfying femme women and there was social pressure for butch women to be 'stone' – meaning that butch women would gain physical pleasure themselves only via tribadism and refrain from nudity or other types of sexual contact (Kraus, 1996). This sexual interaction allowed both partners to be pleased while affirming their internal sense of their gender (Levitt and Hiestand, 2005).

Just as in many contexts with gender norms, in past times it was easier to be accepted and form relationships if lesbians and bisexual women were read within butch or femme gender identities, thus some women felt marginalized if they did not fit neatly into the categories of butch and femme (O'Sullivan, 1999). While women that did not identify as butch or femme felt marginalized at times, femme women have also reported feeling marginalized within lesbian spaces although this may have varied across racial and ethnic communities. For example, while butch women often were positioned as leaders within White lesbian communities, femme women played a more central role within the Black lesbian community (Kennedy and Davis, 1993).

According to Burch (1998), around the 1960s, androgynous gender expression became more common among lesbians because this expression was seen as more egalitarian within the second wave of feminism that promoted equality by challenging gender differences. Lesbian feminists came to see butch–femme relationships as imitations of heterosexuality. Butch women were thought to be seeking male privilege and femme women were thought to be supporting the sexist objectification and treatment of women. Although portions of the butch and femme communities vocally took issue with this interpretation of their gender expressions as patriarchal (Faderman, 1992), as this thinking came to dominate many lesbian communities in the 1970s, butch and femme women were seen as suspect and many butch/femme women either changed their gender expressions or went underground. These changes, however, were not equal across communities, butch and femme identities remained more common within racial and ethnic minority and working-class sexual minority communities (Crawley, 2001; Faderman, 1992; Moore, 2006).

Butch and femme gender identities began to be reclaimed in the 1980s and 1990s, but there were new understandings of these gender identities. Although some continued to think that these expressions were not egalitarian and degraded women, others believed that lesbians should embrace and explore their genders and sexuality (Burch, 1998; Levitt and Hiestand, 2004). After the second wave of feminism, gender itself was thought to be more fluid and, similarly, sexuality and gender expression within the lesbian community became more flexible. As Burch (1998) states, "a woman might be both butch and femme, alternately or in combination" (p. 362). In addition, butch and femme were no longer single identities and instead, there was a pluralism of butchness and femmeness (e.g., stone butch, baby butch, aggressive femme, etc.) that greater diversified the gendered presentations and partnering of sexual minority women (Faderman, 1992). Also, in some communities, such as the Black lesbian community, new gender identities were claimed as well. Instead of using identifiers such as butch, Black lesbian women may be more likely to claim identities as aggressive or studs (Moore, 2006).

Current Understandings of Butch and Femme Identities

Writings about butch and femme identities have flourished over the last two decades, including personal narratives (e.g., Newman, 1995), theoretical essays (e.g., Munt, 1998), and

research studies (both qualitative and quantitative; e.g., Levitt and Hiestand, 2004; Levitt et al., 2012). Current writings on the topic of lesbian genders have taken a variety of approaches, with some seeing butch and femme genders as having a biological basis (e.g., Pearcey et al., 1996; Singh et al., 1999), some describing these genders as rooted in performance (e.g., Butler, 1990), and others citing the intersection of biological and social forces (e.g., Levitt, 2006).

Research on Butch Identity

Qualitative research on contemporary butch and femme identities can be helpful in developing an understanding of these women's experiences of their own gender identities. Findings from a couple of these studies are summarized here to describe some common developmental experiences (Levitt and Hiestand, 2004; Hiestand and Levitt, 2005). In their qualitative analyses of butch lesbian's stories about their gender identities, the researchers found that butch participants viewed their identities as essential to their sense of self-beginning at an early age. These women reported being butch before they had a word for it. They described themselves as having a masculine energy and essence, one that had shared characteristics with men even though they still identified as women. These women reported having a sense of being different from most girls that could result in their feeling isolated at times. Also, many of the women reported that others picked up on this difference and called them names or teased them, especially once junior high school commenced and they no longer passed as tomboys. Often puberty was experienced as a stressful time as their boyish appearances changed and their bodies seemed to be betraying their internal sense of self. Some of the participants reported pressures to conform to a feminine gender expression and to feign interest in dating men.

They reported eventually entering lesbian communities where they found interpersonal acceptance and a space to explore their sexual orientation. Other butch-identified women provided models of acceptance and pride for their gender, and sometimes mentored the participants as they learned the social meanings associated with butch identity. Also, femme women showed them that their butch gender expression was attractive and sexually desirable – which was a transformative idea for some. Community stereotypes about butch gender could be restricting at times, although many of the participants reported embracing both aspects of their gender that were supported by a butch stereotype along with aspects that were not seen as intrinsically butch.

Research on Femme Identity

Similarly, qualitative interviews of femme lesbians can provide an understanding of the types of experiences associated with this gender. Levitt et al. (2003) asked femme interviewees to describe their process of developing their gender identities. The women interviewed reported that they saw their femme gender identity as a core part of themselves. Their development of a femme identity was complicated because of what this identity meant for them when navigating heterosexual and lesbian spaces. Through their youths, most participants reported that they did not match the stereotypical images of lesbians (i.e., butch or androgynous women), which sometimes prevented them from seeing themselves as lesbians until later in life. Also, these stereotypes taught them that real lesbians should be attracted to feminine women, which did not fit for them either since most femme women reported to be attracted to more masculine women. However, when entering into lesbian communities, they were able to embrace their sexual minority identities. Also, they could further the development of a desirable butch aesthetic in others that could overcome the negative societal view of butch or masculine women. Some femme interviewees, however, reported experiencing some marginalization from within lesbian communities, and that their sexual minority identities were sometimes questioned because of their gender expressions.

Also, the participants reported having difficulty being recognized as lesbian by other lesbians and thus often needing to verbally disclose their sexual minority identities. Although they experienced this as challenging at times, they also found that their gender expression could permit them a different type of activism. While butch women created more lesbian visibility, the femme women thought that heterosexist people might become more comfortable with them initially because of their feminine appearance and then might be more receptive to learning about their lesbian identities. These themes from research on femme identity echo personal narratives that have also been written by femme lesbians (e.g., Coyote and Sharman, 2011; Harris and Crocker, 1997; Newman, 1995; Rose and Camilleri, 2002).

Intersectionality and Butch/Femme Identities

While this account centers upon the changing of butch–femme communities in the United States, it should be noted that similar identities and communities have existed in other regions as well. For example, the T-Po community in Taiwan has been described as a butch–femme community that began in the 1960s (Chao, 2000). Similar genders have been developed in places such as China (e.g., Zheng and Zheng, 2013), Israel (e.g., Luzzatto and Gvion, 2004), and Latin America (Esquibel, 2003) – often with unique twists and meanings associated with these genders.

Most research exploring butch and femme identities has focused on the experiences of White sexual minority women. More recently, research has started to examine the experiences of racial and ethnic minority women. For example, within the Black lesbian community, there are a variety of identity labels that are not represented within White lesbian discourse, such as 'stud' and 'aggressive,' which categorize women who may be labeled as butch within White lesbian communities (Wilson, 2009). In addition, Black lesbians may claim labels anywhere along the gender spectrum, such as hard stud (similar to a stone butch within White lesbian culture), or may reject these gender identity labels (Wilson, 2009). While research is starting to examine the intersection of race and lesbian identity, this is also being done within the media. For example, the documentary U People (Demetrius and Walidah, 2009) explores gender identities within a Black lesbian community in New York.

Turning to sexual orientation itself, preliminary research in a large national survey of sexual minority women addressed the intersection of sexual orientation and butch–femme genders.

In that research, femme women were much more likely than butch women to identify as bisexual, while butch women were found to be almost exclusively lesbian identified (Levitt and Bridges, 2007). Additionally, butch women appeared to be more attracted to feminine women while femme-identified women reported a stronger preference for their partners to be more masculine.

Historically, social class has been related to butch–femme identities within lesbian communities, with these two identities more common among working-class women (Kennedy and Davis, 1993). In addition, butch and femme cultures originated in bars that catered to working-class lesbians (Faderman, 1991). More recent research has found that social classes, including income and education, are predictors of whether women claim identities as butch and femme but also have found increased diversity of class status than reported in these earlier generations (Weber, 1996).

Relationships within Butch–Femme Subcultures

Historically, butch and femme women have been expected to partner with each other (e.g., Faderman, 1991). While butch and femme women have been expected to desire one another, some women desire women of the same gender identity as themselves (e.g., butch–butch relationships) and not all women within the sexual minority community identify as butch or femme (Levitt and Hiestand, 2005). Defining these women's gender based on their partners alone can marginalize women attracted to similarly gendered others (i.e., a butch woman attracted to other butch women; Hemmings, 1999; Inness and Lloyd, 1995).

In a qualitative study, Levitt and Hiestand (2005) examined sexuality within butch and femme lesbians. Through the grounded theory analysis, results revealed that participants' romantic relationships often were structured around valuing their gender differences. Butch women were empowered in their ability to seduce and be desired by femme women. Knowing the social marginalization that butch women encountered, femme women could demonstrate their support for their partners' gender identity by allowing them to take on the interpersonal mannerisms traditionally associated with heterosexual men. Playing with their differences via flirtation served to validate each other's gender identities that were marginalized in different ways by mainstream or lesbian communities while increasing their reciprocal desire. For femme women, being read as lesbian when with butch women was experienced as positive and was in contrast with their sexual minority identities usually being misperceived as heterosexual within heterosexual spaces (Eves, 2004).

While there have been other studies on partner preferences in butch and femme women, most have suffered from methodological limitations. For example, many have relied on using personal ads as data. These studies have shown that women may prefer other women who describe themselves as more feminine, regardless of whether they identify as butch or femme (Bailey et al., 1997; Smith and Stillman, 2000). Even so, there are various issues that impede interpretation of these results, including the potential of having biased samples. As Smith and Stillman point out, butch women are more visible as sexual minorities because of their gender expression, whereas femme women often are read as being heterosexual. This misreading may result in women who desire femmes using personal ads as a way to meet partners because of the difficulty in identifying femme sexual minority women. It also may result in inaccurate interpretations that sexual minority women desire only feminine or femme women. Other studies have forced participants to identify as either butch or femme (e.g., Bassett et al., 2001) and neglected the diversity of gender present in sexual minority communities.

Discrimination and Psychological Research on Butch–Femme Women

Research has shown that individuals who conform less to the expected male and female gender norms are generally viewed more negatively by others and are less accepted (Horn, 2007). Along with being viewed more negatively, butch women are more likely to encounter heterosexist events, such as discrimination and harassment, than femme-identified women (Lehavot and Simoni, 2011; Levitt et al., 2012). Even though sexual minority women with more masculine gender expressions or those who have butch identities experience more heterosexism than feminine or femme women, some research has found that butch women do not have worse mental health outcomes (Levitt et al., 2012). This resiliency may be the result of butch women's stronger connections to the lesbian community and their being more out, which might buffer the negative impact of heterosexism on mental health (Levitt et al., 2012).

In contrast, some research shows that there are differences between mental health for butch and femme women, but that the higher rates of experiencing heterosexism explain these relationships (Lehavot and Simoni, 2011; Rosario et al., 2008). While femme women may encounter less heterosexist events, they may encounter minority stress in other ways, including having higher levels of internalized heterosexism that may result in negative mental health outcomes (Lehavot and Simoni, 2011). More research is needed to understand these different findings on the impact of heterosexism on mental health and well-being in butch- and femme-identified women, as well as the potential buffering impact of claiming these identities and belonging to butch–femme communities.

Methodological Issues Related to Butch–Femme Research

One of the major methodological issues related to research on butch and femme identities is how these identities are ascertained. Some research relies on participants' self-identification, while other research has had participants rate their gender expression on a continuum from butch to femme or from masculine to feminine. For research that uses a continuum, there is also diversity in the ways this is approached, with some assessing gender on one scale with masculinity and femininity on separate ends (e.g., Levitt et al.,

2012) or separate scales measuring butchness and femmeness (e.g., Singh et al., 1999). More recently, scales are beginning to be developed to provide a multifaceted measurement of gender within sexual minority women instead of relying on single items (e.g., Lehavot et al., 2011).

Another major limitation of previous work is that, in large, it has focused on the experiences of White sexual minority women. This focus neglects the experiences of sexual minority women of color. More research is needed to understand fully the ways ethnic and racial minority women experience their gender expression and identities as butch or femme (as well as other gender identities that may be more common within their ethnic or racial communities). Also, with the emergence of transgender identities, the positioning of butch and femme identities has become more complex – with some writers seeing butch as a transgender identity (e.g., Feinberg, 1993) and others positioning butch and transmen in contrast to one another (e.g., Halberstam, 1998; Hale, 1998).

Conclusion

Within lesbian history, butch and femme identities have played an important role as they were the first lesbian gender identities that became publicly visible. These identities have continued to evolve over time, with the continual changing of gender roles in society. In addition, these communities allowed women to resist heterosexist oppression in the 1940s and 1950s and created more visibility for sexual minority women. The actions and resistance of these early generations left a legacy of community support that has bolstered community organizing in modern lesbian communities.

Abstract

Drag queens and drag kings have received a great deal of attention for their roles in the lesbian, gay, bisexual, and transgender (LGBT) community and movement. Their sexual and gender identities vary but most are gay men, lesbians, or transgender people who perform identities on the stage, which both depict and defy conventional binary gender and sexual categories. Drag queens and kings are distinct identity categories that have become integral to the contemporary understanding of gay and lesbian politics and communities. Recent scholarship raises questions about the political potential of drag. This body of research suggests, nevertheless, that drag performances are fundamental to the creation and maintenance of LGBT identity and community.

Introduction: Drag Queens, Drag Kings, and Faux Queens

At the most basic level, drag queens and drag kings are men, women, and transgender people who perform femininity, masculinity, or something in between. These categories, however, are not stable and encompass a wide range of bodies and enactments of gender. Typically, drag queens are conceived as male-bodied individuals who perform femininity, while drag kings are thought of as female-bodied people who perform masculinity. But not all men who dress as women or women who dress as men identify as drag queens or drag kings. Other categories include: cross-dressers (formerly known as transvestites, who are generally straight men who wear women's clothing for nonperformance related reasons); butch women (including some lesbians); effeminate men (including some gay men); preoperative transsexuals and transgendered people who display and embrace a gender identity at odds with their assigned sex category. (For more information, see Rupp and Taylor, 2003; Rupp et al., 2010).

There is a strong link between drag and gay identity. Despite the fact that not all drag kings and drag queens identify as gay and lesbian, most of them do. Some drag queens, known as 'tittie queens,' acquire breasts through either hormone treatment or implants but have no desire to live as women in their daily lives. While some drag queens incorporate transgender identities into their biographical narratives, most are male-bodied, self-identified, gay men, whose feminine personas are restricted to the stage. Drag kings are more likely than drag queens to embrace gender nonconformity as part of their sexual identity (Ayoup and Podmore, 2002). Rather than referring to themselves as lesbians, many drag kings account for their gender anomalies by identifying themselves as sexually 'queer' – an umbrella term for the nonheteronormative status. Although some drag kings are transgender men who adopt masculine drag personas onstage, most are female-bodied people who self-identify either as gender queer or as women, as well as either lesbian or sexually queer. Faux queens, also referred to as 'bio queens,' are generally female-bodied, woman-identified individuals, who perform femininity onstage and may be lesbian, queer, or straight.

The Early History of Drag

The meaning and substance of drag shifts drastically across cultural and historical contexts. Predating drag queens were the 'mollies' or 'queens' of the late seventeenth century in England. These individuals comprised a subculture of men who used feminine attire and mannerisms to express their same-sex sexual desires. In the early nineteenth century, however, this subculture was distinguished from the 'dame comedians' – men who performed as old women to elicit laughter. During the mid- to late nineteenth century, the term 'drag' was first used to describe men who wore women's clothing not only to elicit laughter but also to perform glamorous female roles in serious theater productions. This legitimated form of female impersonation was first made possible, in part due to the cultural and historical context in which these men were performing; at the time, women were barred from involvement in the theater and men therefore played both male and female roles on the stage. Use of the term 'drag queen' to describe female impersonators began in the 1930s and was generally linked with the presumed homosexuality of the men who were performing (for more information, see Rupp, 2001).

Drag expanded beyond the theater and began to play a central role in bar cultures in the US throughout the 1920s and 1930s. During the 1920s and early 1930s, Prohibition era speakeasies used drag performances to attract mixed (homosexual and heterosexual) crowds of middle class and working class audiences in many cities and in Harlem, drew mixed audiences of African Americans and 'Whites.' During this time, public drag balls offered homosexual men the opportunity to dress in women's clothing and dance with other men in mixed heterosexual and homosexual crowds. Prohibition era drag cultures expanded during the first few financially tenuous years of the Great Depression, as business owners struggled to solicit paying customers by featuring female impersonators in their clubs. This resulted in a short-lived 'pansy craze' in New York City's Times Square, as patrons flocked to see these shows.

But the pansy craze of the early Depression years was cut short when prohibition was repealed in 1933. The norms of law-abiding citizenry were reinstated and the government established regulatory control over liquor-serving establishments through agencies like the Liquor Control Board in New

York. New regulations included the ban on homosexual behavior in reputable establishments, which forced homosexuals and drag queens out of mainstream bars. Ironically, this exclusion led to the establishment of the first bars catering to homosexuals, which have subsequently become integral spaces for the development and cohesion of same-sex oriented subcultures and communities (for more information, see Chauncey, 1994).

Although generally relegated to same-sex oriented spaces following the 1930s, drag made a sanctioned appearance in the United States and Canadian militaries during World War II. Drag performances by male soldiers were an essential aspect of morale building among men, who served for long periods of time without female companionship. Although there is written history to suggest that some of the drag performers were so convincing that they warranted the romantic attentions of other soldiers, the specter of homosexuality never haunted these performers until women were recruited into the armed forces during the Second World War and took over the role of female entertainers. Although some performers were discharged for psychological reasons in Canada, it is unclear whether these reasons were related to accusations or instances of homosexuality. Moreover, there is no evidence that male performers were sanctioned in any way for their roles as female impersonators and some pursued drag after their enrollment in the armed forces (for more information, see Halladay, 2004).

Following the war, drag continued to flourish in the United States by catering to mostly straight audiences. For example, heterosexual tourists flocked to the reputably salacious city of San Francisco beginning in the late 1930s, to watch drag shows in bars that catered to homosexuals. Still, the postwar environment took its toll on drag performances. Wearing drag on the street was still illegal in many cities and female impersonators had to carry cabaret cards to prove they were performers. The range and expertise of female impersonators shifted again in the mid-twentieth century, when financial issues led to the use of prerecorded music and lip-synching in drag shows, allowing amateur performers to enter the drag scene in greater numbers.

Drag in the LGBT Community

Drag queens, as we currently conceive of them, achieved notoriety in the United States during the 1960s and 1970s. As police continued to harass patrons at gay bars, drag queens became explicitly political, using drag performances to raise public awareness of gay identity and support for gay rights. Although they played a key role in the gay liberation movement throughout the 1970s, drag queens were marginalized within the gay and lesbian community throughout the 1970s and 1980s, because their gender transgressions contradicted the claims to normalcy made by gay men and lesbians. As a result, drag queens and other gender rebels like butch lesbians and radical faeries took a pivotal role in the struggle against gender conformity in the gay liberation movement. This is when the visibility of drag queens as a public and integral force of the gay and lesbian movement increased. However, as transgender visibility increased in the 1980s and 1990s, so too did the stigmatization of drag queens, who were now seen in an even more deviant light (for more information, see McNeal, 1999; Berkowitz et al., 2007; Berkowitz and Belgrave, 2010.)

Even though drag queens have continued to face stigmatization based on gender nonconformity, drag can also be an empowering medium. Drag queens who perform for pleasure are more likely to experience stigma and marginalization than those who perform professionally. As drag queens become more established, they often earn high levels of prestige in the contexts where they perform – primarily gay bars and pride celebrations. However, the desirability of drag queens as entertainers rarely translates into their personal and romantic lives, as gay men often actively reject the idea of dating a drag queen. Thus drag queen performances can be interpreted as reflecting and challenging the "ambivalence of being gay and male in the United States," because they represent a moment where gay male femininity is "not stigmatized and ashamed, but in control and assertive, retaliating against a hegemonic straight world" (McNeal, 1999: p. 347).

Drag offers some performers a medium through which they can explore the nuances of their own sexual and gender identities (for more information, see Shapiro, 2007; Taylor and Rupp, 2004; Patterson, 2002). Drag queens and kings often explain that their drag personas and performances represent exaggerated aspects of their personalities that are hidden in their daily lives. Although drag and transgender identities are not the same thing, some transgender women and men use drag performances to express aspects of their gender identities, particularly in the process of exploring their own gender identities. Both queens and kings have expressed strong connections between drag personas and their personal sexual and gender identities. Some describe their entry into drag as being part and parcel of their own exploration of homosexuality and gender nonconformity. Drag kings in particular often explore their gender identities through performance, although many drag kings are butch women to begin with. As a result, questions of transgender identification are sometimes central to drag performers own identities. More often, however, drag performers, particularly drag queens, tend to deny this connection as a result of the stigma associated with being transgendered. Many drag kings and queens identify with the gender that they were assigned at birth, using drag specifically as a performative technique that is specific to their stage lives. It is common, however, for drag queens to move back and forth between the use of male and female names and pronouns, referring to themselves as 'she' even when they are out of drag.

Because of their roles as entertainers, drag queens and drag kings have opportunities to expand their community connections through performances at gay and lesbian functions. Drag communities can also foster a sense of belonging for individuals. Drag king troupes offer a nurturing environment for masculine women and transgender men, who face hostility and violence in the outside world. In some cases drag communities develop into fully formed family support structures, as is the case with 'ballroom drag.' Ballroom drag, a cultural phenomenon that originated in New York over 50 years ago, encompasses a variety of forms of drag that challenge categories of gender, race, and class (for more information, see Bailey, 2009). Members of the 'ballroom culture' are most often Black and Latino youth, who have been rejected from their communities of origin and subsequently form 'houses' with

one another, through which they sponsor competitive ball events. Each house has a 'mother' (and sometimes a 'father') who takes care of and trains the 'children' in the performance of drag. Drag mothers who teach the tricks of the trade, generally socialize drag queens into their identities. These familial structures provide a nurturing environment for queer people of color, primarily gay men and transgender women.

The Political Potential of Drag

During the 1969 Stonewall riots in New York, which sparked the modern gay liberation movement, drag queens and transgender women were among the most militant protesters against police discrimination and brutality toward gay communities. Earlier in San Francisco, drag queens and transgender women had already been actively engaged in resistance against homophobia in their neighborhoods; but much of this has gone unrecognized by scholars. However, the political role of drag queens and drag kings in gay and lesbian communities has warranted increased scholarly attention, with the rise of queer theory and the growing field of gender studies since the 1990s.

The primary assertion of queer theorists is that drag problematizes the understanding of gender as naturally attached to particular bodies and that the socially constructed nature of gender is revealed through drag (for more information, see Butler, 1990; Rupp and Taylor, 2003). Drag performers can also disrupt heteronormative notions of sexuality. When drag queens perform sexualized femininity for straight audiences, the desire elicited from straight men can destabilize heteronormativity. This is especially true when these same queens disrupt their performances of femininity by calling attention to the male bodies that are present underneath the sequins. This form of drag, known as 'camp,' reveals femininity as a performance.

Although drag has clear potential to disrupt gender and sexual norms, it can also be read as reifying gender stereotypes. Particularly in the context of their retained male privilege, drag queens are interpreted by some people as being misogynistic in their representations of femininity. This is highly prevalent in the case of camp, where drag queens exaggerate femininity to a comedic scale. Since the 1990s, questions have emerged regarding the transgressive potential of drag kings who exemplify the superfluous attachment of masculinity to male bodies. However, unlike drag queen camp, there are limitations to the enactment of parody in drag king performances, due to the understated nature of masculinity in the US culture. It can be difficult to caricature a gender, which is so dominant that it seems culturally invisible. At the same time, the taboo on parodying masculinity can be an incredibly effective form of resistance, since it is socially less acceptable than ridiculing or making fun of femininity.

Despite gendered differences in the ways that drag queens and drag kings perform gender, they both undermine normative distinctions and ideas about gender and sexuality. Drag queens are essentially male-bodied and this affords them some privilege compared with drag kings who, although they are performing masculinity, are usually female-bodied. Drag queens use this authority to engage antagonistically with audience members, particularly straight men. Sometimes they exert superiority over women by claiming that they are better at 'doing femininity' than real women; but drag queens also engage playfully with heterosexual women with whom they have amicable rapport. More often, they attempt to arouse desires in members of the audience that are outside of their expressed sexual identities. Through the arousal of desire across lines of gender and sexuality, drag queens seek to blur and destabilize distinctions between heterosexuality and homosexuality (for more information, see Rupp et al., 2010; Taylor and Rupp, 2006; Rupp and Taylor, 2003).

Drag kings, on the other hand, often challenge sexual and gender norms through the explicit enactment of multigendered desires on the stage. Particularly in drag troupes where the kings emphasize group numbers, the performers interact with one another to execute scenes that contain instances of gay male sexualities, butch/femme sexualities, and butch/butch sexualities. Through such performances, drag kings offer a relatable space for both performers and audience members to explore multiple embodiments of gender and desire, representing the varied and complex sexual identities and dynamics that characterize contemporary lesbian communities.

Scholars have raised questions about the ways that drag performances might also denaturalize race, class, and sexual categories (for more information, see Rhyne, 2004; Muñoz, 1999; Volcano and Halberstam, 1999). Intersectionality is a theory that acknowledges that race, class, sexuality, and gender cannot be understood as a collection of isolated categories, because they intersect to create unique experiences and identities (Crenshaw, 1989; Collins, 2000). When drag queens and drag kings of color incorporate aspects of their racial and ethnic cultures into performances, they make visible their intersectional identities on the stage and challenge 'taken for granted' notions of gender that are informed by white norms. Through these performances, drag artists illuminate the ways that gender and race intersect to create different meanings associated with masculinity and femininity for people of color (For more information, see Muñoz, 1999). White queens also illuminate the ways in which gender norms are racialized to privilege 'whiteness.' This is particularly true in the case of the 'camp aesthetic,' where white queens perform femininity in ways that illuminate the socially constructed nature of proper and constrained, white, middle class, femininity through exaggerated performances of hypersexual, excessive, and trashy white femininity.

Kings tend to more explicitly address racialized performances of masculinity in their discussions of social justice. Still, the masculinities performed by drag kings are often middle class and racialized extremes of masculinity, leaving middle class white masculinities more or less unchallenged. Still, drag kings have the potential to embody an intersectional approach to queer politics on stage. The different performative approaches taken by white kings and kings of color express differences in their investments in queer and racial politics. For example, Dre, a black king who performs black masculinity onstage, does so as homage to alternate forms of black masculinity, challenging racist discourses about hypersexualized and aggressive black men. Black kings and other kings of color are less likely to make an outright mockery of masculinity than white kings. At the same time, when white kings perform white

masculinity, they often do so in ways that exaggerate whiteness and the ways in which it is tied to particular forms of dominant masculinity (for more information, see Crowley and Teach, 2002; Pauliny, 2002; Volcano and Halberstam, 1999).

The politics of drag can also move beyond the stage, to the context of everyday life. For example, Diane Torr's 'Man for a Day Workshops' take drag to the streets, as she trains lesbians, straight women, gay men, and transgender men in the subtle nuances of masculine embodiment (Torr and Bottoms, 2010). Through this process, she unmasks the 'taken-for-granted' power of masculinity and the male-bodied and demonstrates that literally anyone can do it. Drag kings, who must learn to adopt the understated embodiments of men on the stage or who are already masculine or butch, are often mistaken for men when out of drag. Conversely, drag queens are not generally mistaken for women when they are out of costume; and many of them are quite masculine when not in drag. But this does not mean that they do not bring the politics of drag into the streets. In Berlin, *Tunten* are men who dress in drag to challenge normative gender expectations through the exhibition of mundane and trashy femininities both on and off stage. *Tunten* are part of a stigmatized subcultural community that engages in explicitly expressed political activity, contrary to their glamorous drag queen counterparts whose impersonations of celebrities warrant them a great deal of prestige in the contemporary gay community of Berlin, which emphasizes cosmopolitan consumerism and individuality (Balzer, 2004).

Conclusion

Many drag performers view their own performances as explicitly political, while others see their performances as mere entertainment. As we have argued, the political potential of drag is highly contingent upon place and space, as well as on how the audiences receive performances. Despite these caveats, drag can be a politically potent medium when performed for both homosexual and heterosexual audiences. On stage, drag kings and drag queens are contextually normal rather than deviant, allowing them to engage with heterosexual and homosexual audiences and both men and women, from a space that is temporarily privileged rather than marginalized. In short, for both drag queens and kings, the political intentions and outcomes of their performances are highly contextual.

Lesbian, Gay, Bisexual and Trans-sexual Minorities in International Perspective: Overview

Don Barrett, California State University San Marcos, San Marcos, CA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article provides a discussion about the origin and goals of the Lesbian, Gay, Bisexual, and Transgender (LGBT) and sexual minority section of the encyclopedia, the importance of terminology that is inclusive of all of those who are same-sex involved for achieving those goals, and the need for an international perspective on these issues. This article also includes a description of the creation of the section, and discussion of four themes that appear across the articles: social construction of sexual minority categories; patterns of cultural discrimination; discrimination: consequences and responses; and future directions.

Scholarship on the lives of those who are sexually active with same-sex others has increased tremendously since the rapid expansion and visibility of the modern gay movement in the 1970s. For many of those years, the main focus of the scholarship has been on the middle-class white gay male Western populations and communities that were accessible, limited by discrimination, and likely to benefit positively from research. Same-sex sexual activity, however, is not something that occurs only in Western cultures or only among those who, other than their sexuality, would be among the country's politically and socially dominant population. Given the lower availability of scholarship on those same-sex active minorities who are less visible, a driving goal in the creation of this section in the encyclopedia was to provide users with an opportunity to view and compare scholarship on the experiences of the less visible sexual minorities with the scholarship on those who have been most studied.

To reinforce the importance of giving weight to the experiences of the less visible same-sex involved, this overview uses the term 'sexual minority' as a general term and reserves the use of the terms 'gay' or 'LGBT' for specific instances. Though public discourse and much of scholarship uses the terms 'gay' or 'LGBT' to refer to people who are same-sex involved, this article and the articles in this section highlight the extent that those terms hide important differences in both same-sex involvement and in societal responses to such involvement. The articles thus illustrate the value in using approaches that are not restricted by a term laden with multiple and confusing social meanings. By often questioning the assumptions placed on the use of 'gay' or similar common terms, and by drawing attention to experiences internationally, the articles in this section highlight the breadth of sexual minority experiences, the social limitations placed upon them, and their reactions to those limits.

Creation of the LGBT and Sexual Minority Section

While it would have been desirable to have articles from scholars from diverse countries, even the process of finding available authors reflects the influence of Western scholarship on sexual minority research. Probably due to greater acceptance of sexual minority scholarship in Western cultures, quite often even the authors who were studying sexual minorities in non-Western countries were affiliated with a university in a Western country. Due to this situation, the majority of authors are from four English language Western countries (Australia, Canada, the United Kingdom, or the United States) though there are additional authors from China, South Africa, and Turkey. Despite the Western and English-language affiliations of the authors, the articles in the section range farther afield covering sexual minorities in South Africa, the Maghreb region of North Africa, Turkey, China, Latin America, Germany, and Russia, as well as Indian and Pakistani immigrants living in the United Kingdom and Latinos in the United States. Additionally all authors, whenever possible, addressed international and social status (e.g., class, race, ethnicity, indigenous status, age, gender, religion) variations within their topics.

To further capture a variety of perspectives, recruitment of authors also focused on gaining a variety of academic perspectives. Though a majority (65%) of the authors (including coauthors) are sociologists or psychologists, three have interdisciplinary degrees, two are historians, two political scientists, two legal scholars, two geographers, and one each French literature and Russian studies.

A predominance of scholarship on same-sex involved males, however, was unavoidable. Male sexual expression is typically a defining characteristic in the shape of cultures, thus there is more interest in the challenges brought to cultures by male same-sex sexuality resulting in a literature on same-sex sexuality that is dominated by exploration of male–male sexuality. While this section attempts to address that male dominance by encouraging authors to address issues encountered by women and transsexuals, overall the section reflects the dominance of work on males within the literature.

These articles supply a rich and varied contextualization of sexual minorities and, when considered overall, provide global perspectives on four themes (presented below). Encyclopedia users are encouraged to use these themes, as well as other themes they might identify, for an examination of the international commonalities and crosscurrents that occur in the scholarship on sexual minorities, in the lived experiences of sexual minorities, and in the societal and governmental responses to the needs of sexual minorities.

Social Construction of Sexual Minority Categories

Key to understanding the lives of sexual minorities is a very basic question of whether a culture assumes that human sexual behavior should be considered to fall into distinct categories. It is customary in most contemporary Western cultures, and in many other cultures, to have socially constructed distinctions between sexual behavior that is same-sex (homosexual) or opposite-sex (heterosexual), and to assume that the distinction is based on some sort of natural division. However, the scholarship in this section indicates that such divisions are, by no means, based on some sort of natural division.

A well-accepted explanation for the construction of categories is that the cultural division of sexuality into homosexual and heterosexual, and the stigmatization of homosexuality, coincides with the nineteenth century advent of a stage of economic development (particularly industrialization) that results in changes in the functions of families as work units, and in an increase in geographic separation that results in individuals having greater flexibility for exploring and expressing sexuality.

However, not all cultures are at the same stages of development, not all social groups within a culture are affected similarly by development, and other cultural factors may influence how sexual division are constructed. One noted exception to the assumption that constructs of homosexuality and heterosexuality are related to economic development is the situation for women where their typical lower social status results in the treatment of their sex lives as unimportant except to the extent it complements male sexual needs and social reproductive needs; thus the lack of attention given by many cultures to classifying as distinct the same-sex sexuality of women. In a somewhat opposing direction, scholarship also shows that not all same-sex active men are considered to be distinctly different from opposite-sex active men; in some cultures only men who take on stereotypically feminine passive sexual roles are labeled and stigmatized as sexual minorities, men who assume traditionally masculine assertive roles are treated as being no different from men who are primarily heterosexual. Variation is also seen regarding the application of sexual categories to social minority populations (e.g., racial, ethnic, indigenous minorities) where minority populations are often viewed by the dominant culture as having either a hyper- and unfocused sexuality or as being asexual, both of which results in the dominant culture considering sexual categories to be irrelevant for such social minorities. One final, serious, conundrum to consider when questioning the cultural construction of sexual differentiation is presented by increasing research suggesting that biology may, in fact, play a part in influencing whether sexual desires are same-sex or opposite-sex oriented.

Patterns of Cultural Discrimination

As the articles in the LGBT and sexual minority section indicate, despite increasing acceptance of sexual minorities in many (primarily Western) cultures, hostility to, and discrimination against, sexual minorities remains strong in particular regions or population segments in those Western cultures, and is almost universal in some non-Western cultures. The international perspective is particularly helpful here in indicating the mix of reasons used to justify discrimination.

One relatively common justification for discrimination is the assertion that the open expression of sexual orientation (self-identifying as gay) results in the contamination of a nation's sense of identity. This national-identity threat perspective is evident in the differences between political parties in more accepting Western cultures, though the successes of the gay-identified political movement have diluted such effects; the national-identity threat perspective is much stronger in many economically less-developed areas where gay culture is seen as an undesirable import from Western cultures. Religious beliefs are also very often seen as justification for discrimination; such justifications are essentially inseparable from national-identity threat justification in cultures where a religion is part of the national-identity, though religion appears to play less of a separate role in other cultures. Ethnic minority immigrant groups also often use national-identity threat or religious arguments from their country of origin as justifications for discriminating against members of their own groups' adoption of gay identities.

Closely linked to the national-identity threat paradigm is a concern based on the stereotypes of sexual minorities as being unable to perform the various roles that are typically assigned by gender within a culture. This assumption that sexual minorities will dilute gender standards within a culture is usually based on assumptions that sexual minority males will be insufficiently masculine to perform the roles expected of males, including concerns about military service and concerns about producing offspring that will support future generations. Though gender-performance standards for women are less often cited as standards for sexual minority discrimination, close examination of patriarchy in the articles indicates how deeply ingrained female gender-performance standards are with the cultural definitions of masculinity that are used to justify sexual minority discrimination.

Discrimination: Consequences and Responses

As would be expected, the sexual minority scholarship shows that the long histories of discrimination have had a negative impact on the health and well-being of sexual minorities in general, and specifically on that of more vulnerable populations such as youth, seniors, and women. Sexual minorities have organized politically in response to these specific negative effects, as well as for broader demands of an end to stigmatization and freedom of sexual and emotional expression.

The political activities of sexual minorities have resulted in substantial gains in their social acceptance in Western cultures, as well as in vital gains in recognition of their needs in non-Western cultures. As the scholarship indicates, often such gains are associated with the development of actual physical neighborhoods that include businesses, social and political activities, health service providers, and residential areas where sexual minorities can live in relative comfort and feel that their sexuality is validated by others. Accompanying such development of actual communities has also been an increase in the number and types of employers that have specific policies of

acceptance of sexual minorities, as well as the development and implementation of governmental policies that guarantee the rights of full citizenship (including parenting) for sexual minorities. Clearly scholarship such as that used in this section has also benefited from this organizing.

Future Directions

Even with the very successful organizing for the rights of sexual minorities, the benefits of that organizing are not universally accessible. The sexual minority scholarship suggests that the benefits of this political and social organizing are often most apparent in cosmopolitan cities, but even there the benefits are often not accessible to indigenous, ethnic, racial, or working-class sexual minorities.

What, then, to do? Questions are raised among the scholars regarding whether the existing political activities have actually been too limited by focusing on rights within the context of Western, majority-based assumptions about sexuality, identity, power (particularly patriarchal power), and citizenship, resulting in too much of a focus on the ability to be accepted into the standards of the dominant population and too little on the ability to develop alternative approaches to sexuality and self. Scholarship that covers the history of sexual minority politics indicates that this tension between acceptance by a culture that is predominantly and normatively heterosexual, and the ability to express sexual and emotional needs that do not easily fit within those norms, is historically reoccurring.

It is often now argued that we may be entering a 'postgay' world where politics, actions, and lives based on identification with a differentiated, same-sex, 'gay' sexuality, no longer matter. Considering the historical and continuing limits on same-sex sexual expression encountered by significant social groups in the West and even more so outside the West, the end of sexual politics that is suggested by the term 'postgay' appears to be premature – though the labeling of that sexual politics as 'gay' politics may change.

Lesbian, Gay, Bisexual and Trans-sexual: Commercial Sex

Jason H Prior and Penny Crofts, University of Technology Sydney, Broadway, NSW, Australia

Abstract

Forms of commercial sex extend beyond prostitution to include a broad range of businesses that produce sexual goods and services; many of these cater to a broader range of sexual predilections, and include Lesbian, Gay, Bisexual, Transgender, and Intersex (LGBTI) consumers among their clientele. This article provides an overview of the shifting attitudes toward and culture of LGBTI commercial sex, and how the placement and access to LGBTI commercial sex within Western jurisdictions cannot be considered a simple response to patterns of supply and demand, but rather as the outcome of complex interactions of moral codes, legal structures, and other forms of regulations.

Introduction

Sex has long been a commercial concern. Despite the frequent focus on the 'prostitution' form of commercial sex, commercial sex has long existed in diverse forms, and in recent decades, it has increasingly been described using the rubrics of *sex industry* and *adult entertainment*. Forms of commercial sex extend beyond prostitution to include businesses that produce sexual goods and services for sale through bars, restaurants, cabarets, clubs, brothels, discotheques, saunas, massage parlors, sex shops with private booths, hotels, flats, dungeons for bondage and domination, Internet sites, cinemas, and anywhere else that sex is offered for sale ranging in frequency from occasionally through to commercialized sexual festivals. Commercial sex also includes the production of goods and services including erotic phonelines, escort services, films and videos, souvenirs, toys, clothes, equipment, and live and 'virtual' spectacles via web cameras. Although most commercial sex is for heterosexual consumption, many of these venues cater to a broader range of sexual predilections and tastes, including Lesbian, Gay, Bisexual, Transgender and Intersex (LGBTI) consumers among their clientele.

The social actors involved in LGBTI commercial sex, like in the broader sex industry, are diverse including not only those who sell sex directly and their customers but also business owners and investors, independent contractors and nonsexual employees (waiters, cashiers, guards, drivers, accountants, lawyers, and doctors), and facilitators of business processes travel agents, guides, estate agents, matrimonial agents, newspaper and magazine editors, as well as Internet entrepreneurs. Not all of those involved in LGBTI commercial sex are themselves LGBTI; there is a degree of sexual fluidity between those who take part in LGBTI commercial sex and those who participate in the broader sex industry, with 'gay-for-pay' by pornographic stars or sex workers who self-identify as heterosexual and heterosexual prostitution by self-identified lesbians occurring. Additionally, the regulation of LGBTI commercial sex occurs at the intersection of discourses about homosexuality *and* commercialization of sex; thus policy makers and legal agents are also involved.

The Culture of LGBTI Commercial Sex

In recent decades, parallel processes of economic and social mainstreaming have brought LGBTI forms of sex commerce out of the shadows and into the formal economy, with new technologies (e.g., the Internet and mobile telephony, see Zook, 2003) creating diverse opportunities for direct and indirect sexual commerce for LGBTI consumers. We have seen the rise of LGBTI brands, such as the international newspaper *The Advocate*, and of adult content on the Internet and on pay-to-view television, suggesting a significant shift from the margins to the center as all forms of sexuality become more openly discussed (Attwood, 2006). This increased mainstreaming has a clear spatial relationship to the rising visibility of sex premises, in particular for gay men, men who have sex with men, and bisexual men, within many Western cities. Venues such as exotic dance clubs, sex cinemas, sex clubs, and gay and/or lesbian bathhouses are now visible in many city centers and entertainment districts, widening the range of entertainment choices for LGBTI consumers. Likewise, adult retailers and shops are branding products specifically for LGBTI consumers, while in some jurisdictions, specific escort agencies, brothels, and erotic massage parlors are now regarded as legitimate land uses and cater specifically to LGBTI consumers (Prior and Crofts, 2011).

Although LGBTI commercial sex has never been a solely urban phenomenon, in recent decades it has been most visible in specific areas of urban towns and cities; districts that often center on a cluster of commercial establishments such as gay bars and bookstores, restaurants, cabarets, clubs, brothels, discotheques, saunas, massage parlors, sex shops, hotels, flats, and dungeons for bondage and domination; as well as cinemas that cater specially to the needs of LGBTI consumers (Nash, 2006). Sometimes, art exhibitions and theatrical plays appear to temporarily form part of the industry and many of the sites and forms mentioned also promote and sell nonsexual products and services. Some of these precincts, such as Oxford Street, Sydney, Australia, are often associated with larger scale collective events such as lesbian and gay pride festivals. These LGBTI precincts, festivals, and the LGBTI goods and services that they produce are increasingly being incorporated into western cities' place marketing and business strategies. Research suggests that the underlying political and economic processes that created these commercial areas have been driven by largely urban-based, predominantly white, male-dominated gay social and political movements that have taken their own alternative codings of space 'out of the closet' and into the public sphere, but usually within racist, sexist, and procapitalist discourses

(Knopp, 1992; Brown, 2009). Their most obvious impact has been the proliferation of visible (but disproportionately white, male, and middle-class) gay commercial, residential, and leisure spaces. This has resulted in vibrant gay commercial and entertainment scenes as well as the pink economies of cities such as Amsterdam, London, San Francisco, and Sydney.

Conversely, others have noted how lesbians also asserted their rights to commercial space, although sometimes more quietly than gay men. Researchers have suggested that lower incomes and a higher likelihood of child custody shifts lesbian residential location choice toward less expensive areas with more attractive facilities for children. Lesbian clusters have also existed in places like Erskineville, Sydney, and in smaller cities like Northampton, Massachusetts (Forsyth, 1997). Lesbians appear to be particularly sensitive to the dominance of markers of heterosexuality (e.g., advertisements and public announcements referring to heterosexual couples) in urban space (Valentine, 1993) and, unlike gay-male-dominated areas, often do not create visibly marked commercial territory in the built environment. This subtlety has often meant that lesbian neighborhoods are not as visible as overtly gay (male) areas (Podmore, 2001). For example, Rooke (2007) suggested that many lesbian bars exist not as fixed places, but as temporary (i.e., rotating) women's nights in various locations, allowing communities of like-minded women to blend into the built environment.

These apparent differences in approaches to the development of commercial opportunities for lesbians and gay men can be understood as developing on the complex social totality and fundamental frame of reference for Western culture that emerged in the nineteenth century, characterized by dualistic thinking and cross-cutting as well as mutually constitutive sets of social relations including those of race, class, gender, and sexuality, which saw cities characterized by very traditional gender-based spatial divisions of labor dominantly coded as heterosexual and imaged and experienced in terms of public and private spheres of existence (Sedgwick, 1994).

Increasing research has provided insight not only into the way in which LGBTI sex commerce has evolved but also into the way in which such commercial sex has played a role in the formation of LGBTI identities, practices, and behaviors (Brodsky, 1993). Within this context, LGBTI commercial sex is presented as an evolving culture that adapts to significant shifts in LGBTI sex cultures, such as the arrival of acquired immunodeficiency syndrome. Such adaptations have included the reinvention of sexual goods and environments to support modified sexual behavior, such as the development by the proprietors of commercial sex premises of jack off rooms to replace backrooms as a low-tech yet more embodying response to safe sex. Other adaptations include the development of video and printed pornography, phone sex lines, bars featuring erotic dancers and strippers, and computer-networked bulletin boards. Thus LGBTI sex commerce shifts and evolves over time and place, with some forms becoming unpalatable for gay culture, while others emerge as appropriate. Along these lines, the assimilation of gays has resulted in the demise of LGBTI neighborhoods within many Western cities, with studies revealing how some former LGBTI neighborhoods have become less tolerant of LGBTI people and the commercial sex businesses that anchor these LGBTI communities (Doan and Higgins, 2011). Apparently in response to these changes, we are seeing the rise of new forms of LGBTI commercial sex, part of which involves the Internet and mobile phone.

Attitudes to LGBTI Commercial Sex

Attitudes to commercial LGBTI sex reflect a complex confluence of discourses about commercialization of sex and about LGBTI identities and practices that vary across and within Western jurisdictions. These attitudes depend on a range of complex and often conflicting discourses, including religious, psychiatric/psychological, legal, popular, economic, and political ideas and practices, which guide which sexualities are considered good, moral, healthy, normal, and virtuous and which are not. Emerging research has pointed out that these conflicting discourses are not stable and are contingent. Commercial sex often enjoys only a precarious position within many Western jurisdictions, despite the evident demand and supply of sex for sale in Western cities, past and present. Since the 1970s, social research has argued that these discourses have tended to privilege a certain portion of human sexuality, heterosexual, monogamous relationships focused around 'love' and the family (Rubin, 1993). By reducing sex to a commercial transaction rather then one based on 'love' (although the two are not mutually exclusive), commercial sex has historically been regarded as harboring sexual and moral disorder. Here, the influence of religious groups has often been considerable, with the antipornography movement drawing sustenance from fundamentalist worldviews that emphasize the dangers associated with 'an open marketplace of morals' associated with the reduction of sex to a commodity that can be bought and sold (Hayes et al., 2011). Given that LGBTI identities and practices have also often been viewed as sexual and moral disorder, LGBTI commercial sex becomes regarded as doubly deviant – breaching multiple assumed codes of sexuality and love.

In part due to the double deviance, the operation of LGBTI commercial sex beyond the margins of privileged human sexuality has led to opportunities to operate in ways that are outside the purview of regulation, with resulting venues created for specifically LGBTI audiences. At the same time, increases in discourses of legitimacy and rights have provided rationales for access to and location of commercial sexuality, resulting in freedom of choice in terms of LGBTI consumerism. In recent decades, due to the activities of feminist, gay, lesbian, and other movements arguing for legal change, the strength of sex worker advocacy groups, and a liberal authoritarianism that increasingly regards the sex industry and its clients as able to take some responsibility for self-governance, LGBTI commercial sex has begun to move from spaces of transient ownership (e.g., in public parks and wasteland, pseudoindustrial districts, and areas in transition) to more visible and commercial sites (Prior and Crofts, 2011).

These shifting and competing discourses have meant that in recent decades some sexualities at the borders of acceptability within some Western jurisdictions, such as some forms of commercial sex, sexual practices, and identities such as homosexuality, bisexuality, transgender, and intersex, have edged across the line of acceptability and been rewarded with greater levels of freedom (Rubin, 1993). For example, the

emergence of prominent areas of gay and lesbian commerce within some Western cities has been identified as evidence of this shift (Binnie and Skeggs, 2004). However, with greater visibility, there is also greater regulation.

Even though attitude surveys indicate that the public is becoming generally more liberal in its opinion of commercial sex and toward LGBTI within a range of Western jurisdictions (Tibbetts and Blankenship, 1999), the increased commercialization of LGBTI sexuality within the media, sex premises, and cities has not been universally welcomed. Venues and practices that were previously beyond the margins of the law are now situated within legal frameworks and must satisfy legal duties and responsibilities (Prior and Crofts, 2011). For example, sex premises including gay and/or lesbian bathhouses remain capable of exciting considerable opposition (Prior, 2008). When confronted with commercial sex in their own backyard, many residents and business owners display a strong 'Not in My Back Yard' attitude, with residents and businesses demonstrating over their neighborhoods' contamination by commercial sex. Such campaigns of opposition are particularly pronounced when sex premises are proposed in areas with little prior experience of the sex industries, such as suburban and residential areas (Hubbard, 2009). Often, considerable social conflict is associated with the perception that commercial sex is taking over large areas of Western cities. Within these contexts, concerns are often expressed for the relationship between commercial sex and a broader range of potential criminogenic effects, with customers and workers alike accused of criminality ranging from the mundane (public urination and illegal parking) and opportunist (drug dealing and theft) through to predatory acts of sexual violence (international organized crime, illegal immigration, and sex trafficking) (Edwards, 2011). In many cases of opposition, it appears that these anxieties coalesce with the objections of religious groups and antipornography campaigners who regard LGBTI commercial sex as a form of *moral* pollution (Hanna, 2011).

Furthermore, LGBTI communities often express concern for the way in which their sexual practices and identities are being commercialized. As Binnie and Skeggs (2004) highlight, the increased visibility and marketing of gay consumer precincts in recent decades, such as the Manchester's gay village, results in the use of those precincts by nongays. In particular, the consumption of gay culture by straight-identified women has been contested by some gay men who fear a heterosexual invasion and thus a loss, a reheterosexualization, of 'their' space. Similarly, recent pride festivities in Sydney have come under critical scrutiny for their increasing commercial focus and the apparent replacement of politics with hedonism.

The Regulation of LGBTI Commercial Sex

The regulation of LGBTI commercial sex expresses discursive constructions of homosexuality and the commercialization of sex. The location and access of LGBTI commercial sex within Western jurisdictions cannot be considered a simple response to patterns of supply and demand; rather it is the outcome of complex interactions of moral codes, legal structures, and other forms of regulations. Within an increasing number of Western jurisdictions, the private sexual conduct of consenting LGBTI adults is rarely considered in need of regulation. However, the same cannot be said of businesses that profit through the sale of sexual services, goods, and imagery, including but not limited to LGBTI products. Much, but not all, of the regulation of commercial sex has been developed with a focus on heterosexual commercial sex, with an assumption of the need to protect women from exploitation by men. This regulation seeks to police and monitor these sites, goods, and imagery, at the same time as restricting access for those who might be offended by their sights or sounds or to protect those deemed vulnerable to 'corruption.' In most jurisdictions, there has been a clear anxiety to make such spaces off-limits to minors, as well as distance them from specific cultural and religious groups who object to commercial sex on moral grounds.

Regulating the diverse forms of LGBTI services, goods, and imagery presents a number of legal and logistical challenges to those who wish to regulate them. As a result, many forms slip through the net, subject to no specific forms of regulation. Nonetheless, most Western jurisdictions have adopted laws and policies that aim to confine sexual acts, goods, and nudity to specific spaces, and many forms of sexual display are subject to obscenity acts, which attempt to limit the circulation of materials with sexual content in both public and private spaces. While some have seen the rise of access to LGBTI sex goods, sex services, and pornographic imagery through the Internet as part of the ongoing sexualization of culture (Zook, 2003), it has presented new challenges to those Western jurisdictions who seek to control access to such commerce. Within a range of Western jurisdictions, the desire to protect 'family values' has thus encouraged the introduction of a rich and diverse range of legislation intended to control the content of and access to, for example, pornographic materials, with legislators constantly seeking to refine the boundaries between what is suitable for general consumption, what only (consenting) adults can access, or what is prohibited to all.

The regulation of LGBTI sexual commerce on the Internet is part of a long history of attempts to regulate spaces of LGBTI-related sexual commerce, including sex services, sex shops, adult bookshops, cinemas, gay bathhouses, and other premises where LGBTI sexual content is displayed or exchanged in Western jurisdictions. Such regulation often proceeds from the assumption, as discussed earlier, that commercialization of LGBTI sex promotes crime, nuisance, and disorder (Prior and Crofts, 2011). The extent to which commercial sex should be treated as potentially 'harmful' is hindered by the paucity of evidence about the nature and extent of its impacts. For example, currently, there is a reliance on a small number of US studies on 'secondary effects' that draw markedly different conclusions about the impacts of sex businesses in different cities (e.g., Linz et al., 2004). Regardless of whether decisions regarding harm are based on evidence or perception, the idea that LGBTI sexual commerce is more deviant than heterosexual sexual commerce has meant that LGBTI sex commerce has traditionally been subject to moral campaigns of prohibition, or subject to being socially and spatially marginalized.

Historically, much of the regulation of commercial sex has been driven by a focus on heterosexuality. This has had at times unexpected consequences on LGBTI commercial sex. It has also led to strange bedfellows – with radical feminists concerned about the exploitation of women by men, hooking up with

conservatives concerned about the commercialization of sex and homosexuality (West, 1987). For example, radical feminists Dworkin and MacKinnon (1988) developed an Antipornography Ordinance premised upon the harm of pornography to women by men. The ordinance was overturned as a violation of the First Amendment in the United States, but was influential in Canada. Although the ordinance was aimed at protecting women from men, there is evidence that gay and lesbian images were particularly targeted – displacing the concern about harm to women with a more conservative agenda of concern about LGBTI. Why the extra concern about LGBTI sexual commerce? LGBTI commercial sex for LGBTI audiences challenges dominant constructions of femininity and masculinity by displacing the heterosexual norm (Stychin, 1992), bringing into question the radical feminist analyses of women as 'fuckees' and as victims (Cornell, 1995). An example of such a challenge can be found in the actions at lesbian strip clubs such as *Gurlesque* in Sydney, Australia. *Gurlesque* was formed with the idea of unpacking patriarchal heterosexual preconceptions of the perfect female body, offering opportunities for professional and nonprofessionals alike to construct and express lesbian sexuality.

While criminal law has long been used as a mechanism to regulate LGBTI sexualities and their commercial forms, social research has increasingly highlighted how obscenity, licensing, zoning, planning, and licensing law are becoming more important in controlling the visibility and location of LGBTI commercial sex within a range of Western jurisdictions (Doan and Higgins, 2011). These mechanisms play a significant role in the process of sociospatial ordering within these diverse jurisdictions. Indeed, numerous studies have shown that the interpretation and enactment of these various mechanisms through the work of planners, licensing officers, environmental health officers, and police officers produce a 'patchwork' of local norms, marking conduct as either appropriate or transgressive depending on where it occurs (see Forsyth, 2001; Prior, 2008). The consequences of this for LGBTI businesses can be far reaching, with hotels, clubs, gay and lesbian bathhouses, and shops targeting LGBTI consumers deemed inappropriate in many residential spaces. For example, Doan and Higgins (2011) provide plentiful evidence that planning officers seek to promote neighborhood renewal by displacing LGBTI businesses to make areas more appealing to heterosexual families. Furthermore, irrespective of their function, many LGBTI-focused facilities be they for commercial sex purposes or not, are classified as commercial sex premises, and hence subject to the same types of zoning ordinances, planning instruments, licensing, criminal laws, that seek to locate sexually oriented businesses and sex premises away from 'family' areas, education facilities, and other 'sensitive' populations and land uses (Ryder, 2004). Regulations can also impact on LGBTI practices. For example, the aforementioned lesbian strip club *Gurlesque* had difficulties finding a venue that was licensed for full female nudity due to laws that were constructed to protect women from the male gaze. These rules seemed somewhat farcical when applied to lesbians stripping for lesbians.

The ongoing regulation of LGBTI commercial sex can be understood as sustaining broader economic and social processes that are unrelated to LGBTI culture. For instance, it has been argued that maintaining a separation between 'family-friendly' spaces and spaces of commercial sex (LGBTI oriented or not) helps construct a divide between good and bad femininity. Lasker (1998) argues that zoning protects 'good women with family values' from commercial sex land uses by "zoning such uses as far away from single-family, detached home neighborhoods as possible, and into neighborhoods that lower income women call home." Accordingly, the association of commercial sex with immorality and neighborhood nuisance appears an extremely effective strategy for reasserting the sexual values that lie at the heart of the nation–state and – at the same time – displacing commercial sex from valuable city center sites. On this basis, it is possible to interpret ongoing attempts to regulate commercial sex as simultaneous strategies of *capital accumulation* (i.e., enhancing the value of specific tracts of land or communities) and *social reproduction* (i.e., normalizing assumptions that pornography should not be consumed by minors or visible in the public realm). This is evidenced in recent zero tolerance approaches to commercial sex in potentially lucrative real estate locations, with zoning laws and police powers being used to displace commercial sex, ostensibly to protect local communities but often with the intention of prompting the gentrification of areas blighted by sex businesses (Papayanis, 2000).

This increased regulation of commercial sex, including LGBTI commercial sex premises, has contradictory outcomes. While such regulation reproduces gendered assumptions, the containment and isolation of spaces of adult entertainment conversely enhance the commercial value of erotic goods and services by granting them scarcity. Indeed, history suggests that isolating commercial sexuality within marginal locations does not serve to devalue it. Rather, the opposite is true: with spatial marginalization, LGBTI commercial sex is brought within the ambit of a *restricted economy* that hoards desire to capitalist ends. Thus the segregation of family spaces from commercial spaces serves to valorize both the family (as an idealized sociosexual relation) and certain forms of LGBTI commercial sex (as an illicit but sought-after commodity) (Sanchez, 2004).

Lesbian, Gay, Bisexual, Transgender, Queer: Bear and Leather Subcultures

Francisco I Surace and Heidi M Levitt, The University of Massachusetts Boston, Boston, MA, USA

Abstract

The lesbian, gay, bisexual, transgender, queer (LGBTQ) community often has been reduced to a homogenous group. However, multiple LGBTQ subcultures have developed across time. The leathermen and bears are two subcultures that arose out of a critique of the mainstream gay men's masculinity. The leathermen movement of the 1960s developed an aesthetic based upon the masculinity portrayed in media representations of bikers of that period, with a focus upon leather attire along with dominant and submissive sexual scripts. In contrast, the bears of the 1980s formed a masculinity that idealized naturalism, with a heavy set and hirsute appearance along with nurturing sexual practices. Both groups began by hosting invitation-only parties but became visible parts of the LGBTQ community through grassroots organization and using the community organization techniques of the civil rights movement.

Leathermen and Bears

The gay community, while sometimes seen as a single homogenous group united by a shared same-sex sexual orientation, contains multiple subcultures and identities. Bears and Leathermen are two of these identities that have an intertwined history but have evolved into their own subcultures. These two subcultures are defined by their focus on redefining the enactment of gay masculinity and by the development of large networks of gay men who claim identities based on membership in the subculture. Both subcultures were influenced by the social issues of their time in the United States, borrowing organizational techniques from the civil rights and human potential movement. Both subcultures have produced complex symbolic understandings and constructions of masculinity, highly structured social organizations, and elaborate practices.

Leathermen

History of the Leathermen

The birth of the leathermen movement can be traced back to the mid-1950s in the backdrop of the biker clubs (Rubin, 2004). These clubs held a camaraderie and thrill that drew in some of the gay veterans from World War II whose experiences in the armed forces had instilled them with the values of order and discipline. These values combined with the aesthetics of the bikers soon developed into the social codes and sexual roles of leathermen (Baldwin and Bean, 1993).

Leather bars, which were key locations for participating in the subculture, began opening in major cities like New York, Los Angeles, and Chicago in the early 1950s. Although San Francisco was considered to be late in the leather scene, it became a focal point of this movement – opening its first bar in 1958, which was said to have closed soon thereafter. However, in 1962 San Francisco saw the opening of the Tool Box followed by three other leather bars – forging three blocks of Folsom Street into what was considered 'leather square'. Additionally, leather paraphernalia that was used in the subculture became accessible via mail companies by the end of the 1960s.

The leathermen primarily utilized leather garb to accentuate their masculinity. Their assertion of masculinity was in sharp contrast to the mainstream representation of gay men as effeminate. When gay men's gender was presented as feminine it often was the subject of humor as well as heterosexist hostility. Leathermen defined themselves in contrast to this media image as well as to mainstream gay men, to whom they referred as 'clones'. The radical masculinity that the leathermen claimed could be seen as having a number of meanings (e.g., Mosher et al., 2006). It could be understood as a self-protective reaction in response to their gay identities being socially maligned as feminine within a heterosexist context. Their masculinity could be seen as a source of pride and as a way of outperforming heterosexual masculinity. At the same time, the valuing of masculinity has been associated with an internalization of sexism and a disparaging of the feminine.

The gay leather culture had close links with an increasing sadomasochistic (S/M) culture (described further below) that facilitated their national presence during the 1970s when multiple leather and S/M groups began to form throughout the United States, including the Eulenspiegel Society in 1971 and Society of Janus 1974 (Rubin, 2004). These two organizations were political in nature and were composed primarily of heterosexual men and women, but remained gay friendly, which helped move both the S/M community and leathermen forward. The 1970s were also marked by a growth in S/M events and parties (Rubin, 2004). For instance, in 1975 the Chicago Hellfire Club (CHC) hosted the first of a special invitation-only annual party called the Inferno. Commercial clubs were opened later such as Mineshaft in 1976, an internationally renowned afterhours sex club in New York City. The Catacomb opened that same year in San Francisco, a primarily leather gay male club that was also invitation-only. Later on the Catacombs also held a separate night for women and had mixed sex and mixed sexual orientation parties. By 1978, Samois, the first lesbian S/M organization was created, but was disbanded in 1982 (Rubin, 2004).

In time the leather community gained more attention and integration within the mainstream gay community (Stein, 2004). They became involved in two organizations that

were created in New York City during the 1980s, Gay Male S/M Activists (GMSMA) and the Lesbian Sex Mafia (LSM). Unlike other gay leather and S/M groups of the time across the United States such as the CHC and the 15 Association in San Francisco, GMSMA, and LSM were open groups and their members did not need sponsorship to join, which increased their numbers dramatically. In 1982, the GMSMA also helped further unite the leather community of New York City by creating the Leather Pride Night Committee, a coalition of local leather organizations. It was during this decade, however, that the leather community was hit hard by HIV/AIDS and with that sense of loss and devastation, leathermen became active in efforts to support AIDS victims, including founding the AIDS Emergency Fund (Levine et al., 1997). With their involvement in AIDS, they were increasingly considered to be part of the mainstream gay community. Seats were reserved for men and women representatives of the leather community on the steering committee for the 1987 March on Washington for Gay and Lesbian Rights, and by 1991, leathermen and corresponding leatherwomen had become a major presence in all pride marches around from New York, San Francisco, and Los Angeles.

Current State of the Leathermen Movement

One of the major events for the leather and S/M communities is the Folsom Street Fair, held every year in San Francisco and considered to be the Mecca of both the leather and S/M movement (http://www.folsomstreetevents.org/). The street fair was created in 1984 in response to challenges to the South of Market leather and S/M communities by both AIDS and urban development. Its aim was to create a fund-raising, political activism, and general entertainment for leathermen and for people who practice S/M. It succeeded very well, becoming an annual event that currently brings 400 000 people together from around the nation and world. The fair also has become a space for educating those interested in S/M by providing workshops and demonstrations.

The Folsom Street Fair inspired the creation of Folsom Street East and Folsom Europe. Folsom Street East (not officially affiliated with the Folsom Street Fair organization), started in 1997, has been held in New York, and is considered to be the largest S/M block party of the east coast. Its future, however, is uncertain since construction in the fair area resulted in the cancellation of the 2013 fair (http://www.folsomstreeteast.org/tdance2013). Folsom Europe, organized by the Folsom Street Fair organization, started in 2004 and is held in Berlin, drawing 25 000 to its 2011 event (http://www.folsomeurope.info/). In addition to these events, leathermen continue to have a strong presence in gay pride and gay cultural events.

Leathermen: Gender and Sexuality

Leathermen's sexuality closely overlaps with S/M sexual practices. The practice of S/M has a long history; Richard von Krafft-Ebing (1998) was the first person to introduce the 'sadism' and 'masochism' into medical terminology, which at the time were not related to pleasure or pain but rather were theories of control. In general, sex theoreticians have postulated psychological mechanisms driving its practice (Rubin, 2004). In his 1940 classic study of American sexual behavior, Kinsey recorded the number of individuals who participated in these sexual acts and his research somewhat normalized S/M sexuality, though at the time those who practiced these sex acts were thought to be living out their fantasies in secrecy and shame.

Due to its association with S/M, the leather community has long found itself outside of both the mainstream gay and heterosexual culture, as it became known for its different approach to gender and sexuality. In their interview-based research on leather masculinity, Mosher et al. (2006) found that leathermen saw this marginality as a central to their identity. To these men the leather community provided a sense of connection and camaraderie that resulted in greater self-acceptance and positive self-concept. They reported not fitting into the greater gay community, which they saw as holding superficial and classist values in contrast to the leather community that emphasized loyalty, egalitarianism, nondiscrimination, and acceptance. To offset the leather communities' marginality, multiple webs and networks were formed nationally to create a sense of 'brotherhood' among leathermen that extends beyond local groups.

Two important signifiers of the leathermen identity are their gender expression and sexual practices (Mosher et al., 2006). The overall presentation and appearance of leathermen is one of toughness and severity. Leathermen wear clothes made of leather such as vest, chaps, and cuffs, to accentuate their physiques as well as render them visible as members of this community. In addition, placing handkerchiefs or bandanas in back pockets have been used to signal sexual role and practice preferences where different colors signify desired sexual practices, and where pocket placement signifies top, bottom, or versatile positions. The use of these methods for symbolic communication has been referred to as the handkerchief code or hanky code, and was seen in the United States and abroad most often by leathermen and some casual sex seekers. Their leather garb and equipment is not only used as a form of communication, however, but it can acquire emotional significance through different sexual rites and can mark the process of becoming a leatherman. In addition, special leathermen flags are used to unite the community; these flags are made up of black, blue, and white stripes with a heart at the upper left quadrant.

Leathermen's sexuality is connected with their sense of self and identity, and the ways in which they structure their personal relationships by denoting dominance or submission as well as status within their community. According to interviews with leathermen (Mosher et al., 2006), their sexuality requires trust and transparent communication about sexual desires, decisions, and consensus about participation in S/M. This communication style is thought to result in a deeper attunement to sexual partners. A man in their study conveyed:

> There has to be a lot of trust involved in leather sex…you have to communicate and really know what you are talking about. I guess in a lot of situations I didn't really put that much thought into it – just somebody you meet on the street and you are going to have sex, you can probably walk away knowing that it's not going to be anything you can't handle. But in leather sex you never know. You have to talk about it first…. [Stating] your limits and what you are into and what you are not into…. After a while you learn to ask the right questions.
> (Interviewee 05; Mosher et al., 2006: pp. 112–113)

While leathermen borrow from the S/M community they use different terminology, for example using 'Leather Daddy' and 'Leather Boy' as ways to mark the power differential in the relationship (Mosher et al., 2006). The lines between leather sex and S/M are also blurry with less emphasis in bondage and pain, and more attention to leather symbols of masculinity. As in S/M in general, roles are negotiated and consensually adopted by partners in an exchange of mutual nurturance, communicated by subservience from the submissive and control by the dominant partner.

While submission, vulnerability, and nurturance are not traditional values associated with masculinity, the leathermen community codified these qualities into markers of masculinity through their sexual and social practices. For instance, submission in leather sex is not thought to be weak position, but rather a display of strength and commitment. In the same token, dominance is not seen as a stronger position given its dependence on the willingness of a submissive partner as well its ability to provide nurturance. In both positions strength and vulnerability are commingled (for classic texts on leather culture, etiquettes, and histories, see Townsend (1972), Mains (2002), and Baldwin and Bean (1993)).

Critiques of the Leathermen: Feminism, Culture, and Class

S/M culture, and by association leathermen, has been criticized by radical feminists who see the use of domination as both patriarchal and by extension unethical and nonconsensual (Deckha, 2011). Feminist critiques of S/M often focus on women and highlight the perpetuation of patriarchy in S/M by endorsing S/M's negotiated enactment of economic, psychological, and sexual abuse. The use of this abuse is argued to be evidence of objectification of women that is believed to be internalized by lesbians from a sexist society where pleasure is derived from the pain of women (Hopkins, 1994). However, this critique may be extended to gay men, who are also raised in a patriarchal and heterosexist society, and who are seen as deriving pleasure from inciting pain in submissive men. Moreover, these feminist theorists suggest that it is a naïve belief that individuals can consent in S/M. They raise concerns that S/M may be evidence of an internalized patriarchy that renders the abuse of women as permissible. The extent to which the experiences of leathermen are relevant to these concerns is debatable as their sexuality is enacted within male community and at times with careful attention to ensuring consensual practices (e.g., Henkin and Holiday, 1996).

Another critique comes from within the leathermen community itself. In the past, psychiatry had used the S/M practices of leathermen to further the notion that homosexuality was pathological; in response the community made changes to reduce psychiatric stigma (Harris, 1997). In this process, leathermen sex shifted away from an original power differential based upon the 'old guard' codes, the leather practices of the early 1950s, said to be based on discipline and order used in the military (Baldwin and Bean, 1993). In the old guard codes the slave was expected to provide pleasure to the master, currently these roles are said to have switched where master is responsible for the pleasure of the slave. It is argued that S/M became a practice of self-realization in line with the human potential movement resulting in an emasculation and feminization of S/M (Harris, 1997).

An additional critique from recent research has highlighted heightened risks for HIV within this community. Leathermen have been found to be 61% more likely to be HIV-positive when compared to nonleathermen (e.g., Moskowitz et al., 2011). The decreased condom use in this community was seen as one of the risk factors.

Bears

History of the Bear Movement

The beginnings of the Bear community and identity are hotly debated and are usually placed somewhere between the 1960s and 1980s (Wright, 1997). The bear movement was rooted in two existing cultures of the time, leathermen of the 1960s, and Girth and Mirth of the 1970s, usually sharing their spaces (Hennen, 2005). The term has been traced back to 1966 with Satyr, a Los Angeles biker club, mentioning the beginnings of a new bear club, but self-identification as bear was more common during the 1970s (Wright, 1997). The street usage of the term 'bear' was initially popularized in Dallas, Texas, by a group of men who proclaimed themselves lovers of 'Papa Bear'. Later on the term was used in an article titled 'Who's who in the Zoo: A Glossary of Gay Animals' written by George Mazzei that was published in the *Advocate* on 26 July 1979. By the 1980s the term 'bear' was used in San Francisco, New York, and Toronto to describe sections of the gay community.

The formal organization of the bear movement was set in 1986 in the middle of the AIDS pandemic and at a time when the leather community was becoming more difficult to access. At that point, men who called themselves bears had begun to form underground pockets of community and those communities, along with the appearance of paraphernalia related to bear lifestyles, started gathering greater attention. The bear community provided an alternate image of gay masculinity to the leather community. Like leathermen, this masculinity was in reaction to the stereotypes of gay men as feminine but they also accepted new members without the need for the rituals or training procedures that were common in leather subcultures – making it a more accessible community. At the time, some have viewed the bear body, full-bodied and hairy, as a symbolic defense against the images of thin gay men being shown as AIDs patients experiencing wasting syndrome (Hennen, 2005). Additionally, bears presented themselves in a manner that reflects an idealization of what are believed to be 'natural' aspects of masculinity such as strength, vigor, and virility.

During this time, computer bulletin boards and listservs were created making communication between individuals more accessible. These technological advances allowed bears to communicate about gatherings, locate community, and become involved in community even when living in nonurban settings. Bears adapted the practice of their fellow leathermen who wore handkerchiefs in their back pockets to make visible their sexual preferences, but instead bears wore Teddy Bears, as totemic representation of the natural and aggressive yet warm and nurturing aspects of being bears (Graves, 2007). In addition, the Teddy Bear was a way to not only attain visibility but to protest the reduction of gay identity to sexual acts and

instead emphasize their preference for cuddling and emotional intimacy.

The bear movement was influenced by the civil rights activity of the time, and borrowed from the early gay liberation movement that requested gay men to 'come out' in the name of visibility. The bear community asked for a second coming out of sorts – a proclamation of the bear identity (Wright, 1997). In this process, men engaged in public displays of the bear identity by adopting a bear appearance and joining groups that held similar views about being gay and gay masculinity.

In July 1987, San Francisco saw the first private invitation-only party called 'Bear Hug' created with an intention to promote an atmosphere of socializing, along with erotic and safe sex practices in midst of the AIDS scare (Wright, 1997). The party became popular and helped further unite the community that frequented them. In addition, *BEAR Magazine* began to circulate in San Francisco. In 1989, across the nation other bear communities began forming to such as the 'Bear Paws of Iowa' who created the first bear club. San Francisco also saw the opening of its first official bear bar, the Lone Star Saloon. The bar was revered as the Mecca of Beardom.

Wright (1997) described that in the 1990s the bear community entered what he termed the formalization phase. By 1994, 40 bear clubs had formed throughout the nation that helped generate a national understanding of what it means to be a bear. These clubs brought with them gay pride representation as well as bear contests, often based within bear clubs, and the International Mr Bear Contest. In addition 1994 saw the birth of new competing bear magazines such as *American Bear*. In 1991, *The Bear Cult: Photographs by Chris Nelson* (Nelson and Lucie-Smith, 1992) captured the image of bears as masculine men who sported beards and ranged in social class and physique.

What Is a Bear? Gender and Sexuality

The literature on the bears is still in its nascent stage, and much of the work is owed to Les Wright (1997) who edited two books, *The Bear Book* and *The Bear Book II*, outlining the history and evolution of the group. As he claims in the introductory chapter 'in this book bears speak for themselves' (Wright, 1997) and articulate their lived experience as means to create a working language. Most other research about the bear community that comes from the social sciences is similarly based upon interviews of bears, such as using grounded theory (Manley et al., 2007) and ethnography (Hennen, 2005).

Bear culture challenges both mainstream gay culture assumptions of what it means to be a gay man as well as the heterosexual notions of masculinity (Manley et al., 2007). While there is no one way to be a bear, and debate continues as to what constitutes a bear, different physical, psychological, and social criteria have been postulated throughout bear history. Overall, what seems to be central for bears is the valuing of naturalism and the social construction of an aesthetic that represented this value. The value of the natural man was embodied in a heavier build and being bearded, less maintained appearance in place of youthful clean-faced trim (mainstream gay culture), or masculine muscular exacting (leather culture) aesthetics. Many people who identified as bears praise the image of actor Steve Reeves in his role as a gladiator in 1950s, a look described as a rugged and mature masculinity.

Physically, two major features have been proposed as 'essential' to being a bear: (1) facial hair (beards, mustaches, and goatees) and (2) general hirsuteness. Facial hair is deeply intertwined with the bear self-identification and identity proclamation. A third criterion, a heavy set (burly or stocky) physique, has shifted over time within the bear community, with controversy dating back to the creation of *American Bear* magazine developed in the early 1990s. These magazines have displayed images of the bear ideal, with *American Bear* representing more men that had a stocky and heavy set build, and *BEAR Magazine* displaying an idea that was more in line with either 'muscle bears', and skinnier 'otters', where both maintained the first two criteria of facial and body hair. As part of the naturalism value, body acceptance and physical comfort were eroticized and a blue-collar or working-class attire was common (Hennen, 2005). Bears sporting ripped jeans, baseball caps, T-shirts, and flannel shirts typified this look.

In contrast to the focus on appearance, others within the bear community have emphasized the psychological dimensions and contend that being a bear is about a relaxed masculine attitude (Manley et al., 2007). Bear social networks are characterized by bears as having an easy-going outlook, camaraderie, and inclusivity, and are often contrasted with what is described by bears as the shallowness, pettiness, competition, and exclusivity of mainstream gay culture. In accordance with the emphasis on the natural, bears are considered to be specifically accepting of maturation and aging and include older members as active parts of their communities.

In addition, while the actual bear animal is thought of as dominating, such is not the case with bear masculinity since top (sexual insertive) or bottom (sexual receptive) positions are usually negotiated within a particular relationship (Manley et al., 2007). Sexual roles are sometimes defined in traditional familial terms with a 'daddy role' defined by assertiveness, nurturance, and guidance, with younger or less experienced men sometimes referred to as 'cub'.

Qualities of nurturance, affection, and emotional expression, which have been more commonly associated with femininity in Western cultures, have been redefined as aspects of bear masculinity. Bear social gatherings are marked by greetings with 'Bear hugs', and a sense of camaraderie is demonstrated between all members of the community through body acceptance (Manley et al., 2007; Hennen, 2005). In addition, bears rescript phallic-centric sexuality by masculinizing caressing and cuddling and eroticizing the whole body. This enactment of bear masculinity challenges essentialist notions of gender.

Socially, a bear identity provides men with a different set of values and aesthetics and a different enactment of masculinity. Yet, their masculine presentation also results in a dual invisibility where they may not be recognized or accepted by other gay men and are imperceptible as gay to heterosexuals. While this might provide assimilation and easy movement between mainstream heterosexual culture and bear culture, it also creates conflict for some who wish to be acknowledged as gay across these social spheres.

Many bears participate in local, national, and international events where they are able to meet other bears, have sexual

encounters, and develop relationships. These events not only help solidify bear identity, but include the opportunity for sexual expression, in what they call play parties. Overall, sexuality among bears has a wide and varied range with some opting for a one partner closed relationship and others for open or polyamorous relationships or for casual sex. In research, bears report that bears are both more sexually active and have more enduring relationships than other gay men (Manley et al., 2007). One participant in this study explained:

> I have seen bear couples in open relationships that have stayed together for many years, including my own…I don't see that same sort of relationship longevity in other groups within the gay community … [the longevity] may be due to more honesty in the relationship and the fact that there's no sneaking around…everything is out in the open.
>
> (Participant #2; Manley et al., 2007: p. 102)

The emphasis on intimacy and communication was thought to be characteristic of the bear community. It should be noted, however, that bears have been identified as being more likely to engage in unprotected anal intercourse in comparison to the mainstream gay culture (Willoughby et al., 2008).

Critiques of the Bear Movement: Feminism, Culture, and Class

The relationship of the bear community to the working class is complicated (Rofes, 1997). While bears aesthetics include dressing like working-class men, not all bears actually have blue-collar jobs – a long-standing critique of the movement's tendency to eroticize the bodies of working-class men and use this imagery as a symbolic place holder for masculinity that their everyday vocation does not provide (Hennen, 2005). After analyzing multiple articles from *American Bear* magazine that depicted working-class men while in contact with middle-class men, Rofes (1997) highlighted how working-class men were not only positioned as more masculine, but also viewed with disgust given the type of labor that they were scripted to perform. Therefore, he concluded that there might be an element of reaffirming class privilege present when middle- and upper-class men are drawn to bear spaces.

Race and class intersections are even more complicated in the bear community because the representations by bears after all are dominated by White working-class men. Few bears of color are present in bear media, despite the bear community's interest in diversifying their ranks (Hennen, 2005). In the book *Modern Bear* (Smith and Bale, 2012), a chapter was dedicated to the black bear (i.e., Black men) and another to the panda bear (i.e., Asian/Asian-American men), providing some representation of bears of color. It should be noted, though, that White bears are not associated with a specific bear type (e.g., polar bear), thus identification of bears of color might still remain controversial given the long and dehumanizing history of associating races with specific animals.

Current State of the Bear Movement

The bear community provides a sense of belonging and a place for gathering and connecting with other like men, as well as shelter from the marginalization these men might experience by both heterosexual and mainstream gay culture because of their sexual orientations and gender expressions, respectively (Manley et al., 2007). Currently, the bear community has grown, organized, and expanded to a global scale. In 2013, the Web site *Resources for Bears* (http://www.resourcesforbears.com) listed 60 active clubs in cities across the United States, 6 in Canada, 14 in Europe, 5 in Central America, and 6 in New Zealand/Australia. These bear clubs are open to Bears and 'their admirers' expanding the accessibility and membership base. In addition, bear visibility has expanded through the use of 'Bearphernalia' such as mugs, shirts, and bumper stickers displaying the colors of the bear flag: white and brown striped with a bear paw print. The visibility of the community has increased further via movies such as *Bear City* (Langway, 2010) and *Bear City 2* (Langway, 2012), documentaries *Bear Run* (Hunt, 2009) and *Bear Nation* (Ingram, 2011), and popular books such as *The Bear Book* (Wright, 1997), *The Bear Book II* (Wright, 2001), *Bears on Bears* (Suresha, 2009), and *Guide for the Modern Bear* (Smith and Bale, 2012).

Mr Bear contests and bear events, called 'bear runs' and 'bear weekends', have also become staples of bear culture that maintain the community. Competitors are judged on how much they have a bear 'presence'. In Massachusetts the Massbearz vote for Mr Boston Bear, in Orlando, Florida, for Mr Bear Bash, and in Kentucky men compete to be Mr Kentucky Bourbon Bear. In addition, many associations in the nation throw weekend-long parties once a year such as the Northeast Bear Weekend in Provincetown, MA, the SF Bear weekend in San Francisco, CA, and the Urban Bear Weekend in New York City. The Web site www.Bear411.com has become a major source for information for individuals interested in bear culture as well as those who may be looking for to meet other bears or to becoming involved in bear community. In addition, modern forms of communication have brought new ways for bears to connect such as using applications for smartphones like Growlr and Scruff that use employ GPS location and time-based technologies to identify other the distance of other bears who may be using the same application nearby.

Conclusion

It is evident that while the leather and bear community developed at different points in history, they both share important elements in their definition as a distinct subculture and identity within the gay community. For instance, they both have developed critiques of mainstream gay masculinity and new definitions of what it means to be a gay man via masculine gender expression. Both groups developed special spaces for meetings such as bars and dungeons, unique symbols such as flags, dress, and body types, and community events such as the street fairs and expos to unite their respective communities. The cultures formed by leathermen and bears extend beyond the generation of new gender expressions to redefine and reconstruct sexual practices. Both communities emphasize the role of trust, honesty, and nurturance as well as rethinking notions of monogamy and promiscuity. Yet another similarity between these groups is their marginality from both the heterosexual and gay mainstream resulting in a double exclusion that might

have led to openness toward those who would like to join their community. Both communities also are marked by an atmosphere of close camaraderie with their members. Another unfortunate commonality is that the risk of HIV appears to be elevated in both groups.

At the same time these two groups are marked by differences in gender and sexual expressions. Leathermen construct a masculinity that is an image of strength and power that places itself in sharp contrast to the feminine stereotypes of gay men. While bears' construction of masculinity includes an acceptance of what is thought to be a 'natural' physique and sets itself apart from both feminine images of gay men and muscle-bound leathermen, their rescripting of nurturance as masculine has been shaped in response to their perceptions of the leather culture as focusing on a harsh masculinity and of gay mainstream culture as emphasizing body ideals.

Leathermen and bears not only demonstrate the possibility of creating highly organized groups within an already marginalized culture, but also highlight how gender expression may evolve as reactions to discrepancies between internal experiences of selfhood and assumptions and stereotypes at play within dominant cultures (Levitt, 2006). These discrepancies can lead to sets of values (e.g., nurturance, naturalism) that may become embodied, materialized, and collectively reproduced in signs, symbols, and practices that become intrinsic to each culture. Ultimately, the genders created can have powerful social and personal implications, affecting identity and selfhood, the social and interpersonal spheres, and the erotic and aesthetic cultures within these communities.

Abstract

Lesbians, or women who primarily have sexual and emotional relationships with other women, face a distinctive set of social, legal, and cultural challenges and stigmas worldwide. With new sources of data about sexual orientation, social scientists have identified features of lesbians' social and economic situation. An overview of this body of research reveals that lesbians generally face economic and social disadvantage, both in the workplace and in organizing their family life. However, an international trend toward greater legal recognition of lesbian families and protections against workplace discrimination suggests that the legal and social context for lesbians will improve.

Legal and Normative Challenges

In most countries, lesbians' economic and social conditions are determined within a social, legal, and cultural context ranging from situations of formal legal equality to contexts that are hostile to the existence of lesbians (ILGA, 2014; Rosenbloom, 1996). In some countries, same-sex sexual practices between women are punishable by prison terms or corporal punishment. States also actively oppress lesbians through arrests and police harassment, discrimination in government employment, exclusion from military service, and censorship of lesbian voices and organizations.

In many societies, norms about gender roles and sexuality stigmatize women who form primary and intimate relationships with other women, and lesbians are often denied the protection of law against the social, physical, and economic abuse that accompanies social stigma. Some evidence of the existence of norms against lesbianism (or homosexuality more generally) comes from public opinion surveys from a variety of countries on every continent (see Rosenbloom, 1996; Badgett, 2009). Reports from 30 countries provide examples of physical violence against lesbians, including rape, murder, forced conversion therapies, incarceration, and suicide (Rosenbloom, 1996).

In most countries in the world, lesbians cannot marry their same-sex partners, which is the method by which heterosexual women formalize and gain state and public support of their relationships. In addition, although other types of legal recognition have been extended to same-sex couples, the legal frameworks of these statuses differ across countries and jurisdictions, potentially limiting the ability of lesbians to support their families. Lesbians often lack legal ties to each other that assign inheritance rights, allocate property after a breakup, provide access to income security programs, and make couples eligible for spousal employment benefits, for example. The psychological and social value of marriage in most societies is also, therefore, denied to lesbians and can exacerbate social exclusion.

Social stigma can have wide-ranging consequences beyond legal inequality, such as being cut off from family support, being denied housing or access to important public resources, and facing discrimination in employment. While civil rights laws in most countries ban many forms of sex discrimination and offer recourse when discrimination occurs, civil rights laws rarely protect lesbians from discrimination based on sexual orientation. Firing or refusing to hire a lesbian because of her sexual orientation is legal in most of the world.

However, the legal recognition of same-sex couples has been rapidly changing, and at least one country on every continent but Asia gives substantial legal rights to same-sex couples. As of 2014, lesbians are able to marry in Argentina, Belgium, Brazil, Canada, Denmark, France, Iceland, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, South Africa, Sweden, the United Kingdom, and Uruguay. Other countries have established alternative forms of legal recognition at the federal and/or city level, such as registered partnerships, and some countries grant some legal rights and obligations to cohabiting same-sex couples. In the United States as of mid-2014, nineteen states as well as the District of Columbia offer marriage rights to same-sex couples, two additional states offer civil unions or broad domestic partnerships, and one offers limited partnership recognition.

Protections against employment discrimination have expanded greatly in recent decades. In 2000 the European Commission issued a directive requiring member states to have laws against employment discrimination based on sexual orientation. At the time, only eight member countries had such laws, but the other countries have since added such protections. Most South American countries have protections in at least some areas of the country. In the United States as of 2014, 21 states had laws banning sexual orientation discrimination in employment, but proposed legislation at the federal level has not been enacted. Some research has shown the U.S. laws to be effective in reducing discrimination against gay men, but the research has not shown an effect for lesbians.

Finally, lesbians are subject to the same economic and social challenges as are all women. Research in several countries continues to show that lesbians earn less than gay and heterosexual men, just as heterosexual women do.

Methodological Issues in Studying Lesbians

Since the 1970s, researchers have begun to study the economic and social position of lesbians. Research on lesbians must first

address the tricky issue of defining 'lesbian.' Studies of sexuality in the United States reveal the lack of concordance between several possible definitions (e.g., Laumann et al., 1994). Women who are attracted sexually to other women will not necessarily act on those attractions. Women who have had sex with women may not refer to themselves as 'lesbians.' Researchers have focused generally their attention on women who have sexual relationships with other women or who identify themselves as lesbian, depending on the historical period or on the culturally appropriate and legally relevant definition.

Research on lesbians in surveys is challenging but has been improving. The social stigma attached to being a lesbian leads some lesbians to keep their sexual identities and intimate lives hidden. Researchers have addressed this situation by using 'convenience samples' drawn from bars or organizations frequented by lesbians, or through 'snowball sampling' methods to recruit study participants through personal networks of other lesbians. These nonprobability sampling strategies do not allow researchers to generalize a study's findings to the broader population of lesbians, unfortunately, since respondents might differ in important ways from the typical lesbian.

In the 1990s, some countries started counting unmarried couples in censuses and other population-based data, and some of those surveys also allowed for the identification of same-sex couples, creating opportunities in some countries to study women who lived in domestic relationships with another woman. Also, Canada, the United Kingdom, and the United States began to include sexual orientation questions on government and private surveys. These probability samples generated higher quality samples for studying the social and economic situation of lesbians. However, many samples are relatively small, allowing for little analysis of subpopulations of lesbians by race, ethnicity, or class, for example. Furthermore, samples of lesbian couples might not be representative of all lesbians. Lesbians in couples might have different demographic and psychosocial characteristics than single lesbians. To the extent that a difference between the groups of partnered and unpartnered lesbians exists, studies which rely on a sample of lesbians from just one group would not be able to generalize their results to the entire lesbian population. (For an excellent survey of these methodological issues, see Institute of Medicine (IOM), 2011.)

As a result of these issues, existing research on lesbians' economic and social conditions is not consistently available across countries and must be interpreted carefully. Generalizations about all lesbians based on a nonrandom sample are inappropriate, and even generalizations from probability samples might be inappropriate if disclosure of sexual orientation on a survey is biased in some way.

In addition to the methodological challenges, research on lesbians has been hampered by the stigma associated with such research. Some political scientists and sociologists in the United States and lesbian researchers from 14 countries, for instance, have reported difficulties in doing research on lesbian- and gay-related topics, such as job discrimination, professional isolation, and lack of funding (see Solarz, 1999).

Despite these roadblocks, researchers are making progress in describing and understanding the lives of lesbians. This research has been spurred on by social scientists' recognition that the study of lesbians (and gay men) can shed light on larger social and economic dynamics (e.g., Blumstein and Schwartz, 1983) and by the need for knowledge created by political debates arising from an international movement for gay and lesbian rights. A growing cadre of social scientists in sociology, anthropology, psychology, economics, history, political science, and other fields has analyzed lesbians' situation with respect to employment and other economic issues and to family life.

The Position of Lesbians and Their Families

In the U.S. women comprise more than half of the population of adults identifying as lesbian, gay, bisexual, or transgender (LGBT), with younger women (18–29 years of age) nearly twice as likely as men to identify themselves as a member of this community (Gates and Newport, 2012). These data indicate that women who form primary dyadic relationships with other women make up significant proportions of the LGBT community, including both lesbians and bisexual women. Additional demographic and cross-cultural research has demonstrated the racial and ethnic diversity of the lesbian community.

Lesbians are a part of civic life, just as heterosexual women, although there are some differences between the groups. One study from the United States (Herek et al., 2010) reported on demographics and social characteristics of lesbians, gay men, and bisexual men and women, showing that lesbians (along with gay men and bisexuals) are less politically conservative than the general population. In their sample, two-thirds of lesbians identified themselves as politically liberal, with around 80% identifying as Democrats. Lesbians were also more likely than heterosexual women to have served in the military.

Like their heterosexual counterparts, lesbians seek romantic partners who share their values and interests, and meet their partners through friends, workplace connections, or social events (Peplau and Fingerhut, 2007). However, the boundaries between lesbian friendships and romantic relationships may be less defined, presenting challenges to both initiating and dissolving intimate relationships. Compared to heterosexual women, lesbians are more likely to maintain friendships and engage in more frequent social contacts with former romantic partners (Peplau and Fingerhut, 2007). Lesbians are also more likely to be in an interracial relationship, compared to heterosexual women in different-sex relationships.

In some cases, lesbians chose to formalize their relationships by entering into a legally recognized union, such as a marriage, civil union, or domestic partnership, while others choose to take part in religious or personal ceremonies without seeking state recognition of the partnership. Individuals outside the primary relationship, such as 'families of choice' (Weston, 1991), may be considered part of the woman's familial network based on emotional and sometimes material bonds.

Many lesbian and gay couples have opted for legal recognition when it is available. One study estimated that 47% of American same-sex couples who live in states that offer some form of relationship recognition have legalized their relationship at some point in time, and female couples are more likely

to register or marry in the U.S. than are male couples (Badgett and Herman, 2011). Rates of marriage or registered partnership are lower in European countries, however (Badgett, 2009).

Many lesbian families include children. In Sweden, 34% of lesbian couples entering registered partnerships were raising children, as were 24% of Norwegian lesbian couples entering registered partnerships (Andersson et al., 2006). In the Netherlands, 18% of lesbian couples are raising children (Steenhof and Harmsen, 2003). Data from probability samples of the United States indicate that between 20 and 49% of lesbians have had children or have children in their households, and more than one-third of lesbians without children reported wanting to have them in one survey. Though a significant number of these children are often from past heterosexual relationships, recent data indicate that this phenomenon may be decreasing, in favor of other types of family formation, including adoption and the use of assisted reproductive technologies (Gates, 2011). Research related to the development of children raised by lesbian mothers indicates that these youth are well cared for and demonstrate similar levels of psychological and social adjustment as children raised by different-sex parents (see review by Patterson, 2009).

Studies of the inner workings of lesbian families find some similarities in the types of tasks and pressures faced by those families compared to families led by heterosexual couples. Lesbians in families raise children, divvy up housework, take jobs to support their families, and care for the family's adult members. As with heterosexual families, lesbians appear to arrive at family decisions through bargaining and appeals to norms, individual preferences, individual skills, and efficiency. In addition, lesbian couples are equally as likely as heterosexual and gay male couples to report being satisfied with their relationships and sexual lives, and use similar problem-solving strategies to address concerns within the partnership.

Although the processes within families show some similarities to heterosexual families, other contextual factors are quite different and result in marked differences. Studies of nonrandom samples of lesbian and heterosexual couples in the US and Britain show that lesbian couples have more equal distributions of housework and labor market work than do heterosexuals, and that their power relations are less affected by which person has higher earnings than is true of heterosexual or gay male couples (Blumstein and Schwartz, 1983; Kurdek, 1995; Dunne, 1997; Rothblum, 2009). Additional research using nonprobability samples indicates that same-sex couples show less negative affect toward each other, exhibit less fear or tension, and express greater affection, humor, and joy with their partners, compared to heterosexual married couples (Gottman et al., 2003, as cited in Rothblum, 2009).

However, while lesbians (and gay men) have reported to researchers that they prefer a more equal division of labor and have claimed to uphold these ideals themselves (Blumstein and Schwartz, 1983; Kurdek, 2007), some ethnographic research in California and New York has suggested that some lesbian couples display a more pronounced division of labor in their household work (Carrington, 1999; Moore, 2008). Other empirical research finds that fewer lesbian (and gay) couples divide labor market participation differentially when there are no children present, but the introduction of children into the household makes the patterns of the division of labor in lesbian (and gay male) couples more similar to those found in straight couples (Antecol and Steinberger, 2011; Giddings et al., 2014).

Social scientists have offered varying explanations for these patterns, with the hypotheses rooted in different theories about the division of family labor. Lesbians might have different and more egalitarian norms related to the contributions of partners and the economic role of women. Lesbians' expectations about likely labor market earnings for each partner might be more equal than those for married opposite-sex couples, reducing the advantage of having one partner do all the housework and the other partner earn all the money income. Lesbians do not have equal access to marriage, an institution that encourages stricter specialization of household labor. Or two lesbians' bargaining power might be more equal as a result of more equal earnings potential. All of those hypotheses would predict more egalitarian divisions of labor within the household, and additional research will be necessary to identify explanations that are most appropriate (Blumstein and Schwartz, 1983; Badgett, 2001).

The Economic Situation of Lesbians

The economic situation of lesbians is somewhat paradoxical. Although lesbians face the challenge of workplace discrimination based on sexual orientation (which is legal in most parts of the world and in most states in the United States), evidence suggests that lesbians' earnings are at least comparable to heterosexual women's.

Supporting the argument that the economic situation of lesbians is poorer than that of heterosexual women, many lesbians in the United States and the UK report on surveys that they have either been discriminated against or harassed at work because of their sexual orientation, or that they hide their sexual orientation at work in an effort to avoid discrimination. Social scientists have demonstrated that discrimination against lesbians in hiring is more than a suspicion. Results from so-called 'correspondence studies,' in which researchers send job applications with fictional résumés from potential employers who differ only in their sexual orientation, reveal that employers in Austria (Weichselbaumer, 2003) and in Greece (Drydakis, 2009) prefer heterosexual job applicants to equally qualified lesbians, even when the only thing that differs is the sexual orientation of the two applicants. The Austrian study used job applicants who varied in gender presentation as well as sexual orientation, and found that employers showed little difference in preferences for masculine vs feminine job applicants, but had a strong preference for heterosexual over lesbian applicants.

Beyond hiring discrimination, unequal and unfair treatment in the workplace can make a lesbian's job more difficult and less pleasant to do, and the resulting stress could lower a lesbian's productivity and therefore affect her future earnings. Moreover, the earnings of lesbian couples are lower than the earnings of many straight or gay male couples; since women generally earn less than men, the income of a couple with two women is on average lower than the income of a couple which includes a man. Lesbians therefore do not face economic challenges based only on their sexual orientation, but additionally based on their gender.

Conversely, other research on the earnings of lesbians finds that lesbians' earnings are comparable to or higher than heterosexual women's. Studies using large representative samples from the US, the UK, Canada, Australia, Sweden, and the Netherlands find that there is either no statistically significant difference in the wages of lesbians and straight women with similar education levels and working experience, or that lesbians earn higher wages than straight women (Klawitter, 2011). No study has found a negative relationship between wages and sexual orientation for women, although data to test for wage differences by sexual orientation are available only in a handful of rich countries. These studies rely on a variety of data sources, and the lesbians represented in them differ in important ways. In some surveys used in these studies, the lesbians under investigation are women who live with a same-sex partner. In other studies, lesbians are women who say that they identify as such. In others, lesbians are identified as women who have had any or mainly same-sex sexual partners. The identification of lesbians in these studies is therefore quite variable. Despite that fact, each of the studies finds that lesbians earn at least as much as straight women. Klawitter's (2011) meta-analysis of the lesbian earnings studies shows that the largest 'lesbian wage premium' is found in studies that use sexual behavior as the identifying characteristic of lesbians.

In the US studies which identify lesbians as those women living with a same-sex partner, lesbian wages are shown to be higher than straight women's. However, it is important to note that despite their higher earnings, the probability that a couple in the US will be in poverty is higher for lesbian (and gay) couples than straight couples (Albelda et al., 2008). Lesbian couples in the US are also less likely than heterosexual couples to own a home (Leppel, 2007), although they do hold more money in savings (Negrusa and Orefice, 2010.).

There are several explanations for the paradox that lesbians face discrimination in the labor market but do not have significantly lower earnings, and these have been tested in the US, the only country where large, representative datasets are available for this research. Both partnered and single lesbians have higher educational attainment than straight women (Black et al., 2003, 2007), a fact that contributes not only to higher wages but also to increased economic and social security. Further, lesbians in couples are more likely to work in occupations and industries that are dominated by men and that are higher paying (Antecol et al., 2008). In this sense, lesbians benefit from nonconformity to female gender roles. Lesbians might also benefit from employers' expectations that lesbians would be better workers than straight women; employers might believe, for example, that lesbians would have more aggressive and competitive personalities than straight women (traits that are desirable in a worker), or that lesbians are less likely to leave the labor force because of pregnancy or in order to handle childcare or family responsibilities.

Indeed, partnered lesbians have much higher rates of participation in the labor force than straight women, both in terms of choosing to work outside the home at all and in terms of the number of hours per week and weeks per year spent working (Leppel, 2009; Antecol and Steinberger, 2011). However, there are two important similarities in the labor supplies of straight couples and lesbian couples: in both cases, the person with higher yearly earnings in the couple works more hours per year than her or his partner, and the effect of having children on the labor supply of the higher earner is weaker than the effect on the lower earner (Antecol and Steinberger, 2011). In other words, in both lesbian and straight couples, comparative earnings within a couple play an important role in determining the working patterns of the people in the couple. These similarities between straight and lesbian couples hint toward the possibility of a division of labor in lesbian couples with children that may parallel that in heterosexual couples: one person does more of the household and childcare work, while the other person earns more of the income (Schneebaum, 2013).

Lesbian Health and Life Course Issues

Research indicates that different social issues emerge for lesbians across their life span. Youth who identify as lesbian, or who have romantic relationships with women, may experience family rejection or bullying and victimization among peers, all of which have been associated with poor health outcomes and poor academic achievement among lesbian, gay, and bisexual youth (IOM, 2011). However, many young lesbians are highly resilient and can effectively cope with these challenges (Saewyc, 2011).

Older lesbians face similar challenges as do heterosexual women, such as becoming caregivers for loved ones and discussing end of life care with their partners. However when compared to gay men, lesbians have a greater fear of outliving their income as they age and feel less prepared for retirement (MetLife Mature Market Institute, 2006). Indeed, probability surveys in the United States indicate that lesbians over the age of 65 who are in same-sex relationships are less likely to be eligible for and participate in an employer-sponsored retirement plan, have less income than married different-sex couples, and are more likely to be in poverty (Albelda et al., 2008; Goldberg, 2009). As a result, older lesbian couples are more likely to use public assistance programs (Goldberg, 2009).

Though subject to many of the methodological challenges addressed above, research largely conducted in the U.S. on lesbian health suggests that lesbians are at greater risk for a number of poor health outcomes, including cardiovascular disease, breast cancer, polycystic ovarian syndrome, and mental health concerns compared to heterosexual women (IOM, 2011). These outcomes are likely influenced by health behavior-related differences between lesbians and heterosexual women, including that lesbians are more likely to be overweight, to use tobacco products, and to consume alcohol (IOM, 2011). There is also evidence that lesbians do not seek preventive health care, such as receiving Pap tests or mammograms, as frequently as heterosexual women (IOM, 2011). These outcomes may be due in part to experiencing discrimination in the health care environment and/or fears of disclosing sexual orientation to providers (IOM, 2011). In the United States, lesbians in couples are less likely to have health insurance than are heterosexual married women, which might play a role in health disparities.

Research also suggests that the health of lesbians (and other sexual minorities) is affected by the sociocultural environment in which they live. For example, in the United States, negative

mental health outcomes are more frequently observed among lesbians, gay men, and bisexuals living in states that have constitutionally limited marriage to only different-sex couples, as well as in states that do not have laws protecting sexual minorities from hate crimes and employment discrimination (Hatzenbuehler, 2010). Discrimination in employment, lower wages, and a greater likelihood of being in poverty may all additionally contribute to lesbians not having health insurance coverage or not being able to pay for needed medical care.

Conclusion

While the social and economic position of lesbians around the world has improved in the last several decades, lesbians still face significant challenges to full equality with straight women. In much of the world, lesbian sexual activity is forbidden, if not heavily stigmatized and a cause of severe harassment. Lesbians face poorer health outcomes than straight women, cannot marry their same-sex partners in most countries, and face legally sanctioned discrimination in the workplace. Despite the extensive challenges discussed above, lesbians and their allies have made significant progress in obtaining social and legal equality based on sexual orientation, and lesbians and their allies have made important strides in demanding and obtaining social and economic equality for lesbians.

Levels of Analysis in Social Psychology

Willem Doise, Faculté de Psychologie et des Sciences de l'Éducation, Université de Genève, Genève, Switzerland
Joaquim Pires Valentim, Faculdade de Psicologia e de Ciências da Educação, Universidade de Coimbra, Coimbra, Portugal

Abstract

The article presents a recent extension of the levels of explanation model initially presented by Doise (1982a, 1986). This extension now also includes a neurological level and an intersocietal level. The latter proved to be useful for explaining recent developments in the study of universal rights. The system/metasystem model initially proposed by Moscovici (1961, 2008) is also further extended. Its application to the judicial realm leads to new interpretations of Milgram's obedience experiments and of Zimbardo's Stanford Prison Experiment. Several studies also show the intervention of metasystems in attitudes toward social solidarity. Finally, complete sets of social psychological research articles in Italian and Portuguese journals may be exhaustively coded when using principles derived from the above models.

Levels of Analysis

The Four Levels Model

On different occasions and also in former dictionary contributions, Doise (1997a, 1997b) has already dealt with the diversity of explanations in social psychology. On the basis of previous extensive studies (Doise, 1982a, 1986), four levels of explanation were distinguished in the fields of the social psychological study of intelligence, of social influence, and of intergroup relations. These were the intraindividual, the interindividual/situational, the positional, and the ideological levels.

Intraindividual

This level of analysis refers to research dealing with the way individuals organize their perceptions of the social environment and the way they behave toward this environment. In these models, the interaction between individuals and social environment is not the direct focus of analysis. The object of analysis here is the mechanisms that, at the individual level, allow people to organize their experiences. In social psychology, classical research about perception of complex stimuli are also typical cases of this level of analysis, for example, research using the models of cognitive balance (Heider, 1946; Cartwright and Harary, 1956) or cognitive dissonance (Festinger, 1957). Also, the process of categorization (Tajfel and Wilkes, 1963) is focused on the modalities according to which an individual organizes his/her experience about the social environment.

Paradoxically, the first level's explanations do not seem to imply social explanations as they are focused on the cognitive and motivational processes individuals adopt in organizing their experiences. However, they are social to the extent that they necessarily introduce components of explanations that we locate at the other three levels.

Interindividual

The second level of explanations involves the intervention of interindividual and situational processes. Often at this level individuals are considered as interchangeable and it is their interaction systems that offer the explanations typical of this level of analysis. At this level of explanation, cognitive processes are, for instance, studied as embedded in, or even generated by, different types of interindividual coordinations. The research of communication structures (Bavelas, 1951) and attribution theory (Kelley, 1967) are good examples of studies situated at this level of analysis.

Positional

The third level of analysis concerns the different positions occupied by individuals and social categories in a given societal framework. For instance, concerning explanations of learning and other modes of cognitive functioning at this level, there is an intervention of different conceptions that social groups have in relation to the role of the school system in a given society. The study of the effects of different social positions in interaction was already present in one of the first experiments on social attribution (Thibaut and Riecken, 1955). In this study, an interindividual relation (one's success to persuade another) was articulated with differences in status preexisting to the experimental situation. This level of explanation is also important in the study of relationships concerning intra- and intergroup differentiation. Actually the articulation of intraindividual level (more or less intracategorial variability in the individual cognitive apprehension) and the positional level (group status or prestige) allows researchers to integrate contradictory results about the out-group homogeneity effect and to go a step further in their conceptualizations of this domain (Devos et al., 1996; Lorenzi-Cioldi and Doise, 1990; Valentim, 2008).

Ideological

The fourth level of analysis concerns ideologies, belief systems, social representations and norms, characteristics of a given society. Their role is to maintain the functioning of a given society notwithstanding its many social differentiations, oppositions, and divisions. The studies of Lerner (1980) on the belief in a just world, and the role of the prestige of science in the interpretation of Milgram (1974) results on the obedience to authority studies are examples of this level of analysis.

Assessing Explanations with the Four Levels of Analysis (1980)

An extensive study (Doise, 1980) of the first seven volumes of the *European Journal of Social Psychology* (EJSP) led to the conclusion that the four different levels of analysis were useful for assessing

explanations by an important sample of authors. The inspection of this corpus of published texts confirmed that indeed most explanations used in the EJSP could be situated at four levels. Notwithstanding the fact that levels 1 and 2 – respectively situated at the individual and interindividual level – accounted together for more than 70% of all explanations offered, other explanations in terms of societal characteristics were also used. Furthermore, when combinations of explanations of different levels occurred, and when level 3 – status and group differences – and level 4 – general beliefs and values – were used, they were often aimed at explaining variations of processes described at level 1 or 2, whereas the inverse pattern rarely occurred. Reductionism, i.e., recurring to individual or interindividual processes for explaining more collective phenomena, was rarely found. Concerning the differences between so-called American and European social psychology, it should be admitted that the four levels were used on both sides of the Atlantic, although the individual and interindividual levels may have been more favored by leading American social psychologists than they were by their European peers.

Contemporary Enrichments and Extensions of the Model

Research developments in social psychology since 1982 led Doise (2011) to revisit the four levels of analysis and to add two more levels, one on each 'side' of the spectrum: an intersocietal level and a neurological level.

Intersocietal Level

Doise (2002) tried to extend the levels of analysis model at an intersocietal level. In this epoch of globalization, humans of different origins and societies become aware of their interdependence and in these relationships, they initiate symbolic representations, social norms, and contractual principles, which often remain implicit. When they enter into a relationship with other persons, they know that the fate of participants in such a relation will be affected by their interaction, in some measure, within certain limits, and at a certain cost. Normative representations exist on what these effects and costs should be. Multiple forms of interdependence exist, characterized by all sorts of differences in status, purpose, interdependency, and formality. Various models of acceptable relationships, prototypes of fair and just relationships, principles of contracts that govern relationships exist. Such models of relationships intervene in multiple interactions; they are culturally but also cross-culturally defined and their application is sometimes guaranteed by institutions. In this context, Doise et al. (1999) developed an international research program on the social representations of principles of universal rights. More recently, colleagues in Lausanne, Spini et al. (2008) extended this research to the study of attitudes and beliefs in war-torn societies concerning basic principles of humanitarian law. This research is not just about societal values and beliefs, it implies the existence of a kind of supraordinate realm of relationships that tie together societies in a common normative framework.

Neurological Level

Since the original publication of the *Levels of analysis* book, other research groups have extended the spectrum of analyses at the opposite end (Doise, 2011). Many researchers now assess variations in neurological cerebral functions while social relations evolve, and some of them do not hesitate to recur to the terms of *social brain* or *social neuroscience*. For example, Amodio (2008) did this in the field of intergroup relations and Harris and Fiske (2009) in the important societal issue of dehumanization. Studies like these are important in furthering the construction of more precise distinctions between characteristics of sociopsychological functioning that seem to involve different neurological networks in the brain. However, the first integrative reports on studies using neural imagery do not redefine preexisting models of sociopsychological processes; on the contrary, they use these models to derive their working hypotheses on the intervention of specific neurological functions, for instance, when more affective or more cognitive aspects of a social experience are involved.

Intersocietal studies and studies of brain functioning do not make obsolete conclusions about variables and phenomena studied at the four levels described by Doise (1982a, 1986). They draw our attention to the important fact that societal values and beliefs are also shaped in an intersocietal context and that in order to be actualized at an individual level, specific neurological structures of the brain have to function. These new studies may enrich our comprehension of preexisting models; they do not invalidate them.

Articulation of Different Levels

The Concept of Articulation

While different kinds of explanation are to be distinguished in social psychology, this does not mean that in the reality of social psychological studies they are actualized separately. Actually, from the beginning of the studies of these levels, it was shown that different levels of explanation often intervened in the study of the same phenomenon. This finding gave raise to the notion of articulation of analyses and to the idea that the articulation of different levels of analysis provides a specific object of study for social psychology. The nature of each articulation is defined by the explanations that it puts in correspondence. Since they are of a great variety, so also are their articulations. "Articulating levels of explanation by hypothesizing the intervention of factors at other levels prompts the researchers to better describe a process conceptualized at one of the levels, while making explicit that this functioning presupposes conditions involving other levels of analysis as well" (Doise, 2011: p. 12).

Other Illustrations of the Articulation: The System and Metasystem Model

Already in 1982, Doise (1982b) pointed out another way of evidencing articulations of explanations based on the concepts of system and metasystem introduced by Serge Moscovici in his *princeps* study on social representations (1961, 2008; *see* Social Representations). Using interview studies, analyzing newspaper articles and survey results, he researched opinions, attitudes, stereotypes, and other kinds of beliefs that French people held about psychoanalysis more than 50 years ago. This led him (Moscovici, 2008: p. 167) to draw "major implications at the level of the working of the intellect. We can see that two cognitive systems are at work in the reflexive effort characteristic of science, philosophy or any form of thought whose goal is the 'apprehension' of categories. The first is an operational

system that works with associations, inclusions, discriminations and deductions; the second is a sort of metasystem that reworks the material produced by the first. The same is true of natural thought, but there is one difference. The metasystem or the relations that constitute it are usually and primordially normative relations. We have, in other words, ordinary operational relations on the one hand, and normative relations that check, test and direct them on the other. Normative values and principles are, by definition, organized."

The metasystem functions in social regulations; in different domains of adult thinking, the organizing principles of the metasystem may also explain intraindividual variations. When, for instance, the same individual acts as a scientist, or on another occasion as a politician, he/she may change his/her way of arguing about the same topic while adopting in one situation reasoning principles that would not be acceptable in another. On different occasions, individuals are part of different metasystems. It is of interest to note that a contemporary French sociologist, Alexis Ferrand (2011) independently came to a similar conclusion.

The development of an individual's cognitive skills or cognitive competences does "not oblige us to believe that these operations will be applied to any and every content. Once they have mastered their physical and ideological universe the child and adolescents are far from arriving at a general use of their intellectual tools. Society does not demand it from them" (Moscovici, 2008: p. 189).

Hence an important task for social psychologists is to study the links between cognitive functioning and social context, between cognitive operations and social regulations, in order to answer the question: "Which social regulations activate which systems of cognitive functioning in which specific context?" (Doise, 1990: p. 115). This means that we are necessarily dealing with the articulation between the level of cognitive functioning and a metasystem (the social regulations) that can be considered at different levels (interindividual, positional, ideological, and intersocietal).

Metasystems can reinvade the experimental setting in a way not anticipated by the experimenter. This was, for instance, the case in Zimbardo's Stanford Prison Experiment (Zimbardo, 1989). However, for our present concern it is more important to comment on the links that Zimbardo (2007: chapter 15) draws between the Stanford Prison Experiment and the Abu Ghraib scandal in Iraq. For explaining the Abu Ghraib incidents as a social psychologist, and also as a citizen, he had to take into account the larger societal context and this was highly important. It showed the limits of Zimbardo's own Prison Experiment, where an intervention of social representations about the prison system in the USA was not even envisaged: it was as if prisons had their social functioning independently of the larger social context.

Zimbardo does not use in his book the terms of system and metasystem but these concepts could be used for explaining what happened in situations such as the Abu Ghraib prison, where competent authorities had created an unlawful situation in which a relevant judicial metasystem ought not to be activated at the right time. Zimbardo's effort to situate the Abu Ghraib scandal in its larger context is fully supported by more extended documentation on the situation by Gourevitch and Morris (2008) based on interviews with the prison guards.

National and international social systems create judicial systems at their own level. Once they are functioning, they may also become kinds of metasystems intervening in different social settings. Such an intervention of a judicial metasystem was illustrated in experiences carried out in the Netherlands by Meeus and Raaijmakers (1995), who very carefully constructed an experimental paradigm for replicating essential aspects of the famous experimental paradigm that Stanley Milgram (1974) created in order to study obedience to authority. Like Milgram, the Dutch colleagues verified that the large majority of participants in their experiments did not hesitate to violate fundamental rights of another person in order to comply with orders given by an academic authority. In their case, the basic right that was violated was the right for an unemployed person to be hired for a job.

These authors introduced new experimental conditions in their studies in which the rate of obedient behavior was drastically lowered in comparison with the standard conditions of their research and of Milgram's research. In these new conditions, subjects were required to sign a statement in which they accepted full judicial responsibility for what could happen when the unemployed person involved might want to sue the academic authorities for what had happened to him/her in the experiment. The well-known obedience to authority collapsed when the possible intervention of a judicial metasystem was evoked. Often fatalistic views on the readiness of people to engage themselves in all kind of reprehensible acts refer to the Milgram experiments. Meeus and Raaijmakers' new experimental conditions about judicial responsibility showed that the independent functioning of judicial institutions may also be part of a social environment and that its mere evocation can lead persons to disobey authorities who want them to victimize others. Maybe autonomy to function at an individual level in some conditions requires institutions to function at a more societal level.

In a book chapter on normative social psychology, Valentim and Doise (2008) insist on the importance of distinguishing a description of an actual observed reality and a description of the normative ideas people have about what, according to them, this reality should be or could have been. In our opinion, social psychology research, and maybe especially experimental social psychological research, is often guided by a kind of fatalistic worldview, a belief that social reality as it is, is necessarily as it is. In other realms of thinking about social reality, distinctions such as the one bearing on a matter of fact and a matter of law often suggest that a given situation should have been, or could have been, different from the actual situation. It is in the light of such distinctions that we try to counter the harsh criticism that Zimbardo (2006, 2007: chapter 11) addresses to the so-called BBC Prison Experiment by Haslam and Reicher (Haslam and Reicher, 2012; Reicher and Haslam, 2006). Basically, he argues that it did not reproduce a real life situation.

Indeed, the BBC prison differed in important aspects from the Stanford Prison Experiment. One of these differences concerned the guard/prisoner relationship; participants were, for instance, informed that the prisoners who behaved well could become guards. These changes apparently blurred role differences and went against current social representations of the prison system. In the BBC experiment, a kind of virtual world was presented that differed from the actual world, a metasystem

was activated, different from the one that regulated the behavior in the Stanford Prison Experiment.

We can broaden perspectives on the articulation between systems and metasystems with further illustrations namely in the domain of studies in attitudes toward social solidarity. The research by Clémence et al. (1994) on *Solidarités sociales en Suisse* was presented by Emiliani and Palmonari (2009) in the first volume of *Paradigmi delle rappresentazioni sociali* (pp. 197–198). Let us remember here that according to our colleagues, basically two metasystems orient people's conceptions on solidarity in Switzerland: one considering society as a more or less harmonious set of social relations based on individual qualities as attitudes of altruism, and the other of a more conflicting nature, characterized by a vision of society opposing individual and collective interests that have to be coordinated.

Are these not two basically different ways of defining one's identity as a Swiss citizen? The first vision furthers a more homogenous vision of society with less danger and insecurity, and which does not involve an important investment of society in a redistribution of resources. The opposite is true for the other conception. The harmonious vision also leads to a more meritocratic view: everyone according to his/her merits, with some possible temporarily limited intervention of public funds in case of hardship, accidents, and so on. Quite different is a vision based on the assumption that inequalities exist between groups and categories of society, implying that public authorities should intervene in order to redress situations of social injustice related to their group memberships.

Hence for Swiss people at least two basic ways of defining one's own national identity and the identity individuals adhere to explain to some extent the readiness of their holders to allow public funding in favor of members of such categories as asylum-seekers, young and old people, handicapped people, drug addicts, and other marginalized people.

The existence of these links was investigated by Clémence et al. and assessed for younger and older respondents, and also by using experimental methods for enhancing the saliency of either basic conception.

Actually, none of the studies that we have presented mentioned the notions of levels of analysis and of their articulation. However, we think that the authors of these studies evoked successively explanatory principles from different levels and it is precisely the articulation of these principles that allows for a better comprehension of the phenomena studied.

Assessing the System and Metasystem Model

As mentioned before, the complete set of the first seven volumes of the EJSP was used to test the levels of analysis model. In order to test the system and metasystem model, the complete set of the five volumes 2006–10 of *Psicologia Sociale* was also analyzed. Let us briefly summarize the main conclusions of the study reported by Doise (2012). A total of 40 systems having their origin *outside* the individual were invoked as explanatory variables. These systems were related to social category memberships ($n = 16$); to family relationships, other proximity relations, or educational institutions ($n = 12$); to structures of relationships and interactions between individuals ($n = 7$); and to political issues ($n = 5$). Only 19 systems were considered as more *internal* to the individual: individual organizations of cognitions or emotions ($n = 11$), individual cognitive or emotional organization directly related to the perpetration or avoidance of some actions ($n = 8$).

Valentim et al. (2013) have done the same kind of analysis in three Portuguese journals covering the period between 2006 and 2012. They used the social psychology articles published in *Análise Psicológica*, *Psicologia*, and *Psychologica*. In the 74 articles analyzed, there is also a clear predominance (73.8%) of the 'systems having their origin *outside* the individual,' and the great majority of these systems are related to social categorizations and/or social identity systems. Systems considered more internal to the individual (cognitions and motivations associated with actions) are only a small part of the total of explanatory systems (26.2%).

Hence the conclusion of these studies is as follows. At the first glance, the omnipresence of systems of variables, under different forms, in the articles analyzed, seems to become a sort of 'lapalissade.' In fact, the evidence gathered could be considered trivial if we did not look in more depth. Of course, we do not advocate such a suspension of interpretative effort.

Certainly, much of the research published in the journals analyzed, using experimental, quasi-experimental, questionnaire-based, or other empirical methods and even theoretical articles, involves analyses that also appeal to other systems while recurring to analyses of social positions and of differentiation among social entities.

If the analyses that surpass the individual or the interindividual level abound in Italian and Portuguese social psychology studies, it is because the only metasystem that guides and regulates the research endeavors of social psychologists is not the one of a scientificity that would be blind to the dynamics of societal and intergroup relations. In fact, we consider that several metasystems are functioning within the general system of social sciences. They result from multiple modalities of overlapping motivations of research in individuals and teams, and in the nature of societal and intersocietal problems. It is clear that scientificity is a general rule but the application of such a standard of scientificity to more specific issues may also result from other social dynamics that are part of a scientist's motivation. The definition of an object of study is not only dependent on, and does not just translate a state of established knowledge. It may also arise from a basic desire to better comprehend the social dynamics in which we participate. Within these dynamics, the general conceptions about the relative importance of social units like families, educational systems, regions, political ideologies, nations, and cultures, have been for a long time already the subject of various discussions that now can be reformulated in terms of scientific debate heuristics.

Conclusion

Results of 30 or more years of enormous developments in social psychology research invited us to revisit the levels of analysis grid proposed in 1982 by the first author of this article. The four levels of analysis in social psychology (intraindividual, interindividual, positional, and ideological) proposed at that time could be expanded nowadays with two more levels for a more accurate articulation of explanations: the social brain and the intersocietal studies.

Furthermore, our investigations about explanations in social psychology were initiated without explicit references to

Moscovici's system and metasystem theory in the princeps study on social representations. Here we extend that aspect of social representations theory beyond its initial framework. The model proved its heuristic value for one of the main tasks of social psychological research: the articulation of explanations from different levels of analysis.

Abstract

Before Lévi-Strauss, anthropology was merely empirical and mostly interested in identifying different cultures' contextual framework. Lévi-Strauss is not just interested in understanding and explaining different cultures from within. He wants to figure out how humans think fundamentally and from there to understand cultural diversity. Lévi-Strauss is the first anthropologist to connect cultural diversity with the unity of humans, that is to say, with human nature. All humans do not think the same, neither do they unite in the same way, but they compose in the same way. They have the same propensity to create representations and institutions, the same desire to bring things into order. The human mind universally processes fundamental intellectual operations upon the perceived world. Those operations build on what the human senses and mind make possible.

Introduction

Claude Lévi-Strauss is one of the very few thinkers who shed new light on humankind and the human's ways to relate to the world. Today, it is almost impossible to reflect upon humankind, society, culture, nature, and the global world without referring to what Lévi-Strauss taught us. He achieved this contribution just after the very darkest moments in humanity's history; that of Nazism and the Second World War. He introduced a complete break with an anthropological tradition that had gone astray and contributed to find a new humanism instead of one that had been soiled by racism. The democratic world had to recover after Nazism. Anthropology had a responsibility in what had occurred. Thus, the French Anthropological Society (*La Société d'Anthropologie de Paris*), which had been established in 1859, had drifted toward a biological and racial discourse. This discourse had already been ousted by the Durkheimian sociological school, which claimed the necessity of studying man as a social being rather than as a biological being. Lévi-Strauss took over the project and illustrated how the symbolic opens a gap never to be closed again between the biological and the social. Based on an understanding of the specificity of the symbolic, he promoted respect for the diversity of cultures and called for the reconciliation of humankind and nature.

Lévi-Strauss, who had Jewish origins fled from France in 1941, like so many other French intellectuals, to take refuge in New York where the *École Libre des Hautes Études* was soon to be founded. There, he taught until 1994 and met Roman Jakobson who introduced him to the principles of modern linguistics, which inspired him to look anew into the way humans originally began to make sense of their world.

Exoticism in Brazil and Revelation in New York

Lévi-Strauss was born in 1908 in an open-minded but not very well-off French family that included several painters and musicians who often took him to the theater, the Louvre, and the Opera. After a secular education and the reading of many novels, he studied law and philosophy. Beginning in 1932, he briefly taught philosophy in two French high schools and soon realized that it was too repetitive a task for him. In 1933, he had just discovered ethnology. He was fascinated by Robert Lowie's book *Primitive Society* published in 1919. In the fall of 1934, he was advised to apply for a newly created sociology professorship at the University of São Paulo. This Brazilian sojourn, which would last until 1939, allowed him to lead two ethnographic expeditions. During the first one in 1936, in one of the very few Bororo villages that had not been influenced by Christian missionaries, he observed a population that had kept its customs and almost entirely dedicated daily life to an incredibly complex religious system that impacted all domains of social life. Marriages, clans, games, dances, costumes, weapons, all clearly related to the religious system. At this point, Lévi-Strauss wrote his first ethnological paper and gained recognition from Marcel Mauss and Paul Rivet who were then the French masters of the field. It is as an ethnologist that in 1938 he set out on an expedition through the Mato Grosso plateau up to the Amazon basin to meet the Nambikwara and Tupi. He was looking for societies, he only found human beings in despair. All the groups he met were in decay. As a result of repeated persecutions, they lived in utter destitution. They had to renounce their ways and lived along the routes where telegraph lines were being installed to beg in order to survive. Lévi-Strauss realized that the civilization developed in Europe was not good for poor countries. Later, in 1955, in his seminal so beautifully written *Tristes Tropiques*, he wrote: "The first thing we see as we travel around the world is our own filth slung onto the face of mankind" (Lévi-Strauss, 2011(1955): 38). Lévi-Strauss never went back to ethnographic work. He had come to the conclusion that social reality now best could be grasped by theoretical work based on already existing observations made before the state of decomposition was reached.

Soon after coming back to France in 1939, he was assigned as liaison officer in a war soon to be momentarily lost. It is thanks to his reputation as an ethnographer that he was invited by the ethnologists, Robert Lowie and Alfred Métraux, to the *New School for Social Research* in New York, thus being able to

escape persecution himself. His flat in Paris had already been looted and all the notes from his first fieldwork stolen.

In New York, he will meet with many a French intellectual, and many prominent American anthropologists: Franz Boas, Alfred Kroeber, Ralph Linton, Ruth Benedict, Margaret Mead, etc. The field is much older in America than in France. It is well established. Also, there is a long tradition and experience in field research. For a whole century a tremendous amount of information has been gathered about all the details of the Indian everyday life. Lévi-Strauss spends many hours in the New York Public Library perusing the vast literature gathered about the systems of kinship. Before leaving France he had just read in the *Annales Sociologiques*, Marcel Granet's 'Matrimonial Categories and Relations of Proximity in Ancient China.' In it, Granet was shedding light on seemingly very diverse rules of kinship by pointing out a limited number of principles integrated in those rules.

At the *New School for Social Research* he met Alexandre Koyré, the Russian born professor of religion history from the Parisian *École Pratique des Hautes Études*, who introduced him to the Russian linguist Roman Jakobson. Thanks to Jakobson, he discovered the principles of modern linguistics and phonology that were to play a very decisive role in his conception and definition of structure. With Jakobson and Troubetzkoy, phonology had moved from the study of conscious linguistic phenomena to their unconscious infrastructure. The smallest units of speech (the phonemes) do not carry an intrinsic meaning. Still, they contribute to communication. They are combined unconsciously by those who speak in a systematic way that can be studied. The important thing is not so much the sound units as such, but the relations between them. What matters is how they make a difference. The system is made of distinctions and oppositions.

A Fundamentally Symbolic Taboo

It is this very idea that will inspire Lévi-Strauss to study the different traditions of kinship as systems, the principles of which remain unconscious to those who enact them year after year. For humans to be able to communicate through language, ways of making distinctions have to be present in the human mind. They are present in all languages over the world. For kinship relations to exist and be maintained, there need be mental operations bringing into play some fundamental structures of the human mind present in all human beings of all times and of any society. As phonemes, kinship relations/terms are signification elements to be combined in a system.

Back in Paris, Lévi-Strauss was to submit his doctoral thesis *The Elementary Structures of Kinship* in 1948, which gave completely new insights into issues that were puzzling the field since the beginning (Lévi-Strauss, 1977(1949)). Rules of kinship stipulating who to marry or not was one of anthropology's major headaches. Most anthropologists, confronted with the contradictory nature of the diverse explanations of the prohibition of incest had left it aside, in much the same way that linguistics had renounced trying to account for the origin of language. Lévi-Strauss explained that the incest taboo could not be grasped as a psychological or biological phenomenon but had to be thought of, not as a negative prohibition, but as a positive rule of exchange instituting the social: The initiative of making unions is no longer at the sole initiative of natural relations. It is removed from the realm of nature and entrusted to the social group and ensures the group's existence as a group. It is such an imposition of rules that brings about culture as it replaces chance by organization. The prohibition of incest prevents the social group from spilling into "a multitude of families, which forming so many closed systems or sealed monads which no pre-established harmony could prevent from proliferating or from coming into conflict" (Lévi-Strauss, 1977(1949): 479). "The first logical end of the incest prohibition is 'to freeze' women within the family, so that their distribution, or the competition for them, is within the group, and under group and not private control" (Lévi-Strauss, 1977(1949): 45). Not only does the prohibition of incest institute society as the order of culture, but also as the realm of alliance. According to Lévi-Strauss, a culture is a system of differences, that is to say a set of terms and relations governed by rules. (But, as we will see, it is not *a Ding an sich*: The reality of each cultural group is always relational.)

What matters is not so much the highly varied forms of matrimonial but the universal character of incest prohibition. Under these varied forms, this founding norm of culture is to be found in all societies presented as a natural fact. For Lévi-Strauss, this indicates that something fundamental happened when the human species began to think and communicate in such a *symbolic* way. Lévi-Strauss argues that it is the advent of the *symbolic order* that constituted the advent of a truly human society. He speaks of a *symbolic origin of society* whereas Émile Durkheim wanted to explain the symbolic by the social. He also goes against Marcel Mauss whom he considers to be his master: "Mauss still thinks it possible to develop a sociological theory of symbolism, whereas it is obvious that what is needed is a symbolic origin of society" (Lévi-Strauss, 1987(1950): 21). Therefore, sociology cannot explain the genesis of symbolic thought, but has to take it for granted in man. He stresses that all social activity and production are indeed symbolic. However, symbolism is the very condition of the formation of any human society. It is coextensive to the very idea of institution. It is what makes possible all the different systems of differences – that can be called cultures – we experience in the various societies we now know of. They could not exist, if it was not for the symbolic system made possible by the human brain when language emerged. For Lévi-Strauss, "No social phenomenon may be explained, and the existence of culture itself is unintelligible, if symbolism is not set up as an *a priori* requirement of sociological thought" (Lévi-Strauss, 1945: 517–518). According to Lévi-Strauss, symbolism is a constructed order governed by a rule. Its arrangement of terms makes up a system. The specificity of a symbolic system is not to signify or illustrate; it is to operate. In other words, it is not just an arrangement; it makes it possible to perform something and to relate to many things. The symbolic function cannot be separated from a social system of reciprocal recognition and accepted conventions. A symbolic operation consists in grasping anything endowed with meaning within a system of relations to make sense of it in an operational way. "Any culture can be considered as combinations of symbolic systems" (Lévi-Strauss, 1987(1950): 16). The symbolic systems in which cultures originate are unconscious, and that there is

something to be combined in a symbolic system is due to the fact that the human brain ended up being able to organize its specific perception and interpretations in specific ways.

According to Lévi-Strauss, societies are rooted in a foundational belief. Cultures and societies are creations brought into being by the thought of their existence; they are not something that has an independent intrinsic existence independent of what mankind may think. Money is an institution; a river is not. In order for money to exist, people have to agree that it can exist and be used by them. All institutions are like that. They are artifacts, not things. For a society to exist, people have to agree that it does and to make it alive.

The relation between the evolution of the brain and the emergence of the symbolic would later be confirmed by studies of human evolution that showed the relation between the evolution of the brain and that of techniques. At the time of Durkheim the social was often conceived in relation to techniques. A few decades earlier, it was still common to assume that technical intelligence preceded and helped develop language. Today after so many scientists – aided with new technologies and new collective ideas – studied the evolution of tools, skull sepultures, and parietal art, the most convincing explanation is that both developed simultaneously and that art, spirituality, and rituals, such as funerals, could not have existed if it were not for the human language (Gibson and Ingold, 1995; Gibson, 1996; Langaney, 2000(1998): 26). The twofold structured symbolic language that humans use to transmit, address, and discuss meanings and significations is much more complex than animal languages that cannot be used to assign and combine significations as is permitted by human language.

Myths and Structures

In 1950, Claude Lévi-Strauss becomes professor of religious science at the *École Pratique des Hautes Études* where he is to study and teach comparative religious systems of peoples without inscribing whose way of life has remained the closest to what it was in the most distant past. This leads Lévi-Strauss to the study of myths to which he will apply the same principles he used in the study of kinship with the same ambition: To figure out the common logic at stake behind the seemingly very different cultural creations. He will continue applying the basic principle from linguistics that no symbol exists in isolation; that symbols always belong to symbolic systems. His structural hypothesis is again that behind the diversity of the many myths there exists rules to be discovered. No myth, no element of any myth can be understood in itself. Like the rules of kinship, myths, totems, masks can only be understood if one tries to look into what is said and not said, what is there and not there, and how the different elements relate to each other. To construct a mythology, Lévi-Strauss will employ his method of looking into differences, inversions, oppositions, and disparities.

It is a 'structural' method but it is not so much that a structure actually exists; and this structure does not have much in common with the former models inspired by architecture – from which, for instance, the outdated Marxist model of basis and superstructure came from – or biology. It is more like an astronomic configuration but with more complexity. (In fact, Lévi-Strauss once explained how he was inspired when watching a dandelion in bloom.) For Lévi-Strauss, a structure does not have much in common with a biological entity, it is a tailor-made model constructed in order to reveal the hidden active 'underlying' organization of an observed phenomenon. It is the mode of organization of a sensory realm that turns it into a symbolic system. And, one can neither observe a symbolic system or a language-like one does a biological entity. Therefore, Lévi-Strauss did not find Radcliffe-Brown's comparison between organic structure and social structure appropriate (Lévi-Strauss, 1972(1958): 303). For him, "the term 'social structure' has nothing to do with empirical reality but with models which are built after it" (Lévi-Strauss, 1972(1958): 279).

It is known that myths play a common role. They have a function.

> "What peoples without writing ask of myths, what humanity as a whole has asked of them for the hundreds of thousands of years – perhaps millions of years – of human history, is to explain the order of the world that surrounds us and the structure of the society into which one is born. The aim of myths is to demonstrate the soundness of the world as a whole and that of the particular society [82–83] to which one belongs, to inspire the absolute confidence that they will remain the same as when they were created at the beginning of time"
>
> (Lévi-Strauss, 2013(2011): 82–83)

Beyond this fact, Lévi-Strauss wants to reveal the logical framework of the stories. Thus, it is not so much the stories as such that matter. One again has to look into the different and similar relations between the components, to study the relations the series of components maintain/have with one another. The kind of thinking that myths convey as a whole differs from what is expressed story wise in each myth respectively.
